"Unfortunately, the owners contented themselves with merely stripping the surface, and while they have disclosed a very attractive outcrop of high grade metallurgical ore they had not during 1918 accomplished any cross-cutting or sinking to prove the quality of the ore depth. This, of course, is to be regretted, as in all secondary deposits of this nature, particularly manganese, the deciding factor as regards the value of the deposit is the extent to which oxidation of the original mineral has taken place. That the owners realize the importanec of this is indicated by the fact that they are now engaged in removing portions of the outcrop to prove the quality of the ore for at least ten feet below the surface."

"If the Cowichan deposits are proved to contain a large tonnage of metallurgical ore such discovery would be of considerable importance to the iron and steel interests of this country. At he present time, Canadian iron and steel works are using something over 1,000 tons monthly of ferro-manganese, all of which is imported either from England or the United States, and therefore if a domestic supply of manganese ore can be assumed its utilization should be carefully investigated. The situation of the deposits with respect to the market in Eastern Canada is unfortunate, and it is a matter of doubt whether it would be advisable to manufacture ferro-manganese on the coast, or transport the ore to Atlantic ports via the Panama Canal."

Fatal accidents in the coal mines of British Columbia over the first quarter of the present year totalled two, of which one was caused by falls of roof and rock and the other by mine-cars and haulage.

PERSONALS.

Dr. W. G. Miller is in London.

Mr. R. B. Watson and Mrs. Watson have returned to Cobalt from New York.

Mr. W. E. Segsworth and Mrs. Segsworth left Toronto on Tuesday April 29th for England.

Mr. Frank Horne, and Mr. O. Gillette, have resumed their former duties on the staff of the Dome Mines.

Mr. George J. Miller, president of the Miller Independence Mines returned north last week from Dayton.

Dr. C. K. Leith has returned to the United States from Paris, where he acted as an advisor concerning minerals.

Mr. Malcom Lang, M.P.P. for the Cochrane district, was a business visitor to Cobalt and Haileybury this week, returning to Porcupine Thursday.

Messrs. A. G. Burros, P. E. Hopkins and W. R. Rogers, of the Ontario Bureau of Mines will leave Toronto shortly for field work in the Kirkland lake area.

Mr. J. A. McVichie, former mine superintendent of the Chambers-Ferland mine, will leave Monday evening for the southern states, and may take up residence either in Utah or Arizona.

Mr. T. J. Flynn, manager of the Fort Matachewan Gold Mines, is a business visitor in Haileybury and Cobalt, having come out by way of Elk Lake. Mr. Flynn states that navigation on the Montreal River has opened this week.

Mr. T. R. Finucane, managing director of the McKinley-Darragh mine, and one of the recently appointed new directors of the Dome Mines, has concluded a visit to both properties, and has returned to his home in Rochester.

Mr. N. J. MacAulay, mining recorder for the district of Temiskaming, has returned to Haileybury, after having given evidence in Toronto relative to the boundary dispute between the O'Brien mine and the La Rose Consolidated.

Mr. J. H. Black, general manager of the Northern Canada Power Company, went to Cobalt last week, and is in the Porcupine camp on business. Mr. Black just recently returned from Texas, where he spent about one month on the scene of the present great oil boom.

Among the present day mine managers of the Cobalt camp, Mr. McVichie is one of the first to have engaged in mining in this field. Indeed, Mr. Vichie, together with T. R. Jones, manager of the Buffalo Mine, represent the only remaining members of that first school who did the pioneer work of this greatest of the world's native silver camps.

Mr. McVichie came to Cobalt some fourteen years ago. Since that time he has served as superintendent of the Temiskaming mine, later at the City of Cobalt, and finally at the Chambers-Ferland mine of the Aladdin-Cobalt Company. As a consequence he is widely known among the mining fraternity of the North, where general regret is expressed over his decision to remove to the south.

HEDLEY GOLD MINING CO.

In a report dated March 1, 1919, President I. L. rill says of the Hedley Gold Mining Co.:

During the past year everything at the mine and mill ran fairly well until December, when the excessive cold weather formed so much marsh ice in the river and in our power flume that it caused us a loss instead of a profit and makes our year's profits small.

Our reserves of ore are a little lower in both tonnage and grade, as a result of our running through the war under high prices for everything and with the same price for gold. Still, I think we did right to continue to operate and pay our high taxes, etc., to help win the war.

The mine still looks fairly well, and if prices for labor and supplies come down to near pre-war-time levels we expect to earn a fair rate of interest on our stock; and with more development we hope to get the mine back into better shape.

General Superintendent Gomer P. Jones says:

From January 1st to April 30th, 1918 (the period of operating under the former owner of the property), there was mined and milled 20,028 tons of ore having an assay value of $11.18 per ton; from May 1st to December 31st, 1918, there was mined and milled 47,285 tons, having an assay value of $9.99 per ton.

The general condition of the labor market and cost of supplies that prevailed during 1918 prohibited development of any extensive scale, although we are of the opinion that the mine has not suffered thereby, except that no sufficient new ore has been opened up to replace the total amount milled. We are confident of doing this, however, as soon as the diamond drill is again in operation, at which time we should be in a position to maintain a higher grade of ore.

TAILINGS PLANT AT COBALT LAKE.

The Mining Corporation of Canada during 1918 constructed and put in operation a plant for treating the mill tailing beds in Cobalt Lake.

The plant consists of a pontoon equipped with two powerful centrifugal electric suction pumps, which have a practical capacity of 17,000 to 18,000 tons per month. These pumps deliver the sands and slimes from the lake beds, directly to a classification plant, from where the pulps are carried by belt conveyors to the mill and treated by concentration and cyanide. The pumping plant also delivers a surplus quantity of tailing to a stock pile near the classification plant, which can be drawn on during the cold weather when the pumps are not in operation. During the portion of the season during which the plant was working, 47,465 tons were pumped, of which 17,633 tons were treated in the mill and an extraction of 40,908 ounces were made.

The Hardinge Conical Mill Co. reports the honorable discharge from war service of J. C. Farrant, its London manager. Mr. Farrant for over four years was held a prisoner of war in Germany. 1st, Lieut. J. J. Cadot, of Air Service, A. E. F. returns to take charge of its Denver office. Capt. Harlowe Hardinge, Signal Corps, Director Radio Schools in the A. E. F. will return to his duties as vice-president of the H. C. M. Co. in the New York office. The Hardinge Company anticipates the early return of three more of its staff and a consequent renewal of its highly efficient service to its customers.

CONCENTRATION OF GOLD-COBALT MOLYBDENITE ORE FROM NEW HAZELTON MINE.

Mr. Nichol Thompson, director of the New Hazelton Gold and Cobalt mine on Rocher de Boule Mountain, Hazelton, has received returns on a car of ore shipped from the mine to the Ore Dressing and Metallurgical Laboratories of the Department of Mines, Ottawa, which are particularly interesting because of the wide variety of metals found in the ore and the thoroughly satisfactory recovery of the content by treatment. The full results of the tests follow:

"A shipment of ore was received on August 6th, 1918, from "The New Hazelton Gold and Cobalt Mines," New Hazelton, B.C. This shipment consisted of 669 bags, which gave the following weights, analyses and content: Net weight (wet), 53,772 lbs.; moisture, 1.01 per cent., 544 lbs.; dry net weight, 53,228 lbs. Analysis, sulphide of molybdenum, 1.40 per cent.; oxide of molybdenum, 00.18 per cent.; cobalt, 1.12 per cent.; nickel, 0.60 per cent.; arsenic, 8.98 per cent.; gold, 1.24 ozs. Content, sulphide of molybdenum, 745.19 lbs.; cobalt, 596.15 lbs.; nickel, 319.37 lbs.; arsenic, 4,779.87 lbs.; gold, 33.00 ozs.

"The object of the test was to concentrate the values in the ore and also obtain a separation of these values as far as practical. As the cobalt, nickel, arsenic and gold values were intimately associated it was feasible to concentrate these by water concentration and also to obtain a separation and conceneration of the molybdenite values by flotation."

The shipment was divided into three lots as follows:

"Lot No. 1, test No. 1, dry net weight, 12144 lbs.; lot No. 2, test No. 2; dry net weight, 35,234 lbs.; lot No. 3, test No. 3, dry net weight, 5,850 lbs.

"Lot No. 1, test No. 1: The procedure was as follows: The ore was crushed to 20-mesh and concentrated on a Wilfley concentrator to remove as much as possible of the cobalt, nickel, arsenic and gold values. Two products were made, a concentrate and tailing. The tailings were reground in a Hardinge mill to 60-mesh and the molybdenite concentrated by means of the Callow Pneumatic flotation process. The flotation tailings were re-run over the Wilfley concentrator to further remove any cobalt, nickel, arsenic and gold values.

"Lot No. 2, Test No. 2:—The procedure was as follows: The ore was crushed to 40-mesh and concentrated on a Wilfley concentrator to remove as much as possible of the cobalt, nickel, arsenic and gold values. Two products were made, a concentrate and tailing. The tailings were reground in a Hardinge mill to 80-mesh and the molybdenite first floated in a Callow unit. The flotation tailings were re-run over the Wilfley concentrator and the tailings from the table were considered final and allowed to go to waste.

"Lot No. 3, Test No. 3:—The procedure was as follows: The ore was ground in a Hardinge mill to 80-mesh and the molybdenite first floated in a Callow unit. The flotation tailings were concentrated on a Wilfley concentrator to remove the cobalt, nickel, arsenic and gold values, and the tailings from the table pumped to waste.

This latter test was run to obtain a comparison of results between tabling followed by flotation and flotation followed by tabling.

"The results are contained in the attached tables.

"Conclusions: From the attached summary, the actual recoveries made on this carload of ore were as follows:

"In table concentrates: cobalt, 72.6 per cent.; nickel, 87.5 per cent.; arsenic, 84.9 per cent. In flotation products: molybdenite, 54.4 per cent. These recoveries should be improved upon in practice where a closed circuit could be maintained and the losses due to handling and slime overflow would be reduced to a minimum.

"As the molybdenite values are of secondary value as compared to the other metals present, it is advisable to remove as much as possible of the cobalt, nickel, arsenic and gold values before flotation to recover the molybdenite values. Most of these values can be removed at 40-mesh, and, as it is necessary to grind it to 100-mesh to recover the molybdenite values, it would not be wise to float first and table afterwards, as the loss in cobalt, nickel, arsenic and gold values due to fine grinding would not compensate for the higher recovery of the molybdenite.

"From the test work conducted, the procedure to follow in the concentration of this ore would be as follows: The crude ore crushed in a jaw crusher to 1½ inch or 1 inch and ground in a wet ball in circuit with a classifier to about 40-mesh and concentrated on tables of the Wilfley type; the table tailings reground in a ball or tube mill to 100-mesh in circuit with a classifier and the molybdenite floated in an oil flotation unit; the tailings from the flotation unit concentrated on slime tables or vanners."

A NEW PROCESS FOR TREATING COPPER ORE.

A new process for the treatment of copper ore is being demonstrated in the City of Vancouver B. C. The late A . A. Lockwood and C. J. A. Dalziel, British metallurgical engineers, are said to be the discoverers of this method, for which it it claimed that il will extract copper from the crude ore in twenty-four hours, at a much lower cost than is now involved, and that it will recover not less than 85 per cent of the copper content of the most complex ores. The Lockwood-Dalziel process is described as being the leaching and electrolytic recovery method speeded up by mechanical agitation and other devices hitherto unused in the treatment of copper ores. Filtration and sedimentation are eliminated, much time thus being saved. Then, too, there is the saving of plant, the original investment being reduced so materially in this respect as to make considerable difference in the cost of treatment. It is stated on good authority that the prime object of the demonstration referred to is to prove that the Texada Island property on the Norseman Exploration Company, of Minneapolis, can be operated. This property has been lying idle for years, but now is likely to be opened on a considerable scale. If the new process can make an 85 per cent. recovery of the copper content of the ores, which is reported to have been proved, the claims can be converted into a shipping mine forthwith. A plant may be installed on Texada Island without delay. About $250,000 is said to be ready for the investment and mining men are much interested in watching the development of what promises to be an important new industry.

Platinum in Eby Sulphide Ore.

Platinum values have been found in a large sulphide body in the township of Eby. Heretofore the big vein had been found to carry encouraging values of gold and silver, in addition to a high percentage of sulphur. It was only recently that a test was made for platinum.

Special Correspondence

NORTHERN ONTARIO.

Indian Peninsula Mill Nearly Completed.

The mill at the Indian Peninsula molybdenite property, situated near Ames in north-western Quebec is almost completed, and will be set in operation late in May. The winter roads having broken up, and navigation not yet being open, delays have been met with in the delivery of a number of small parts for the plant.

The flotation process is to be used, the plant having a capacity for treating 50 tons of ore daily, and provision having been made to increase to 100 tons daily when the need for such an increase becomes necessary.

Bald Island.

Mining interests at present closely identified with the leaseholders of the Foster Mine, at Cobalt, are reported to have secured an option on Bald Island, situated in Night Hawk Lake, in the Porcupine district. A narrow vein containing considerable visible gold is in evidence upon the island, and sinking operations are to be commenced. Bald Island lies in close proximity to Gold Island, on which one of the first gold discoveries in this district was made.

Casey Mountain.

Operations have been carried to a depth of 380 feet on the Casey-Mountain property, situated about two miles north-east from the Casey-Cobalt mine. In the course of driving the shaft a layer of diabase some 270 feet in thickness was cut, followed by a layer of conglomerate about 110 feet thick. A strong and well defined vein was followed, and low grade silver values were encountered.

It is now proposed to begin lateral operations in the conglomerate formation at a point about twenty feet above the lower contact.

Motor Road for Kirkland.

All the leading mines of the Kirkland Lake camp are now on record as favoring a first class motor road in preference to a branch line of the steam railway. A petition has been drawn up and presented to the government with a view to inducing the abandonment of the steam railway project.

The consensus of opinion now seems to be that the Government will perhaps welcome the suggestion, and may be very glad to provide a motor road which would cost but $12.000 per mile, or less than one-half the estimated cost of a railway.

Anzac Company Operating Armstrong-Booth Property.

Diamond drill operations are now well under way at the property formerly known as the Armstrong-Booth, in the Porcupine district. The propetry is now known as the Anzac Mining Company.

The property consists of eight mining claims situated adjacent to the Plenaurum property at the east end of Pearl Lake. In the early days of Porcupine this property was explored on surface with encouraging results, but was never operated extensively.

Bewick-Moreing's Interests Sold.

The mining interests of the Bewick-Moreings, in the Porcupine field are reported to have been sold to an American Syndicate. This concern held considerable property in the Porcupine camp, but never conducted aggressive or extensive mining operations. The concern was a heavy holder of stock in the original Hollinger Mine, but disposed of its stock prior to the consolidation of the Hollinger with the Acme Gold Mines, Limited, and the Millerton Gold Mines, and certain building, plants and equipment of the Canadian Mining and Finance Company.

Dome Mine.

The power plant of the Dome Mines Company is gradually being brought into full use. It is understood another 25-drill compressor has been brought into service, thus increasing the capacity to 50-drills.

Miller Lake-O'Brien.

During the week ending April 18th, the Miller Lake-O'Brien mine, of Gowganda, shipped a car containing approximately 64,000 pounds of ore.

The shipment was consigned to the Deloro smelter for treatment.

Working Old Reliance Property.

Operation which commenced on the old Reliance property, near the Kerr Lake mine, have resulted in the production of about 28,000 ounces of silver since late in November. The property is being worked under lease by John Shaw and E. Dean, a small force of men being engaged.

Hollinger.

The current rate of production at the Hollinger Consolidated is the highest in the company's history. The statement just issued which shows $1,368,980 produced during the first twelve weeks of the year, indicates an output of $5,948,405 annually. However, whereas the report covered the period up to March 25th, it is interesting to know that operations have been greatly speeded up since that date. During the period under review the mill ran a little less than sixty per cent. of possible running time, or at an average of 1,646 tons daily. It is considered very significant that such a record should be established on such a tonnage. With the plant working at 98 per cent. capacity, as has been since reported, it is evident the daily average will approximate 2,646 tons. On the basis of $9,15 ore, which the average throughout the mine, an output of $24,310.90 daiy is indicated or about $7,873,478.50 yearly. It is considered probable dividend disbursements will shortly be increased to perhaps one per cent. every four weeks, or thirteen per cent. annually.

Oxford-Cobalt.

Work has been started on the Oxford-Cobalt property, situated in the Gillies Limit directly south from the Kerr Lake Mine. The company owns blocks A-100 and C-1000, it being proposed to sink to a depth of 200 feet on a strong calaite vein which shows on surface, and which carries low silver values at outcrop. The geological conditions are somewhat similar to the Beaver-Temiskaming-Adanac area.

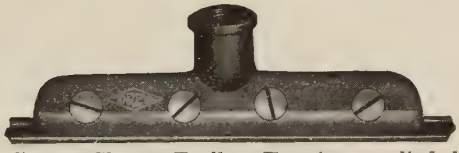
Oil Flotation for Reeves-Dobie.

It is understood the Reeves-Dobie mine at Gowganda, will instal oil flotation equipment, the first plant of its kind to be installed in the Gowganda field.

Mining men throughout Canada are endorsing without reservation the action of the executive of the Canadian Mining Institute in asking the Dominion Government to place a representative of the Mining Industry on the Industrial Commission being appointed to investigate the relationship between capital and labor in the Dominion. The name of D. H. McDougall, president of the Nova Scotia Steel & Coal Company, is put forward in this connection by the Institute.

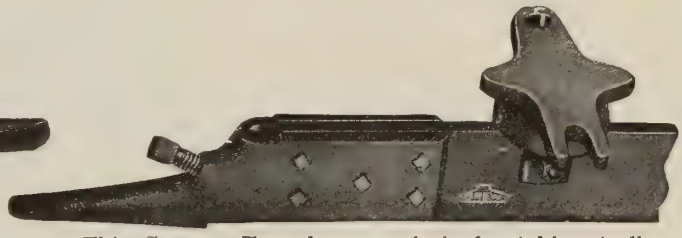
DREW OVERHEAD MATERIAL

This feed-in- Screw Clamp Trolley Ear is made from bronze with horizontal feeder lug to accommodate 0000 size feeder wire. This ear can be furnished tinned if so desired.



This Screw Clamp Trolley Ear is supplied both in malleable where the ears are galvanized by the hot dip process or in bronze. It can accommodate grooved or Figure Eight to 000 size.

This Samson Splicing Ear is installed without special tools, stays upright in the span, cannot make a hard spot in the line and is non-arcing. Repeated service records show that the Samson will outwear the wire in which it is installed under the most severe operating conditions.



This Samson Tunnel approach is for taking trolley into barns, under bridges, elevations or through tunnels where there is a minimum clearance. It is good practice to place the insulated hangers about six feet apart. The tapered "V" shaped lips of the Samson Approach give smooth under-run.

This hanger has a galvanized Clevis with ⅜ x 1½ in. machine bolt, and is for use in connection with the Samson Tunnel Approach shown above.

This hanger is used when the trolley is supported in shallow wooden trough or like places such as mines or structures with low rods. Its height has been reduced to a minimum.

All Drew materials are guaranteed to be free from defects in material and workmanship, and to do the work for which they are designed in a thoroughly satisfactory manner.

Our nearest house will supply you with descriptive literature on request.

Coke Ordered For Grand Forks.

There does not seem to be any immediate likelihood of the Granby Company's smelter at Grand Forks closing down, as an order was placed recently for the shipment of 900 tons of coke weekly from the Fernie Collieries to this plant.

May Operate Smelter on Co-operative Plan.

A. H. Rogers, consulting engineer for the Canada Copper Corporation, Ltd., was in British Columbia recently and conferred with Oscar Lachmund, metallurgical engineer, and a committee of the citizens of Greenwood, with reference to the Greenwood Smelter, now idle, and mining properties of the Canada Copper Corporation contiguous to the smelter. Mr. Lachmund, who is acting in an advisory capacity to the citizens, hopes that some arrangement may be reached whereby the citizens may realize their ambition that the plant should be re-opened and mining operations in the district resumed. Mr. Rogers, it is understood, was asked to place a price on the plant, and it is considered likely that he will do so, in which event the citizens, who are a unit in the matter, may arrange to take over the property with a view to opening it on a co-operative basis. Mr. Lachmund in an interview in this connection said that there was much to encourage the prospector in the country about Greenwood, and in the Slocan division. These fields were likely to become attractive to returned soldiers and their attractiveness would be increased with the carrying out of the government's policy of the establishment of sampling works in various mining sections of the province. He added: "The success which may be achieved in operations on a small scale is illustrated by the performance of Duncan McIntosh, who removed $100,000 in high grade ore from the Bell Mine of Beaverdell District, on Wallace Mountain, in two years, out of which he took up a bond of $26,000 on the mine and a profit besides. Lessees are at work on various claims in this district. The veins are narrow, but they persist into depth, evidence of which is found in the Carmi, which represents a geological level 1,000 feet deeper than the Wallace Mountain claims."

Hyatt Steel Products.

Announcement has been made of the completion of negotiations whereby the Hyatt Steel Products, Ltd., of Granville Island, takes over the Canadian Metals, Ltd., Tudhope Electric Metals, Ltd., and the Steel Rolling Mills at Port Moody, B. C. The new concern thus becomes one of the largest iron and steel industries in Wesern Canada and with the greater facilities obtained through the fusion of interests the company's operations will be considerably extended. The important branch of the industry is steel manufacture, it being asserted that tests conducted at the Tudhope plant, False Creek, have established its practicability. Operating a three phase electric arc six ton furnace, of 1,500 kilowatt capacity, steel has been poured and declared to be of the highest quality. The company's intention is to make the ingots at this plant and roll them at the Port Moody Mills. For some time low phosphorous pig iron has been manufactured at the Tudhope plant. The company has it own power substation.

Concentrator Nearing Completion.

The concentrating plant under construction on the Idaho-Alamo Mining Property, near Sandon, B.C., is nearing completion and should be ready for tests before the tramway, with which it is to be served, is in shape for operation. The plant covers about an acre of ground and the mill, which has a capacity of 300 tons, is costing about $200,000. Its equipment is exceptional in diversity, having been designed to concentrate ores from several mines, and the workmanship is first-class throughout. The mill will be required to dress ores from the Sovereign, Wonderful, Queen Bess and Idaho-Alamo Mines, all of which are owned by Clarence Cunningham and associates, and the development of which is said to have demonstrated that a large tonnage is assured.

Lower Wages.

There is a marked tendency towards the lowering of miners' wages in the Ainsworth-Slocan district as well as throughout the province. A reduction of 25 cents per shift has gone into effect at the Florence mine, and it is likely that similar reductions will take place in connection with other operating properties. It is stated by the management of the Cork-Province mine that operations at the mine on the South Fork will not be resumed unless a 50 cent per shift reduction is accepted by the men. During the past year or so the prevailing scale for miners in the Slocan and Ainsworth Mining Camps has been $5.00 a shift for miners. This rate still is in force in the mines around Slocan. No doubt justification for the smaller scale will be found by the operators in the fact that reductions of $1 per shift have been made in the Coeur d'Alenes and Butte, that forces are being reduced steadily, and that the uncertainty of the metal markets, particularly with reference to lead and zinc, make wage reduction necessary.

Will Dredge for Gold in Yukon.

Confidence in the Yukon's resources is exemplified by two new post-war enterprises. One is the Forty-Mile Power and Dredging Company, backed by New York capitalists, said to include the Eastman Kodak and Curtiss Biplane companies. The company has acquired ninety-six miles of river claims and hydraulic benches along the Forty-Mile River near Dawson. Its capitalization is $5,000,000. The second enterprise is headed by Lewis Titus, pioneer Yukon dredgman, and A. McVicar, of Seattle, Wn., who have secured a dredge which will be taken from McQuestion River this season to dredge the Highet Creek placers. All old-time dredge and hydraulic companies on the Klondyke Rivers are preparing to start the season's operations in May. There is said to be plenty of labor available there at present.

Yukon Needs Railways.

The construction of a line of railway through Northern Alberta and Northern British Columbia to the Yukon is the chief proposal in a somewhat ambitious programme which is being urged by the Yukon Development League in a determined endeavor to bring Canada's great northland in closer touch with other sections of the Dominion. The Federal Parliament has been asked to provide funds for a survey of the contemplated railroad, it being suggested that the line should tap one of the transcontinental roads. It is

ENDURANCE BRAND BALLS

The Steel used in our ENDURANCE BRAND BALLS is an alloy composed of a Chrome and Manganese content. These balls are forged from bars cut into proper lengths, thoroughly heated and then forged under a powerful steam hammer. These balls are then quenched in an oil bath, which gives them the properties of toughness and hardness.

We have found a steel and also discovered a treatment for these balls which gives extraordinary performances in action by resisting abrasion and withstanding shock. All sizes.

PRICES ON APPLICATION

CANADA FOUNDRIES & FORGINGS, Limited

Canadian Billings & Spencer Plant, WELLAND, ONT.

asserted that such a road would open up a richly timbered, farming, grazing as well as a practically unexplored mineral country.

The Yukon territory, containing about 192,000 square miles, more than half of which is habitable, is still practically without railway connections. It is pointed out, in support of the Yukon's claims, that it sent over 600 men to the Great War; gave cash contributions to the war greater per capita than any other section of the British Empire, and up to the present has produced over $200,000,000 in gold.

The Providence Mine.

Greenwood, B.C.— The Providence Mine of this district is reported to be showing considerable activity, development work necessary for more extensive work having been satisfactorily completed. Ten men have been employed all winter and fifty more will be engaged for the summer. One carload of ore has been shipped to the Trail Smelter.

Urge Government Control of Oil Lands.

A resolution urging the Dominion Government to hold in perpetuity the oil deposits of the Province of Alberta and other parts of Canada was passed at a recent meeting of the Canada Council of Agriculture held at Winnipeg, Man. It also is asked that the government undertake the development of these natural resources for the public benefit. In this connection it is interesting to note that several representatives of Western Canadian constituencies have organized a provisional Natural Resources Commission, which probably will develop into a permanent body, and the chief purpose of which is to try and induce the government to adopt a well-defined and permanent policy in regard to the development of the natural resources of Western Canada.

Will Make Carbide on Vancouver Island.

Vancouver Island is to have a new industry. A factory for the manufacture of carbide for export to Australia, New Zealand, and Asia is to be established. Union Bay is likely to be the site for the plant, as it is close to the cheap hydro-electric power of the Puntledge River plant of the Canadian Collieries (D), Ltd. Coke also is available on the spot, and high grades of limestone can be obtained in the vicinity.

Trail Smelter.

The Consolidated Mining and Smelting Company has 8,266 tons of lead that remained unsold on March 1, according to a report from its Trail office. This may be compared with 9,042 tons on February 1st. The receipts in February were 1,435 tons, which increased the surplus to 10,477 tons, but the sale of 2,211 tons made at 7.835 cents a pound reduced the quantity to 8,266 tons. The unsold surplus includes 2,382 tons on hand at the end of October; 1,346 tons made January, and the 1,435 in February. The February price is reduced to 7.61 by the freight adjustment referred to in circulars of July 21 and November 1. The February sales are applied as follows: Balance, August, 35 tons; September, 1,811 tons; to apply to October, 365 tons. "We are settling for September lead at 7.61," says the report. "We still have a balance of about 500 tons to deliver to the Imperial Munitions Board at the War Price."

Gibson Mining Company.

An injunction restraining D. K. May, Minnie M. May, and the Gibson Mining Company from disposing of or in any way interfering with shares of the company, which company is in possession of the Winthrop and Butte Groups of mineral claims on Cariboo Creek, has been continued by Chief Justice Hunter until after the trial. Louis Chassy and J. M. Wolbert are bringing action for a declaration that they are half owners in the claims. In Wolbert's affidavit it is alleged that a transfer o fhis holdings was made on the authority of a power of attorney to which his name was forged.

Privy Council to Decide Title to Coal Lands.

Title to the under-surfaee rights in foreshore lands within what is known as the Esquimalt & Nanaimo Ry. Belt on the East Coast of Vancouver Island will be decided by the Privy Council. At the hearing of the test case which will decide the whole issue Hon. J. W. deB. Farris, Attorney-General for the Province of British Columbia, will represent the Province, leaving for England for the purpose in the month of June. This test action relates to foreshore lands in Chemainus Harbor covering which Provincial licences have been granted to H. W. Treat, of Seattle, Wn. The case has been through the lower courts and in each case, up to the present, the E. & N. Ry. Co. has been defeated. The Privy Council now will decide whether the Province can issue good licences to these coal lands and its judgment, of course, will be final.

Developing New Coal Areas.

New coal areas are being developed both on Vancouver Island and in parts of the British Columbia interior. On the Island licences have been applied for in the Comox district and it is understood that T. R. Stockett, formerly of the Western Fuel Company, Nanaimo, B.C., is organizing a Company in Seattle to develop the coal of these lands. H. W. Treat, of Seattle, also is proceeding with his preparations to open up areas which he has acquired on Chemainus Harbor, apparently confident that the Provincial title which he has acquired will be upheld by the Privy Council. Besides it is authoritatively announced that coal measures two and a half miles south of Kamloops B.C. are to be worked again after many years. Some eighteen years ago the blacksmiths of Kamloops and some of the householders of the community used to burn this coal. James L. Brown, of Vancouver, has held the ground for some time. Accompanied by David Evans, consulting engineer, Mr. Brown has returned from an inspection of the property and, as a result of Mr. Evans' examination and on his recommendation a diamond drill is to be used to determine the extent of the coal measure. The coal is high bituminous in character and the measures are reported by Mr. Evans to be of the same age and series as those of Vancouver Island.

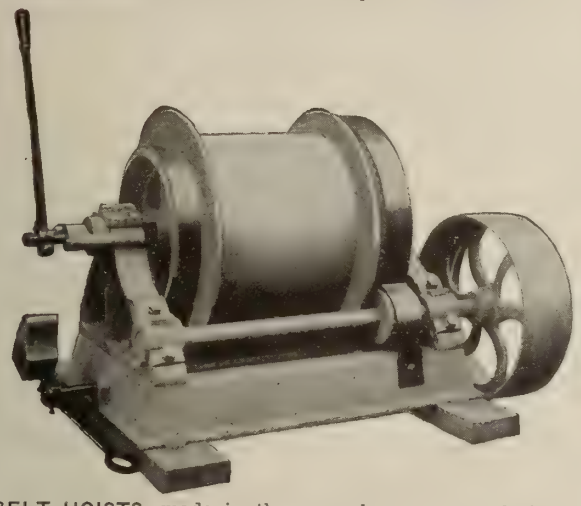
Two Shifts at Galena Farm Mill.

The Galena Farm Mine, Silverton, B.C., is being developed with satisfactory results. Work up to the present shows the vein to be continuous, ore is piled up ahead of the mill, and a considerable reserve of broken ore is available. The mill started recently with two shifts, and will run full blast so long as there is enough water for operation. A. J. Baudette, consulting engineer, thinks the mine's prospects are good.

MINE HOISTS

Steam, Electric or Belt

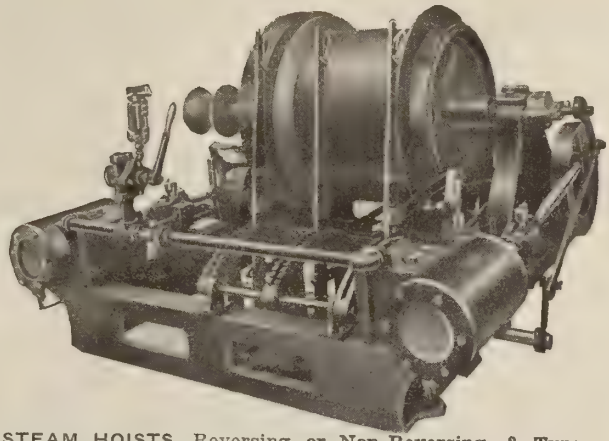
Any size you want up to 50 H. P.



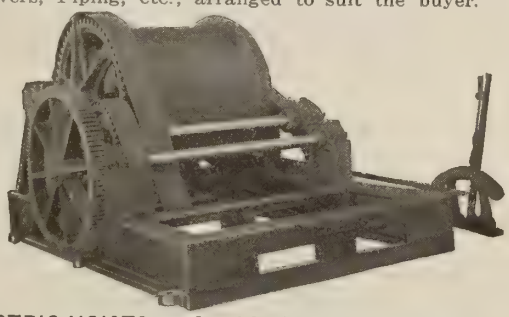
BELT HOISTS, made in the same large range of sizes as the Steam and Electric Hoists.

All our Hoists are properly built to withstand hard usage. They are simple in construction, do not easily get out of order, and the repair bill is exceedingly small.

Send for Catalogue.



STEAM HOISTS, Reversing or Non-Reversing, 2 Types—Drums Friction Driven, or keyed to shaft. Operating Levers, Piping, etc., arranged to suit the buyer.



ELECTRIC HOISTS, made with either Fixed or Loose Drums. Hoist above illustrated has Fixed Drum, Intermediate Gears, and extended base ready to receive the motor.

MARSH ENGINEERING WORKS, LIMITED, Established 1846. **BELLEVILLE, ONTARIO, Canada**

Sales Agents: MUSSENS, LIMITED, Montreal, Toronto, Winnipeg and Vancouver

Canadian Collieries vs. Pacific Coast Coal.

An action is in progress in the Courts of British Columbia in which the Canadian Collieries (D) Ltd. are the plaintiffs and the Pacific Coast Coal Mines, Ltd. the defendants, the suit being for damages for trespass and for an accounting and payment for coal alleged to have been taken from the Alexandre Mine Property, South Wellington in 1911. The plaintiffs maintain that the coal was taken without their knowledge or consent and it is understood to be the plea X of the defendants that whatever was done by them was with the consent of the plaintiff company's officials.

Settlers' Coal Rights.

With further reference to the Settlers' Rights Act of British Columbia, which was disallowed by the Dominion Government in 1917 and on being re-eacted by the Province last year was refused the signature of the Lieut.-Governor, it is interesting to note that the Vancouver Island Settlers interested are making a move to bring their case directly to the attention of the Federal Government. Meetings of those who have property without the coal rights therein have been held and it is probable that a delegation will leave the Pacific Coast shortly to carry the grievances to the ears of those in control at the Canadian Capital.

Will Work Leach River Property.

The Leach River, Vancouver Island, is likely to be worked on a large scale for gold, platinum and talc. A company is being formed for the purpose and some of the necessary plant already is on the property. The Leach River is familiar to all old timers. Fifty years ago it was the scene of some excitement, and for an extended period was popular with the individual placer miner. In fact the river bed and benches have been worked on and off ever since, and it is seldom that one cannot obtain colors by washing out a pan.

Building Small Furnace for Maple Leaf Mine.

The Maple Leaf Mine is putting in a small smelter at Franklin Camp to treat its ores. The furnace is being made at Grand Forks, and will have a capacity of 50 tons a day. The furnace has a dimension of 44 in., and is of cupola type. A 35 h-p. gasoline engine will be used to drive the blower. The ores which are to be handled contained chiefly copper and silver values, although assays made last summer by a government representative disclosed small amounts of platinum.

Copper Mountain Railway Builders Strike.

The construction of the branch railway to Copper Mountain, where is situated the newly developed mining property of the Canada Copper Corporation, has received a temporary check. Three hundred laborers employed by the contractors have laid down their tools and refused to go back to work. They claim they were asked to work 10 hours a day at the same wage as was given for 9 hours' work. Now they want an 8-hour day and a fixed wage of 50 cents an hour, or $4 a day. The strikers are orderly, no trouble having been experienced in the little towns of Princeton and Allenby, which are the communities nearest to the mining camp.

CUT GEARS

All Types - - - - Any Size

Mine Winding Engine for Immediate Disposal

Specifications:—

Double Drum, double Cylinder, direct drive high-speed Winding Engine, Cylinders 14 x 42. Reverse Link Motion. Pistons 21¼" diam. Cross head shoes adjustable to take up wear between the slides. Running in V shape slides; Length of Engine Bed Castings (suspended) from rear cylinder cover in centre drum shaft, 16'; Solid Crank Wheels 4' diam., 3½" Rim, keyed on to Drum Shaft 6½" diam. Hollow Drums, 3'6" diam. x 4' Winding Space, Flanges 3'. Each Drum fitted with adjustable Expansion Clutch operating inside outer rims. Each Drum fitted with Band Brake—operated by Independent Levers. Overhead Throttle with Drop Lever and Lubricator.

Lever Bank:—1, Engine Reverse Lever; 2, Brake Band Levers; 2, Clutch. Long Powerful Levers operating on floor stand quadrants.

GEOLOGICAL SURVEY REPORTS.

The Geological Survey has published a summary report on work done during 1918 in British Columbia and Yukon. The authors are W. E. Cockfield, C. Camsell, V. Dolmage, B. R. McKay, S. J. Schofield and M. F. Bancroft. Mr. Cockfield reports on Mayo area, Yukon and silver-lead deposits of the Twelvemile area, Yukon. Mr. Camsell reports on mercury deposits of Kamloops lake; boring operations for oil in the vicinity of Vancouver; the Copper Mountain area; and platinum investigations. Mr. Dolmage writes on Quatsino Sound and Mr. MacKay on Cariboo gold fields. Mr. Schofield reports on Britannia map area and Ainsworth mining district. Mr. Bancroft reports on Lardeau map area. These gentlemen are to be congratulated on getting their reports ready for publication in a reasonable time.

SOME PLAIN TALK.

Col. Thomas Cantley, in his presidential address to the Mining Society of Nova Scotia spoke strongly against the tendency to favor putting all industries too largely under government control. He wants captains of industry to be allowed to get back to work.

Industries during the war were properly taken more largely under government control for war purposes. There has since been a desire on the part of many to see government control continued and made more complete. Others consider that the industries enlisted for war purposes should now be unfettered, and allowed to develop according to the ability and energy of the individuals connected with them. Our readers will find Col. Cantley's address elsewhere in this number.

MINING INSTITUTE MEETINGS.

An account of the annual meeting of the Mining Society of Nova Scotia, held in New Glasgow, is given in this number of the Journal. Much of the credit for the success of this meeting belongs to Mr. F. W. Gray of the staff of the Nova Scotia Steel & Coal Co. Our readers will be pleased to learn that Mr. Gray, who is an authority on the coal mining industry, is joining the staff of the publishers of this Journal and will be Associate Editor of the Journal. Mr. Gray will devote his attention chiefly to coal mining and to general mining in the Maritime Provinces.

In concluding his comments on the New Glasgow meeting, Mr. Gray makes some suggestions respecting meetings for consideration of members of the Canadian Mining Institute. We would be pleased to have comments on these suggestions, with a view to making the meetings more useful to members and the industry.

We have one suggestion to make. It is that some endeavor should be made to have, during the summer, local meetings in some of the mining camps, which would be made sufficiently attractive to bring men from other parts of the same province at least. For instance we might this summer have in Ontario visits to the gold and silver mining centres. To attend such meetings we would invite all interested in the mining industry.

MINING.

Recent discussion among members of the Canadian Mining Institute makes it more than ever evident that the term "mining" is understood to mean very different things by different persons. Some of the metallurgists, notably those in the iron and steel industry, like to consider that mining is the proper term to apply to the taking of ore from the ground, while the term metallurgy should be applied to the processes for winning the metals from the ores after the mining has been done. This would be in accordance with test book definitions. The term "mining" is, however, commonly used in a much wider sense.

A mining company that limits its attention to the extraction of ore is the exception rather than the rule in Canada. For many years gold mining companies have considered it their business to produce metallic gold, but none have found it desirable to call themselves gold mining and metallurgical companies. The latter term is superfluous in this connection.

We have before us the report of the Nipissing Mining Company for the year 1918. The report shows that the company produced and shipped during the year silver bullion worth $5,485,427, and residue and concentrates worth $352,099. We find in this report a detailed analysis of the cost of treating the ore. We find remarks on metallurgical problems as well as underground development. We find a record of income and expenditure; of exploration, development, and production; of costs and profits. This is the ordinary business of a mining company. Metallurgy is a necessary branch of mining as the term mining is used in the mining business. Managing ability, commonsense and good salesmanship have, however, their place in this industry as in all others.

OUTLOOK FOR COBALT SILVER MINES IS PROMISING.

The removal of restrictions on the price of silver seems likely to result in an advantage to producers. At the ruling prices there is assured successful operation of many mines at Cobalt. If the price goes much higher a market will be made for very low grade ore. This will lead to further exploration of supposedly worked-out properties. The Cobalt area has as many lives as a cat. It is particularly fortunate that the high prices have been obtainable during the period of high costs, for otherwise much silver that has been marketed would have remained in the ground. An excellent opportunity to get out an exceptionally large percentage of the silver in the Cobalt area is afforded by the present price of the metal. If, as seems possible, the price rises materially, an even more complete clean up than has ever seemed likely will be made. Cobalt has a wonderful record in many ways. It has made not only a very large production of silver, but it has done so at an unusually low cost. The demand for the metal seems likely to add further laurels to Cobalt, for the price warrants every attempt being made to increase the percentage of recovery.

MANUFACTURERS IN CONVENTION.

The twenty-fourth annual convention of the National Association of Manufacturers will be held at the Waldorf-Astoria Hotel, New York, on May 19, 20 and 21. The convention will discuss prevalent forms of social and industrial unrest, government of railroads, government, supervision and stabilizing of trade prices, federal revenue and tax legislation, employment relations, the employer's duty to provide jobs for soldiers, the approaching revision of patent laws, the industrial legislative outlook, and vocational training.

WESTERN ONTARIO IRON ORE DEPOSITS.

In this number a correspondent calls attention to Ontario's undeveloped iron ore resources. The war has directed the thoughts of all to the importance of iron and coal mining industries. Under the circumstances our correspondent's remarks are very timely. He does well to point out that while comparatively little investigation has been carried on, we are too ready to assume that the development of iron ore in Western Ontario is not commercially feasible at present.

It is true that we do not know much about our iron ore deposits. A large part of the little work that has been done, has been done by and for Americans interested in the Lake Superior iron ranges. We have benefitted to some extent by such work, but it is high time that Canadians made some endeavor to determine the nature and value of our deposits. We should have the iron areas examined and geologically mapped with a view to directing attention to the more promising areas and assisting those who undertake development.

CHICAGO MEETING—A.I.M.M.E.

The American Institute of Mining and Metallurgical Engineers will hold its convention in Chicago, September 22nd to 26th. This meeting promises to be one of decided importance to the industry, as subjects of vital concern will be under discussion.

In addition to the technical talks, an elaborate social programme is being arranged and excursions by the Institute as a body are planned to many points of interest in the vicinity, including the Steel Mills at Gary, the oil refineries at Whiting, metallurgical plants at East Chicago, and North Chicago, and to the LaSalle district, where the cement, coal and zinc industries are represented.

DOMINION ENGINEERING AND INSPECTION CO. OPEN VANCOUVER BRANCH.

The Dominion Engineering & Inspection Company, engineers and chemists, of Montreal, have recently opened an office in Vancouver at 44 Canada Life Building, Hastings Street West, under the management of Mr. John B. Croly, who is well known to engineering and construction interests in this district.

The business built up by this company in Montreal, Toronto and Winnipeg, has been conducted along sound professional lines, and it is interesting to note the company's confidence in the future of Vancouver and British Columbia generally, in opening an office in this province.

THE CANADIAN MINING MANUAL.

The publishers of the Canadian Mining Journal announce the appearance of a new edition of the Canadian Mining Manual. The editor has endeavored to make this a useful handbook for those interested in Canadian mines and minerals. Some idea of the contents of this manual will be found on another page.

MOLYBDENUM AND TUNGSTEN.

A communication has just been received by the Department of Mines from the Colonial Office, London, announcing a change in policy in regard to the purchase of molybdenum and tungsten ores. The communication states: "During the war the production of these ores throughout the world has increased enormously, while the demand has since the date of the Armistice greatly decreased. The stocks in this country, or on the way will be more than enough to meet the requirements of the United Kingdom for at least eighteen months. If the arrangements by which His Majesty's Government buy the Empire output of these ores are continued, by the end of 1919 there will be in stock in this country enough to meet the requirements of the United Kingdom, home and export trade for no less than two years, and as these stocks will have to be realized at a price not higher than the world's price, which will presumably be much lower than that now paid by His Majesty's Government, there will be for two years no market in this country for Empire ores and the effect will almost certainly be that many mines within the Empire will have to close down, and the result to the future of the industry might be disastrous.

In the circumstances the only satisfactory solution for both His Majesty's Government, and the producers, appears to be an agreement by which the Empire output and shipments to this country will be drastically reduced for the present, thus allowing stocks to be realized and the world's market to settle down so that the industry might resume normal working as soon as possible. Consequently the Minister of Munitions has decided to terminate the existing purchase arrangements at once, and will not accept delivery of any tungsten ore or molybdenite loaded from British Oveasea ports on ocean steamers after the 30th of April.

In addition, the Minister of Munitions hopes producers in their own interests will take immediate steps to reduce the production of these ores."

On April 29th before Mr. Chas. Macnab, Magistrate of the County of Carleton at Ottawa, Mr. A. S. Munich, Manager of the Kingdom lead mine at Galetta, was fined $100 and costs for allowing a cage to be used for the raising and lowering of men which was not equipped with safety devices as required by the Mining Act of Ontario.

Carbide Lamps.

The Justrite Manufacturing Co., Chicago, has just issued a catalogue illustrating miners' carbide lamps. A large number of lamps are shown and specifications given. The catalog is of the loose leaf pattern and the company plans to keep its customers supplied with complete up-to-date illustrations of its products.

Meeting of the Mining Society of Nova Scotia

The twenty-sixth regular Annual Meeting of the Mining Society of Nova Scotia was held in New Glasgow on the 23rd and 24th of April, about seventy-five members and visitors being in attendance. The occasion was the first on which the Annual Meeting had been held outside of Sydney since the Society's headquarters were moved there from Halifax. The Council had some hesitation in selecting New Glasgow, as it was feared the distance from headquarters might cause a meagre attendance, but on the other hand it was felt that some consideration of the claims of the Mainland members was required, and that further, New Glasgow was not far away from Halifax, and was more convenient for visitors from the West.

Col. Cantley's Address.

Colonel Cantley, the President was in the Chair, and following the transaction of routine business in the opening morning session of the 23rd, delivered the presidential address, which is published elsewhere in this issue of the Journal.

Mr. Cole's Paper on the Salt Industry.

At the afternoon meeting Mr. L. H. Cole, of the Mines Branch, presented a paper dealing exhaustively with occurrences of salt and brine in Canada, and the salt industry as a whole. Mr. Cole's remarks were chiefly descriptive of the numerous and excellent lantern slides shown, which illustrated the recovery of salt from sea water, from brine springs and crystalline salt deposits. An interesting feature was Mr. Cole's full explanation of the varied methods of evaporation used in concentration of brines, most of which was in the nature of new and fresh knowledge to the coal and metal miners and steel men who composed a very representative Nova Scotian gathering. Description of the important salt industry and its outgrowth of chemical industries in the neighborhood of Windsor, Ontario, came as a surprise to most present, who had not realized that a second and greater Northwich had arisen. Special interest, however, centered around the recent discovery of rock-salt at Malagash, Cumberland County, Nova Scotia, which was fully described in a recent issue of the Journal by Mr. Cole, and is now being developed by Messrs. Chambers of New Glasgow.

In this connection Dr. Hayes of the Geological Survey mentioned a reference made in 1840 by Dr. Abraham Gesner, one of the geological pioneers of the Maritime Provinces, to the presence of salt springs in the district of Malagash, and pointed out the necessity to trace the brine flow to its crystalline source, and the possibilities of a salt industry to supply the requirements of the "British Provinces," remarking that the "infancy of the colony was but a trite apology for backwardness in development of natural resources!"

Mr. Cole's talk and the lantern slides were much appreciated, and the Department of Mines does well to pay attention to the non-metallic minerals of Canada, and does still better in making its work known.

The Council of the Society, bearing in mind the interest of its members in steel manufacture and coking processes hopes that Mr. Cole at the next Annual Meeting may tell them something of the silica deposits of Canada, and the resources of the Dominion in refractories.

Refractories.

A paper descriptive of some important developments in the home manufacture of refractory bricks and shapes by the Dominion Iron & Steel Company had been looked for, but it was thought better to leave this paper until the results obtained were more definitely ascertained and tested. Although Nova Scotia, so far as is now known, is unfortunately short of high-grade refractory clays, there is an abundance of silica in occurrences of great purity, and Nova Scotia does not expect to be always so dependent on outside sources for refractories as is the case to-day. It cannot be said that as yet the clays and shales associated with the coal seams are either known fully or tested for suitability to any appreciable extent, and the very close resemblance between the coal measures of Nova Scotia with those of other countries where valuable clays are found in association with the Millstone Grit and the productive Measures, indicates that hope for the discovery of better clays than are now known is well founded.

"Romance and Rascality in Mine Promoting."

Mr. C. M. Odell removed any tendency to stiffness which may have lingered in the meeting by a contribution on "Romance and Rascality in Mine Promoting." The title of this paper had been wrongly printed in advance as "Romance and Rascality in Coal Mining," but the speaker explained that he knew of no reason to think that coal mining was more distinguished in regard to romance or rascality than other kinds of mining.

Mr. Odell's satirically humorous philosophy has come to be rightly regarded as one of the features of the Mining Society's annual gathering. To those who are acquainted with Mr. Hoover's translation of Agricola the following excerpt from Mr. Odell's remarks will seem reminiscent, and show how great minds have thought alike in all ages. Mr. Odell speaks thus:

> "The lure of the wanderlust and the innate gambling instinct of the Anglo-Saxon lead men to the mining camp and the lumber woods. The thirst for wealth drives men to discovering mines and a philanthropic instinct prompts them to offer the stocks and bonds to a guileless public, whose desire for easy money is in inverse ratio to their ability to acquire it. Faced with the problem of gazing at a mean ticket with the rim all punched out, the young man gravitates between going into politics promoting a mining enterprise. This last-named, i.e., promoting, seems to be the safest method of prying a living loose from this earth; as trying to get a dividend from a mine by legitimate means — for the original investor — is about as hopeless as setting a hen on a porcelain door-knob and expecting her to hatch out a row of miners cottages."

Mr. Odell enlightened the Society as to the probable origin of a well-known description of a mine. At the time when the promoter's of King Solomon's Mines were flooding the Nile Valley with watered stock, the chief advisor of Rameses II is reported in conversation with his master as follows:

"Rammy, my boy, Rammy," sez he, "Rammy, you're right, a mine is a hole in the ground, and the owner is a liar!"

Mr. Odell's admixture of modern instance with ancient fable did not prevent him from giving the members some real information on early mine promotions in Nova Scotia.

"Tunneling on the Western Front."

Lt. George Morley, M.C., formerly on the survey staff of the Dominion Coal Company, and now invalided home from active service gave a paper, illustrated with diagrams, on "Tunnelling on the Western Front," which will be found elsewhere in this issue. Lt. Morley was intimately connected with some of the major tunnelling operations of the Canadian forces near St. Eloi and with the large mines whose explosion preceded the taking of the Messines Ridge. He gave a well-deserved tribute to the resourcefulness and gallantry of the Nova Scotian miners in the tunnelling companies.

The vote of thanks which followed Lt. Morley's paper was not the merely perfunctory thing that sometimes follows the reading of papers. The modesty of his manner, combined with the sober reality of the scenes and occurrences he described — scenes in which many of those present were intimately interested because of the letters received from friends and relatives who had taken part therein—made Mr. Morley very welcome. The interesting details elicitited from the speaker during the discussion strengthened the belief that some valuable additions to technical practice will be the result of the operations of our tunnelling corps, who in the course of hazardous warfare undertook experiments in the use of explosives, and in mining practice generally that under our rigid mining laws could not be tried in civilian life.

COL. THOMAS CANTLEY,
President, Mining Society of Nova Scotia.

Lt. Morley's references to the magnitude of the shaft sinking operations was rather a surprise to his hearers. Mine shafts from 120 to 150 feet deep are first class operations in themselves, without any of the additional difficulties imposed by war conditions.

The Wabana Iron Ore Deposits.

The evening session of Wednesday consisted of a paper by Dr. A. O. Hayes of the Geological Survey on the origin of the Wabana Iron Ore Deposit, in Conception Bay, Newfoundland. Mr. Hayes's monograph on the Wabana Deposit published by the Mines Department at Ottawa is the fullest and most authoritative account of this remarkable deposit yet written, and as Dr. Hayes was to speak in New Glasgow, a community always deeply interested in the iron ore mines at Wabana, the Council issued invitations to a number of local residents, who were present in addition to the members of the Society.

The meeting was presided over by Mr. R. E. Chambers, the mining engineer of the Nova Scotia Steel & Coal Company, whose part in the development of the Wabana ore is not perhaps appreciated outside the circle of his associates. Colonel Cantley quite properly remarked "that for the knowledge we have of this valuable body of ore, and for its development, both the Dominion and the Scotia Companies, and the Province, owes Mr. Chambers a debt of gratitude greater than to any other man alive or dead."

Mr. Chambers briefly related his experiences from the time he first examined the Wabana exposures in 1893, and referred to the completion of the two main haulage slopes which now are handling the ore extracted from the practically unlimited submarine areas of the Nova Scotia Steel & Coal Co. at a distance of over two miles from shore.

Dr. Hayes described the deposit carefully and at length, with the assistance of excellent slides, but the most informative part of his talk was his references to the boring algae which seemed to have taken so prominent a part in the formation of the spherules which combine to make the oolitic hematite of which the Wabana ores are so largely composed. Many of Dr. Hayes's auditors were men who daily life was spent in dealing in one form or another with Wabana iron ore, and had doubtless not suspected the existence of the fairy-land of deduction through which Dr. Hayes led them. One begins to realize how hopeless it is for one man to compass entirely even one branch of applied science in these days, for in Dr. Hayes's short lecture he quoted proofs elicited by zoology, by petrology, by chemistry, by geology. How many sciences have been utilized to perfect the naturally colored micro-photographs of rock sections that were shown, who shall say? The net result of Dr. Hayes's remarks appeared to be that while he would not hazard the assertion that the boring algae were the real originators of the Wabana ore seams, these minute and fragile organisms played a prominent part in their deposition. Dr. Hayes intimated that he did not favor the replacement hypothesis, the inference of which

would be that the Wabana ore seams will be found to persist over the whole of the basin in which the original sediments were laid down, apparently under conditions of absolute quiescence.

Colonel Cantley in the discussion said the striking part about Wabana was the relatively small amount of ore in the land areas compared with the tonnages that are practically proved to exist under the sea. Colonel Cantley remarked:

> "The volume of ore is so great that it presents a new feature in mining, to this extent, that it will make practically no difference, not only to this generation, but to several generations to come as to what rate of extraction is carried on at Wabana."

Dr. Hayes made a suggestive statement as to a great similarity between the Wabana ores and those found in some parts of Nova Scotia, more particularly near Mira Bay.

The unique character of the Wabana deposit, the enormous quantity of ore known to exist, its relative importance in the world's markets, and its still greater relative importance as an Imperial asset, and the unprecedented distance from shore at which ore is being mined in the under-sea operations, are matters on which much could be written, and matters which were only touched upon in the evening's proceedings.

Visit to Allan Shaft Colliery.

The morning of Thursday the 24th was occupied by a visit to the Allan Shaft Colliery of the Acadia Coal Company at Stellarton, where the visitors were shown over the surface-plant by Mr. Notebaert, the mining engineer, and others of the Acadia Company's staff.

The Allan Shaft is equipped with what is probably the largest steel-bankhead in Nova Scotia, having a capacity to handle 4,000 tons of coal daily. The shafts are the deepest coal-shafts in Eastern Canada, being over 1,000 feet deep and brick-lined. The power-plant, boiler house, ash-handling equipment and other surface erections are of the most modern and efficient type, and have all been fully described in previous issues of this Journal.

Visit to Steel Works.

Following the visit to the Allan Shaft the members were taken to the works of the Eastern Car Company, visited the shipbuilding yard of the Nova Scotia Steel Company, where two 2,800 ton steel ships are now being built for the Canadian Government, and went through the Steel Works at Trenton.

The plant of the Eastern Car Company is large and of the most modern description, and the visitors must have realized that in a very short time and in a small radius, they were able to inspect a modern colliery, a steel-car works of the latest type, a ship-building plant, and a steel works which during the pressing times of 1917 and thereabouts saw 5,000 men and women turning out shells in extremely large quantities. and played also an important part in providing heavy marine forgings for the numerous "lame ducks" which made Halifax during war days. While small perhaps, compared with other industrial centres in Canada, there are not many places which can show so complete a microcosm of the coal industry, and its "homologues" if one may be permitted to use the term. For after all, every one of these industries is an outgrowth of the mining of coal.

Air Consumptlon in Collieries.

At the afternoon session a paper by Mr. John Casey, manager of Dominion No. 4 Colliery, was read in condensed form by proxy—in Mr. Casey's absence—on "Some Economies of Air Consumption in Collieries."

This paper was a valuable contribution, from actual experience, of the economies which are possible in the use of compressed air underground by using all possible checks against leaks, and more particularly by the use of an air-meter designed to record not only pressure values but actual quantities of air in cubic feet. Mr. Casey pointed out that friction in air lines was just as fruitful a source of friction losses as it was in water pipes, and that in extending the air system, sound judgment is required to allow for the proper pipe sizes and the keeping down of the velocity of the air to a minimum.

The use of an air-meter will detect air-driven machines, such as hammer-drills, "punchers" and other forms of cutters that are wasteful of air, and will oftentimes show that a new air-chest, or possibly a new machine, would be less expensive than the waste of air and loss of efficiency that more often than is suspected arises from worn-out parts or antiquated types of air-driven machines.

The loss of air and pressure from leaky hoses, and from leaky hose-couplings is another prolific source of complaints of insufficient compressor capacity. It is not the large and noisy leak that runs away with the compressor yield. It is the numerous small leaks, "bleeding" hoses, and wasteful tools which in the aggregate make many compressed air installations so inefficient.

The discussion which followed was a really worthwhile one, for it was participated in by men who had many years of intimate experience with air as a motive power, both in surface and underground operations, and in coal and iron-ore mining, and also in open limestone quarrying on a large scale.

Mr. J. S. Whyte, of the Acadia Coal Company, mentioned an actual experiment when the compressors were run on a Sunday with no pressure on the line, and no air being used. The pressure built up from nothing quite rapidly, but in about twenty minutes the pressure reached a maximum and the curve flattened. Though the compressor was kept running at full capacity, the pressure did not increase, so that a point was actually reached, with no air in use, when the entire capacity of the air-compressor was taken up by the leaks.

There is no reason to suppose that this experiment could not be repeated in many mines with similar results.

It was very evident from the keen interest shown in the discussion that Mr. Casey's paper had raised a topic of first-class importance. The matter is one which is of especial interest to Cape Breton collieries mining undersea areas. The only motive power we now know of that can be economically transmitted for five to seven miles from its source of origin, or entrance into the mine workings, is electricity, which is to-day looked upon as largely inadmissible because of its danger in the presence of inflammable gases. If electricity cannot be made safe for underground use in the undersea areas, then the undersea coal cannot be worked beyond a very limited distance from shore, but it is hardly necessary to admit at this time that man's invention will not overcome what is after all a matter of detail. One method in which electricity can be utilized will be to compress air at some point underground, sufficiently near to the working faces to enable the air to be utilized under conditions of

maximum efficiency to operate air-driven coal-cutters; and here those who favor the use of compressed-air will have an excellent field in which to demonstrate the possibilities of its efficient use. Indeed, if they cannot do this, they must yield the field to some other motive power.

The Pictou Coalfield.

A series of notes on the Pictou Coalfield and more particularly the part of that field contained in the areas of the Acadia Coal Company had been compiled by Messrs. J. J. McDougall(assistant to the Mining Engineer, and G. A. McHattie, surveyor, both of the Acadia Coal Co. and was read by Mr. McDougall. The completed paper will be forthcoming at a later date.

Mr. McDougall detailed the thickness of 18 seams of coal some of them 30 and exceeding 20 feet in thickness, which are present in the Stellarton section of the Pictou Field. The number and thickness of the seams in a comparatively shallow depth of strata is extraordinary, and certainly not paralleled elsewhere in Canada. An interesting statement to those who know the Pictou Field is that the presence of the Ford Seam has been proved to the north of the Allan Shaft within a hundred feet from the surface, but the actual outcrop has not been discovered.

The Pictou Field is a geological puzzle, the solution to which is probably not to be found from explorations in the limited area of the coalfield itself. The coalfields of Cape Breton, of Pictou County, of Springhill and Joggins, and of New Brunswick, including the possibly concealed coalfields lying to the south-west of the Springhill coal exposures, cannot be disassociated from each other in considering the problem of any one field. A study of the tectonic geology of the great Carboniferous basin of deposition which extends over a great part of New Brunswick, Nova Scotia, and the Gulf and continues far into Newfoundland, may throw light on the limits of the known coalfields, where these are obscured by the presence of newer overlying sediments.

Great interest attaches in New Glasgow to the persistence, or otherwise of the coal seams under the New Glasgow conglomerate, but while the explorations of the Acadia Coal Company have yielded valuable information on the internal structure of the Pictou Field, they have not thrown any definite light on this question. Boreholes have been put down in the Conglomerate, but the results were negative, particularly as they could not be tied up with known conditions because of the absence of intermediate boreholes.

Confirmation of Early Work of Logan and Hartley.

It was pointed out that the information obtained by the Acadia Coal Company's diamond drill boreholes was most striking confirmation of the accuracy of the work of Messrs. Logan and Hartley, who in 1869 reported the same number of coal-seams, from purely surface observations, that have to-day been proved by diamond bores sunk through the floor of an extensively worked seam (the McGregor seam). Naturally the particulars of the seams given by Hartley and Logan were not so exact as those revealed by the cores of a diamond drill, but when one considers the unknown character of the Pictou Field in 1869, and the unreliability of surface indications, the painstaking and conscientious nature of the work accomplished by these public servants of fifty years ago calls for some recognition.

More Mapping Needed.

Reference was made by several speakers to the out-of-date and inadequate condition of the geological maps of the coalfields, which have to a large extent remained as they were drawn by Hugh Fletcher. Dr. Hayes spoke of the accurate and painstaking work of Fletcher, a geologist whose memory needs no enconium to Nova Scotians. He mentioned the depleted nature of the Geological Survey Staff on account of the war, and while it was generally felt that during the war probably neither the men nor the money were available for the not absolutely necessary work of revising the geological maps, that in the past insufficient attention had been paid to Nova Scotia. Dr Hayes mentioned that the Survey was undertaking to map certain portions of the Joggins Coalfield (where a number of collieries are now operating), which have not been previously mapped. This is the district that the late Hugh Fletcher was engaged in mapping when he died.

The meeting was also pleased to learn from Dr. Hayes that Dr. Wight, Professor of Geology at Acadia University, was detailed to conduct investigations into the oil shales of Pictou County during the ensuing summer.

Mr. D. H. McDougall's Address.

The meeting, on the motion of Professor J. H. Sexton, which was seconded by Mr. C. M. Odell, passed a vote of congratulation to Mr. D. H. McDougall, past-president of the Mining Society, on his election to the presidency of the Canadian Mining Institute.

In replying, Mr. McDougall gave an account of the activities of the Canadian Mining Institute, and indicated the aggressive policy which the Council had outlined for the future of the Institute, particularly the intention of the Institute to become a factor in the framing of mining legislation. President McDougall also referred to the stand which was being taken by the C. M. I. and also the Engineering Institute on the question of inadequate salaries now being paid to public servants of technical departments. He also mentioned the suggestion which the Institute had made to the Federal Government to grubstake prospecting parties of returned soldiers, and the undertaking of the Institute to superintend the work of these parties. Mr. McDougall expressed his belief that the union between the Mining Society and the C. M. I. had been a proper and desirable thing, and that his own selection as President of the Institute was one result of the union, which generally had brought the members of the Mining Society of Nova Scotia into closer touch with the literature and movements now energizing the technical societies of North America.

Resolutions.

During the course of the Sessions a number of resolutions were passed. The Mining Society joined its forces to those of the Canadian Mining Institute and the Engineering Institute of Canada in the matter of technical salaries, it being resolved to

> "Respectfully urge upon the Dominion and Provincial Governments the pressing need of paying better salaries to those civil servants who are technical officers of the Department of Mines and similar services."

The following resolution was sympathetically received and passed, following remarks on the record of the Nova Scotians in the war from the President, Colonel Cantley, and from the past-President, Colonel Mc-

Dougall, who spoke in this connection as President of the Canadian Mining Institute. The resolution read:

"The Mining Society of Nova Scotia takes the opportunity of the first Annual Meeting following the defeat of our enemies to express its sense of the honor reflected upon the industries and profession it represents by the very gallant record of Nova Scotians on the fighting fronts.

"Our Society will keep in sacred memory those who fell, and desires to honor those who have so nobly served."

Following this resolution the Society very properly recorded:

"Its recognition of the duty of its members to assist in every way the re-establishment of returned soldiers in civil life."

Professor Sexton's Address on Repatriation.

In speaking to this resolution, Professor Sexton, whose work in the vocational training of disabled soldiers is so well known, said:

"I am glad this resolution has been moved. I find that the barometer of sympathy for returned men has lately been dropping. The greatest support we are getting is from the large industries of the Province. Soon after the declaration of war the Dominion Steel Corporation and the Nova Scotia Steel & Coal Company promptly declared they would take back all their enlisted men returned from overseas, and who had been on their payroll when they volunteered. I am glad to say they have lived up to this, and have even done more. I would like to state my appreciation of the contribution these companies have made to the rehabilitation of returned men."

Professor Sexton brought to the attention of the Society the necessity of vocational training for the cripples of industry, and the opportunity afforded by the existing organization which was working so successfully in refitting crippled soldiers for branches of civilian endeavor varying from their occupations previous to enlistment.

The consensus of the meeting was that Professor Sexton had opened up an important question with far-reaching possibilities, but a question that was itself in the process of development through existing agencies.

Amendments to Compensation Act.

During the progress of the meeting the Committee on Legislation reported on amendments to the Workmen's Compensation Act, which are proposed to be enacted during the current session of the Nova Scotia House of Assembly, and reference had been made to a proposal to increase the scope of the Act to include compulsory medical aid in all cases of accident. This will, if enacted, increase the disbursements under the Act by possibly twenty per cent., and while the present proposals contemplate medical aid for 30 days following an accident only, the implications of medical aid must eventually go much further. It was also mentioned that arrangements had been made to commence a Safety Council, under the direction of the Workmen's Compensation Board, empowered to make certain regulations concerning the safety of workmen, which if approved by the Board, will become compulsory upon all members of any given industry within the scope of the Act.

As there now exists at the collieries and steel-works of the Province and in many other industries, systems by which medical aid and hospital treatment is secured not only for workmen in the case of accidents arising out of their employment, but for the workman and his family also in sickness as well as accident, it was felt that while the matter was complicated, yet the existing benefactions and movements indicated a possible method by which some form of training could be extended to the cripples of industry, as it is now extended to the cripples of war.

A Committee was appointed to study the question raised by Professor Sexton and to report thereon to the Council.

The Committee named was as follows: The President, Colonel Cantley; the past-President, Mr. D. H. McDougall; the Vice-President, Mr. A. J. Tonge, of the Dominion Coal Co.; Mr. F. E. Lucas, of the Dominion Steel Company, and Prof. Sexton.

Majority of Meeting Favor Change in Name.

An echo of the Canadian Mining Institute Meeting was heard in a motion approving the suggested change of the name of the Institute. After some discussion a resolution was passed recording that "a majority of the members of the Mining Society of Nova Scotia present at the Annual Meeting in April, 1919, were in favor of changing the name of the Canadian Mining Institute to "The Canadian Institute of Mining and Metallurgy to "The Canadian Institute of Mining and desire to bind the individual members of the Society in voting through the letter ballot proposed on this question, and that each member would use his own judgment in voting.

The opinion of the meeting was overwhelming in favor of the proposed change of name.

A resolution of condolence was passed on the death of Mr. J. D. Maxwell, late the Assistant General Superintendent of the Dominion Coal Company, who was for many years past an active member of the Society and a Member of Council.

The proceedings of the Annual Meeting came to a close with a smoking concert on Thursday evening, when some really excellent singing, and some pleasant nonsense, concluded an enjoyable meeting.

Suggestions for Mining Institute Meetings.

The opinion of one who has attended both the meetings of the C. M. I. and those of the M. S. of N. S. is that the Mining Society has not suffered in its individuality nor in its virility by its union with the Institute, and possibly some improvements might be suggested in the Institute's form of annual meeting gathered from watching the proceedings of the smaller Society. The papers presented at the Annual Meeting in New Glasgow were few in number, but designed to evoke thorough discussion. The reading of the papers was not interrupted by outside attractions, and as the meeting took place in an "upper hall" at the top of three flights of stairs, the discussion was not spoiled by intermittent wafts of the animated gabble taking place outside which has so often spoiled the delivery and reception of a paper read before the C. M. I. on which the author had probably spent months, if not years of study and preparation. The writer has always thought that if the papers read at the C. M. I. Annual Meetings were fewer in number and more adequately discussed, without the usual interruptions, the annual gathering would be more useful from the technical side, although possibly it might lack in social attractions. As to this, however, one cannot be quite sure, because it may be that more people attend the meetings to hear the papers than has been popularly supposed.

The writer feels disposed to make an even more radical suggestion, namely, that no papers should be asked for the Annual Meeting of the C. M. I., but that a number of papers, limited to perhaps six, should be selected from among the papers read at the meetings of the Branches, for presentation at the Annual Meeting, and for discussion. Written discussion should be particularly sought, and in order to make this possible to the widest extent, the papers selected should appear in the Bulletin a month or more before the date of the Annual Meeting at headquarters. — F. W. Gray.

Canada's War Record

By COL. THOS. CANTLEY.

On the occasion of our last meeting at Sydney, May first, 1919, Col. D. H. MacDougall, in his presidential address, directed your attention largely to the subject of coal—its importance in the prosecution of the struggle in which we in company with the other portion of the Empire were then engaged, and its influence upon the National life of Canada. In view of the fact that since that date the arms of the British Empire and our Allies have been crowned with victory—our foes having on the 11th November, last, cried, "enough", and accepted armistice conditions which in effect ended the war so far as they were concerned — I think it now fitting at this the first meeting of the Mining Society in a new era after four and three quarters years experience of war conditions, that your President with your permission, direct your attention to what Canada has done in the Great War, its cost to the Dominion in men and money, the effect produced on our people, the conditions arising out of the War, and how we may best meet these.

As to the Dominion's part in the Great Struggle, some idea as to the development, extent, and cost of our effort may be gathered from the following figures:

	Number of men sent overseas.	Expenditures.
1914	30,999	$ 25,275,749.
1915	84,334	127,616,300.
1916	165,555	248,665,770.
1917	65,536	515,094,895.
1918	73,630	360,000,000.
	418,052	$1,076,756,714.

From the figures just quoted it is shown that up to November 15th we had sent overseas 418,052 men. Of this total it is estimated that some 6,000 coal miners enlisted from Nova Scotia. Surely a very creditable record — and altho some may doubt the wisdom of the authorities in permitting so many skilled men to enlist, the spirit and patriotism of these volunteers is beyond question.

The losses in the Canadian Army for the same period amount to 218,433 and 52,176 were killed in action or died of wounds. Reviewing some of the more illuminating details it would appear that Canada's participation in the Great War up to November last had cost One Billion dollars. Of this amount more than half, or to be exact, $567,540,000 represents pay and allowances. For the maintenance of our Army in France we have paid out $114,367,000, Separation allowances called for $81,470,000 — the clothing for the Army has cost $57,000,000 — boots and repairs, $11,333,000. To transport our army across the seas we paid $17,815,000, and the land transport cost $19,112,000 — horses and remounts $6,594,000, machine guns, $4,494,000 — outfit allowances $11,622,000.

The average cost of rations per man in Canada was fifty cents and in Great Britain, .38½ cents per day. The average pay to our soldiers was about $1.25 per day for all ranks. The cost per man for clothing is about $64. per year, to which about $5.00 is added for necessaries. Upkeep has been placed at $20. per man per month. On the 31st October, 1918, there were 90,000 families of dependents of soldiers in Canada who received an average of $33. a month for all ranks—this by way of separation allowance. The maintenance of our men in France worked out at about $2.50 per day—this includes everything.

History has been enriched by the record of Canadian arms. How proudly we recall the immediate response to the Empire's call for men, when over 33,000 Canadians volunteered, went into training at Valcartier in August and on September 25th, 1914, embarked for overseas, arriving safely in England October 16th. In the early days of February 1915, they crossed to France, and soon took their place in the front lines as an integral part of the British forces. What a thrill of pride went thru all Canada a few months later at the wonderful stand of the Canadians at the Second Battle of Ypres, where the Hun first used gas, and when the Canadians held the broken line against overwhelming odds, and saved not only the Channel ports for England, but also saved the British Army from a military disaster. Month by month the Canadian army steadily grew in strength, always adding fresh lustre to its proud record. Langemarck, St. Julien, Courcelette, the Somme campaign, the storming of Vimy Ridge, Passchendale, the breaking of the Hindenberg Line, the capture of Cambrai, Amiens, and finally the dramatic entry into Mons at the closing moment of the war, all have added to Canada's fame, and it is our Army's proud boast that Canadians never failed to capture their objective.

Of their exploits and individual bravery much has been and more will be written. Their activities have extended from France and Flanders to the Archangel and Vladivostock fronts in Russia. Canadians participated in the Dardanelles campaign, others were in Mesopotamia, Medical units and our airmen assisted in Egypt, and wherever the need was geatest our men were found. For their gallantry already 55 Canadians have been awarded the Victory Cross, 513 the D. S. O., 1882 the Military Cross, 1,188 Distinguished Conduct Medals, and 4,697 received the Military Medal. Canadians were mentioned in despatches on 3,333 occasions, and won numerous foreign decorations. We can also point with pride to the fact that nearly if indeed not more than 200 Nursing Sisters were awarded the Royal Red Cross.

Canada in her participation in the great war literally found herself. Not only did we as citizens of this great Dominion rise to a higher conception of our individuality as a Nation, but demonstrated our place as one of the chief Dominions in the greater Empire that the world has ever known. We also won the unfeigned admiration not only of the world in arms, but also of the great brotherhood of world wide nations who with few exceptions were one in the conviction that the military conception and purpose of the Central Powers must be utterly destroyed. While it is true that our neighbors of the Republic to the south for several years did not join us in what for a considerable time seemed to them at least a doubtful conflict, the great majority of their better citizens secretly, and many of their most prominent men, openly, expressed their admiration for the instant action of Canada in springing to the defence not only of the Empire, but of civilization, and applauded the energy and determination with which so small a people ventured all for what they conceived to be the right.

As to the people of Canada, who can measure, who can determine or set bounds to the moral and national uplift which came to us thru the participation of their sons in this great conflict. More than 400,000 of the youth and vigor of Canada went from our shores, all of them having counted the cost, and most realizing that they would soon be engaged in a war waged by methods more destructive, more deadly beyond all parallel in past history, and opposed by a foe who resorted to methods not only deadly but detestable, and even diabolical beyond human experience. Despite all this they went forward with a smile and a joke, and today 60,000 of them lie in lonely graves not only in France and Flanders, but on the shores of the Dardanelles, in Egypt, Russia, and many in the old home land. Over 218,600 have been wounded, and more than 30,000 are still in hospitals in Great Britain, France or Canada, and when all will have been demobilized, Canada will have a number more or less maimed and permanently disabled exceeding that heroic vanguard of 30,000 who sailed from Valcartier, October 1914.

These men, our returned soldiers, who have participated in the struggle, who have seen all its horrors, the wastage of life, the wanton destruction of homes and property, and have borne uncomplainingly in some cases for years, conditions of existence, of which we at home have no conception, have given the best years of their lives that we Canadians might continue to enjoy what we so often glibly and without understanding its cost, refer to as "liberty". To these men and to those who have fallen, the Nation and particularly this Dominion, owes a debt of gratitude beyond computation. To those who still live, and for the parents and friends of our heroic dead, the greatest reward must be the consciousness of having done their part, and contributed their best to the winning of the freedom of the world. We who have not been combatants but remained quietly at home must remember that we owe much, and that obligation we must recognize and discharge as best we can, and in the spirit and so far as it is possible, in measure equal to the service and sacrifice which our returning men so spontaneously and so gloriously rendered on our behalf.

Conditions Arising Out of the War.

When an economic period, measured in this case by nearly five years, suddenly ends, and the world is brought face to face with wholly opposite conditions, a period of uncertainty and confusion is bound to follow. Many predictions are more or less fulfilled, but often in unexpected ways and with unexepected immediate consequences. Some things which we thought would certainly follow do not occur, or if they do, the result is often opposite to what was anticipated. The effect is bewildering and a comprehensive grasp of the situation is impossible. This conditions of affairs is not new, but has marked the immediate close of every great war. As by comparison the war which began in August 1914 was from every point of view the greatest that history has ever known, it is natural, on reflection, to suppose that the dislocation of commerce and trade, and the readjustment and return to normal conditions must present corresponding difficulties, and require a corresponding period in which to effect complete readjustment.

We are now emerging from the artificial conditions of war, during which trade and industry, politics and legislation, and the habits of our people have been more or less run in new and unfamiliar channels, and in most cases not to our liking. Our instincts are to get back as quickly as possible to former ways. In the doing of this, however, we encounter many obstacles. At first thought it would appear that the abnormal high war prices, which were the result of the war itself, and war time requirements (enhanced by lack of transport) would immediately disappear with the cessation of hostilities, that the disbanded armies would return to productive work, and that instead of a shortage of labor, the world's demands for curtailed supplies of manufactured goods of every description would provide occupation for all our workers, but the fact is that to quickly adapt industrial plans and activity to after-the-war altered conditions is difficult and complex.

High prices have stimulated certain manufacturers and made possible the marketing of certain raw materials at points and under conditions which can no longer be carried on at a profit. War time prices were not merely a cause, but in many cases, the effect of was time advanced wages — but wages do not come down relatively to the decline of prices. Prospective buyers are waiting and will continue to wait until convinced that automatic readjustment has carried prices to the lowest or nearly the lowest point. The question of wages, therefore, is not merely an industrial but also a social problem.

Such transition period past history has shown to be always a trying one, and our experience will be no departure from that of the past. It is no exaggeration, to say that the result, or up to the present, the lack of result, of the deliberations of the Peace Conference has been a great disappointment everywhere, and in provoking feelings of resentment which are not confined to the manufacturing or working classes, to the shipping or the agricultural community, but is wide spread throughout the world, and that for good reasons. The general view of the duties of the Peace Conference was that at the earliest possible moment, and with the least delay, and ignoring all extraneous questions, they would determine the terms of peace with Germany, and Germany's allies, such terms to include the amount to be paid by them towards the loss and cost of the war to the Allies, together with the territorial rearrangement due to the altered conditions resulting from the war, and the enforcement of adequate physical restrictions upon Germany, which would prevent that country reaching a

position where it could be a menace to the peace of Europe within the life of the next generation.

Unfortunately there is too much reason for concluding that other considerations than these have more or less governed the deliberations and protracted the work of the Peace Conference. The time has been wasted in the discussion of academic theories and illusionary suggestions by which it is asserted continuous world peace might be secured. Ideas put forward by visionaries who have forgotten, if indeed they ever realized, that man has, as all recorded history proves, always been a pugnacious animal, with a latent unrest, looking forward to and reaching out for a better and more satisfactory adjustment of physical needs and physical possessions. While it might be going too far to say that all human material progress has been the outcome of war, it can at least be safely asserted that much af the material advantage and comforts arising out and enjoyed by civilization has been the result of past wars.

The world as a whole at present has had its full of fighting, is sated with slaughter. A large part of the civilized world today is in mourning — all the warring nations are more or less exhausted physically and economically, and are disposed to cry out "enough". But given twenty or thirty years of peace, with war debts paid, the British Empire, France and Germany again prosperous, Russia returned to civilization, Japan enormously grown in power and wealth, China and the East having found themselves, with a new generation of men governing the world who will know the horror of war only through history and tradition — men of like passions, like hopes, like aspirations, and like desires as ourselves, what League of Nations will prevent, and how far, think you, will decisions arising out of the generalities and resolutions of a war-weary world then restrain or control any of the world powers of that time, who for causes then pressing on them, determine to emancipate themselves from conditions which they consider intolerable? Or who on the other hand, as did Germany in 1914, may decide to extend their influence and better their position by an appeal to arms. Abstract theories, be they ever so virtous, have not sufficed in the past to keep of the world, and will not in the future. Reliance on, not scraps of paper, but on adequate military training and ability to defend ourselves, is the only proven safeguard against loss of liberty.

Practically the condition today before us as Canadians is as to how we can the earliest, the most certainly, and with the least cost, return to normal economic conditions, pay our vast accumulation of war debt, and bring plenty and contentment to the people of this Dominion by providing employment for all our workers be engaged in mining, agriculture, fishing, manufacturing, or commerce. There is a disposition on the part of many to think that all this can be accomplished by Governmental authority — these men forgetting entirely the functions of Government.

In our judgment the first thing necessary is the removal of all Governmental control arising out of the war, or imposed on us on the pleas that such was necessary for the proper prosecution of the War. Included in this is the release of all requisitioned shipping, the readjustment of taxation, on such a basis as will provide the amount necessary for the carrying on of the Government, meet the interest, and provide a sinking fund which will retire our War Debt not within ten or fifteen years, but say forty or fifty years hence.

Much has been heard and more written on the subject of Reconstruction, both at home and abroad. Social reformers have vast schemes of re-employment, better housing, the so-called Whitley and other schemes for labor co-operation in marketing and distribution of commodities, nationalization of transportation, of mines, and of other sources of raw material. These in the main are discussed and advocated by people in academic life or habit of thought, men devoid of all practical experience in business or commercial life, but whose self-conceit is thereby none the less diminished, but who on the other hand, are quite convinced that they are competent to advise and direct the commerce of the country at the most difficult crisis in history.

In some circles great hopes are held out as to extensive markets being found for our manufactured goods in the devastated regions of France and Belgium. The active head of the American Red Cross Construction work in France is reported as stated that that country would require 80,000 ploughs, 56,000 cultivators, 39,000 mowing machines, 115,000 farm waggons, 88,000 harrows, 50,000 rollers, 36,000 seed drills, 13,000 fertilizers, 16,000 horse drawn rakes, 32,000 reapers and binders, and various other farm implements. We have no means of knowing as to the correctness of these figures, the sources of information available to or capacity of those who give them. Neither have we any information as to whether all this agricultural machinery is required during the present year or over a period of years.

Other estimates have been made and published as to the enormous amount of reconstruction material required for the rebuilding of devastated areas in France and Flanders. People not lacking in imagination, but possessing that characteristic in a greater degree than knowledge or judgment, have assumed that these two countries will buy from Canada and America during the coming year, more manufactured goods than we are probably prepared to supply, or at any rate than we can find transport for. Now France and Belgium will both require considerable quantity of sawn lumber, also certain raw materials such as cotton, coal, leather, pig iron in limited quantities, and some steel. Of course considerable quantities of food, cheap clothing, and a very common type of furniture in a knock-down condition, will also be wanted. Beyond these the requirements of France and Belgium are few, which need not be surprising when it is realized that these countries have their own problems of providing employment for their demobilized armies, coupled with the fact that that they have not the money, nor can they easily obtain the credit, if they wished it, for large importations. Their expressed intention is to provide employment for their own people, first, by manufacturing their own requirements and, second, so far as possible, by supplying the world's market with such products and goods as their resources will permit them to supply. Further, the ruined cities and towns of devastated France will not all be rebuilt either during this year, or even within the next five years.

It is a self-evident fact that if Canada is to pay the interest on her debts, raise the amount necessary for pensions and so keep faith with her illustrious dead, and returned broken men, and also maintain the ordinary public service of the country, the Government must be provided with an amount of money practically three times that contributed by Canada in pre-war days. This can only be done by a large export of agricul-

tural and manufactured products, and while we must look to Europe to absorb our agricultural products, it is not in that direction we should look for a market for the great bulk of our manufactured goods, but rather to our sister Dominions, the islands of the West Indies, and the Republics of South America, to supply which the transport charges should not be greater from Canada than from Europe, and where we can meet the manufacturers of Europe on practically equal terms. This can only be done by complete freedom from Governmental control of business, and from subserviency to class interests, whether it be that of labor, agricultural, or capital. The financial policy of Canada must be such as will raise sufficient revenue without an abnormal tax on invested capital, without which industry is impotent.

Economic laws will soon automatically lower prices of both food and commodities, and with a lower cost of these must come a lowering of the wage scale, which all Governments so generously advanced during the war times now past.

The solution of the labor troubles will perhaps best be met by the recognition by both capital and labor that a spirit of reasonable accommodation must prevail — that leadership must be recognized, and that conspicuous ability, be it among manufacturing managers or industrial workers, must be rewarded on a different scale from that of mediocracy. A broad minded policy on both sides which will learn to be fair and firm in essentials and also complacent and generous as regards non-essentials. These we suggest as some of the requisites for a return of properity to Canada, which we fully believe will soon enter upon a period of development and expansion greater than anything we have yet seen — great as that has been — for though much has been accomplished the greatness of the Dominion is still practically potential, and Canada is still of all countries par excellence the Land of Opportunity.

BELMONT SURF INLET MINES, LIMITED.

A report covering the ten months ending 31st December, 1919, has just been issued by the Belmont Surf Inlet Co., Ltd., operating mines at Surf Inlet, B.C. The net earnings of the company amounted to $323,242. The report also states that a loan made to the Company by the Tonapah Belmont Development Company amounting to $1,295,726, and interest has been repaid.

The average metal content of 83,142 dry tons of ore milled was 0.421 oz. in gold, 0,3114 oz. in silver and 0.2606% copper per ton, giving a total value of $924,847 or $11.12 per ton. The ratio of concentration is 11.09 to 1, which gives 7498 dry tons of concentrates having a gross value of $854,537.20 or an average value of $113.97 per ton.

Gold, silver and copper were sold at an average of $19.74 per oz., 97.13 cents per oz. and 20.957 cents per lb., respectively. Operating costs amounted to $7.185 per ton, the net realization being $3.888 per ton or 35.1% of the gross value of the ore. Mill tailing losses were .846 per ton.

Mining costs, which are especially interesting at the present time, show stoping to have cost $2.22 per ton, development work $0.361, milling $1.278, flotation royalties $0.116 and administration and taxes $0.614 per ton. The total operating costs being $4.83 per ton. Loss on boarding and bunk houses $0.182 per ton. The costs of drifting 893 feet, cross-cutting 241 feet, and upraising 753 feet were $16.41; $16.26 and $13.215 per foot respectively. The average cost of the 1887 lineal feet of all development work was $15,116 per foot. Each foot driven yielded 4.18 tons.

Operating costs were seriously affected by advanced prices paid for supplies and by the abnormally high labor costs. High wages, however, did not improve the low efficiency of the labor.

Ore reserves are calculated to be 422,761 tons or an increase of 153,790 tons since March, 1917.

New ore development was satisfactory although development work was less than the advisable minimum owing to labor shortage.

Milling operations fully met expectations for both efficiency and economy, 93.7% of the possible operating time, namely 13,818 hours the concentrator ran continuously, milling 272.6 tons per day, although over 300 tons per day have been milled since the end of the year.

Concentrates amounting to 6,374 dry tons were shipped to the smelter yielding $780,775.02 and 1123 tons of concentrates valued at $73,762.18 remained unshipped owing to a difficulty in securing steamers.

The hydro-electric plant gave excellent results, 4,737,360 kilowatt hours being generated with 4,394,525 k.w.h. delivered or a loss of only 7.37% in lines and transformers. The cost of producing the power was $9,966.78 or $1.23 per horse-power month.

Construction of houses for employees, a store and school-house was undertaken at a cost of $45,569.77.

A dividend of 5% or 5c per share was paid on 15th April, 1919.

PORTLAND CANAL ATTRACTS ATTENTION.

Attention continues to be commanded by Portland Canal, B.C. The Premier Mine, Salmon River, shipped 204¾ tons to the Tacoma Smelter, and the gross value returns were $67,483.55. The Premier formerly was known as the Bush Mine, and is owned by R. K. Neill, of Spokane, and Messrs. Woods and Trites, of Fernie, B.C. Several important mining deals have taken place recently in which Portland Canal properties were the issue. New York men, for instance, are said to have acquired a considerable interest in the Premier or Bush mine. The Forty-Nine and Yellowstone Groups have been bonded to C. F. Caldwell for $125,000. The Silver King Group, adjoining the Joker, has been bonded by O. B. Bush, of Vancouver, for $100,000. Mining properties now working in the Salmon River section are the Premier, Mineral Hill, and Joker. Work will commence about July 1 on the Big Missouri, recently bonded to Sir Donald Mann, the Yellowstone, Bush Mines, Forty Nine and Silver Creek. With a considerable number of prospectors going into the country this summer, and with operations under way on the properties enumerated, not to overlook the road and wharf construction which the Government plans, the Salmon River district should be the scene of much industry during the next few months. Mr. Caldwell, who speaks with unbounded enthusiasm, of the possibilities of the new camp, expresses the hope that the Government will appreciate the need of a railroad to open it and to aid in the development of its mineral.

Tunnelling on the Western Front

By LT. GEO. H. MORLEY, M.C.

The object of this paper is to give a general idea of the work of Tunnelling Companies in the last war.

Tunnelling was first recognized by the British as an important arm of the service in the middle and latter part of 1915, when a call was sent to all units for men and officers with mining experience in civil life to volunteer to serve in this new kind of warfare.

Large number of miners from all parts of the world —Cape Breton being well represented—came forward, and what was known as the Brigade Mining Sections were formed and the work of stopping the Boche underground was started.

These units were not properly organized and were not given the support necessary to compete with an organized, fully equipped and prepared enemy; consequently the Boche held absolute control of the mining situation up to the beginning of 1916.

It was then that the Tunnelling Companies were formed, organized and fully equipped in every detail. These Companies started with an establishment of some five hundred officers and men, had their own transport, blacksmith, carpenter and repair shop; in fact, were complete in themselves.

This establishment was sufficient at the start, but as the work undertaken grew, and the underground systems became extensive, it was found necessary to add to the strength from time to time, and toward the end most Companies had a total of anywhere from ten to twelve hundred all ranks.

The work, in the beginning, was started from the makeshift systems of Brigade Mining Sections. These systems served the purpose of keeping the Hun checked, to a certain extent, until such time as the new companies were able to sink large new shafts, at greater depths than had been previously attempted, and push forward new systems with a definite plan of action. These systems consisted of: 1st, Shafts sunk at depths of anywhere from 16 to 120 feet at varying distances along either the front or support line trenches. 2nd, From the shafts a large gallery, generally 5ft. by 3ft. was driven out towards the German front line for a short distance, as a rule 10 or 20 feet in front of our lines. From these large galleries, smaller ones, 4ft. 3in. by 2ft. 3in. were broken off to the right and left and driven to parallel our trenches.

The parallel galleries were for defensive purposes only and were generally connected up with the galleries of the shafts on both flanks, forming a complete barrier against any enemy offensive mining and at the same time affording several exits for the men below in case of any shaft being wrecked by the enemy artillery.

At intervals of roughly sixty feet listening posts were driven from the parallel galleries towards the German lines. The listening posts were "Feelers" pushed out until they came in contact with the Hun. In these posts men trained in listening underground listened for sounds of enemy mining. If sounds were heard it was from these posts that the task of stopping his work and pushing him back was undertaken. It was in this line of work that the British miner proved his superiority. In the first place we must remember that the German not only had his systems well across No Man's Land when we started, but in many places had his offensive galleries well under our trenches, waiting the opportune moment to blow and start his big push forward.

The Reason for Deep Shafts.

Our problem was: How can we pass his systems, and get ours well out without fighting every inch of the way with great loss of life and material.

The obvious thing to do was go deeper. Up to this point all operations were carried on near the surface, the greatest depths being roughly twenty feet. The difficulty of going below that was due to a layer of quicksand varying from fifteen to thirty feet. Both sides found it impossible to sink a shaft through this sand with the material and plant supplied.

We tried piling through time and again and managed at some points to get down to the firm blue clay; but so much water came down continually that all our time and attention was taken up with the problem of keeping the water in check and very little work was accomplished.

Water Tight Steel Shafts.

Next we tried to jack down a water tight shaft through the quicksand into the blue clay, taking the muck out of the shaft after it was down in position and set. This proved to be very satisfactory and it was on this principle that all shafts either timber or steel were sunk afterwards and we were able to mine at any depth we wished.

Driving Under Hun Galleries.

Galleries were pushed ahead generally at two depths. Sometimes as many as three levels were driven from the one shaft, the two upper being defensive saps, the lower an offensive.

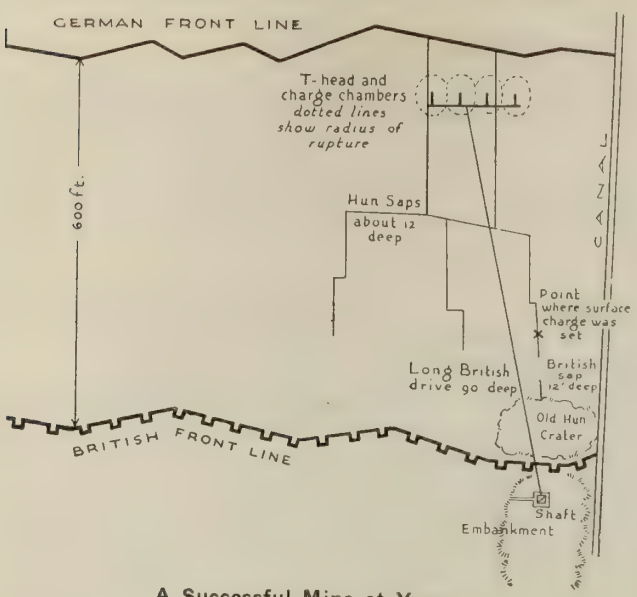
In this manner we drove under the Hun galleries, far enough below to work without being heard by his listeners, rising as we advanced, and in time our sapheads were driven close to his front line. With the use of the geophone—a very sensitive listening apparatus, on the principle of the stethoscope by very careful listening our listeners were able to locate the position of the enemy saps. We then carefully and quietly drove a post towards where we judged these enemy saps to be, made sure of the distance above and the exact location of his sap and placed a charge sufficient to wreck his gallery at that point, thereby cutting him off from the forward and main part of his system. If it was thought advisable we would drive into that forward part of his system, occupy it and work it as part of our defensive scheme.

A Successful Coup.

Below is a rough sketch of one highly successful coup planned and carried out by the 1st Canadian Tunnelling Company.

When the First Tunnelling Company started operations on this front (The Bluff, South-East of Ypres), the Hun had eight months start, sufficient time to mine our front line and have a complete defensive system prepared.

Shortly after we started operations; we found he was consolidated in every sense of the word. As the



A Successful Mine at Ypres.

plan shows. We found this by running a shallow sap from the outer rim of one of his old mine craters towards his line.

After we had driven a short distance the Hun blew; wrecking most of the gallery and killing the crew working at the time. We then realized that we were up against a proposition that required the greatest care and skill to accomplish the task set us.

We then drove ahead cautiously and slowly until we got to a point where we considered it wise to stop for the time being. Meanwhile we had sunk a shaft well to the rear of the front line and drove a sap, ninety feet below surface, towards the Hun. At the same time we carried out an extensive listening programme on the surface at night in No Man's Land and located the Hun system to be between 10 and 15 feet. We then placed a small charge of 25 pounds of ammonal on the surface in No Man's Land, directly over the point where we thought his gallery passed, and exploded it. This sprung a hole in which we placed a charge of 100 pounds that in turn was exploded at night, crushing his gallery below.

We immediately drove ahead from our shallow working and captured some thirty feet of Hun sap which we converted into a defensive gallery and held the German in that position. By this time our deep gallery had been driven quite close to the Hun front line, directly under the point we judged his main gallery passed. We then T-ed off, or drove a post to the right and one to the left, the total length of the two being roughly 160 feet. Four chambers were put in at fifty feet intervals and charges of 600 to 800 pounds of ammonal were placed in each chamber and exploded, cutting any galleries that passed across the T-head.

From the captured portion of the Hun sap we drove ahead as fast as possible and in a little under four hours we broke through into the Hun System and captured the whole thing complete with tools, listening devices and dead sappers.

We gained a great deal of information about Hun methods and appliances and found that all were inferior to ours at that stage of the game.

I might add that this put an absolute stop to Hun mining on this front and that great credit is due to Major North, O. C. of the Company, and Captain Roy Spencer, officer in charge of the work. Both are Nova Scotians as were most of the men who played their part so bravely and devotedly in that "Little Show."

Men Liked Work in "Offensive" Galleries.

Defensive mining was only one of the many lines of work which the Tunnelling Companies had to undertake.

The one ambition of every Tunnelling Company was to drive an offensive gallery, and if authority was granted to a Company to drive one, it was the one ambition of every sapper in that Company to work on it, and the sappers that were chosen to work there would show the same interest in it that a mother does for a sick child.

When those men came off duty the one topic of conversation would be "The big job," guesses would be made and bets laid as to the number of feet the following day's progress sheet would show, the date of completion, the number of tons to be placed in the charge, and what a poor unfortunate, miserable wretch the Hun was; and what a cute little prize packet they would hand him on "Der Tag"—Ourtag!

Such a thing as failure was unheard of. They did not know, and refused to recognize the word. Hadn't everything they'd undertaken proved successful? Had the Hun beaten them anywhere? The Hun had the wrong idea, the wrong spirit, the wrong breed of men to beat them.

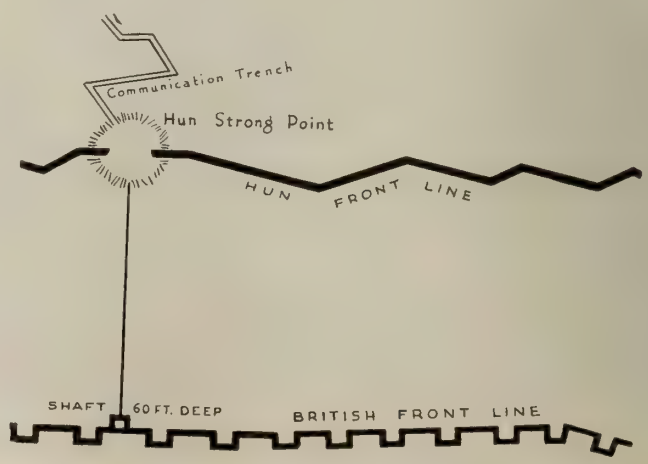
Confident, they were over confident possibly, but this was the spirit that overcame innumerable difficulties, that drove the Hun out of No Man's Land underground, made that part of No Man's Land British. The same spirit eventually drove the Germans to the German side of the Rhine.

As a rule defensive saps were driven at the same time as the offensive, and at times what was intended for an offensive sap had to be turned into a defensive or righting sap, due principally to running into a Hun defensive or offensive system.

There was one good example of this on the St. Eloi front.

A Problem on the St. Eloi Front.

An old R. E. timber shaft was used, as this was to be a surprise blow and time was a big factor. The shaft was sixty feet deep, deep enough to serve our purpose, but there was one drawback, and that was water. Water poured in continually from an old caved-in-system that had been driven from the shaft on a thirty-five foot level.



The distance from the shaft to our objective, a decidedly strong point at the head of a communication trench, was two hundred and thirty feet. We managed to drive 200 feet when the Hun became suspicious and started to bore large holes from his front line to a depth of anywhere from 30 to 50 feet. He placed heavy charges in these holes and exploded them, hoping by this searching method to blow one over or close enough to our gallery to wreck it. He blew three times.

Explosion Causes Flooding.

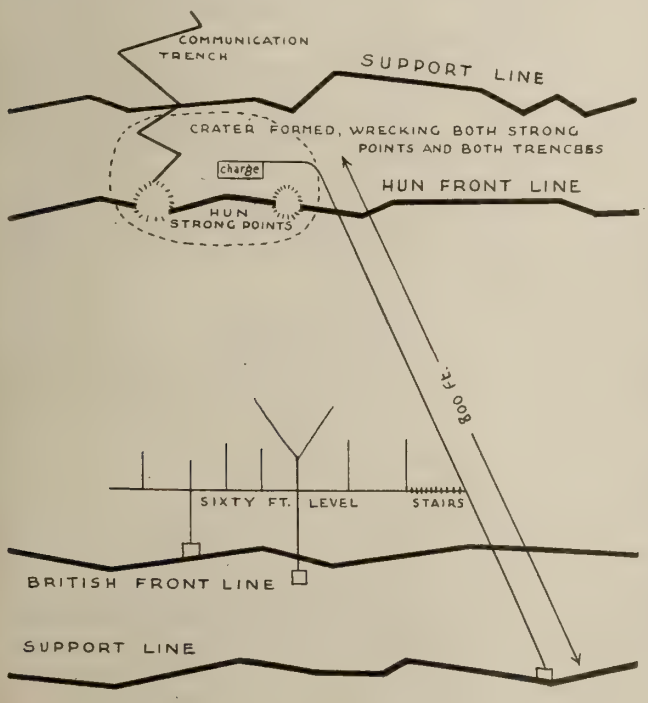
The first time he blew he crushed several timbers and pinned the two men at the face. The next blow was distant and did no damage. The third was a long way down his trench and under ordinary circumstances would have been perfectly harmless, but an extraordinary thing happened, the blow let in a small body of water through the old system on the high level, necessitating the withdrawing of the men and the lowering of two extra pumps.

All hands came on top and the first pump was lowered to the pump landing and a man just started down the ladder to set it up, when a deep roar was heard, and in less than two minutes the whole gallery and half the shaft was filled with water. This water came in from the old workings on the high level, it had evidently been dammed by a small cave-in and the jar of the third blow loosened the dam, let in the first bit of water which paved the way for the second and large body.

By the time we had pumped the water out of the sap and restarted work the Hun was prepared for us and we had to give up the idea of an offensive show from that sap, and it was converted into what became in time to a very elaborate defensive system and the scene of continuous underground fighting.

The Long Gallery to Destroy Two Strong Points.

It was then decided to sink a large new shaft at a greater depth back in the support line. There was several reasons for sinking it so far to the rear, the principal one's was that the spoil could be disposed of more easily, and there was less chance of being observed, also we were not bothered by the infantry to such a great extent as in the front line and fewer people would see the work being carried on. This last was most important, as the work had to be carried on with the greatest secrecy, and the fewer that had any knowledge of the work the greater the chance of success.



This shaft was sunk to a depth of 101 feet in a little less than fifteen days.

The dimensions was six feet long by four feet wide, timbered skin tight. 9in. by 3in. timber was used.

At a depth of 35 feet a large elaborate dug-out system was driven.

This system had accommodation and bunking for one hundred men. Was electrically lighted by a small gas driven engine and dynamo. Was well ventilated and drained. Five sets of stairways were driven to the surface which allowed a sufficient number of exits for the men in case of an attack.

The main offensive gallery was driven towards the Hun front line a distance of 800 feet, at 300 feet a stairway and gallery was broken away to the left to connect with the large defensive system on a sixty foot level.

50 Tons Ammonal in the Charge.

After many weary months of hard, delicate, monotonous work, under the worst of conditions, the sap was pushed behind the German front line, swung to the left and one of the largest charges ever laid in underground warfare (a matter of 50 tons of ammonal) was placed between the two Hun strong points. These strong points are famous in Canadian War Records. They are better known as the St. Eloi Craters Nos. 2 and 3.

19 Mines in Messines Ridge Blow.

This mine was exploded at the beginning of the Battle of Messines Ridge. In this show 19 mines with charges ranging from thirty to fifty tons, at depths of 60 to 130 feet, were exploded simultaneously, the greatest show of its kind in history. The mines were laid out at intervals under strong points on a twelve mile front—from Hill 60 to Plug Street.

Object of the Tunnelling.

The object was not so much to kill Boche as to reduce these trench forts, demoralize the enemy and save British lives; and in every case the mines more than served their purpose.

Ordinarily a whole Company would be sacrificed in taking any one of these points and much valuable time lost, whereas in this show the attacking troops advanced over and beyond the Hun first, second and third line of defences with practically no opposition and no casualties, in fact, on part of the front they advanced to a depth of 3 miles without any greater loss of men than would have been experienced in the ordinary routine of trench warfare on a day that the Official Reports would show "Everything quiet on the Western Front."

From a spectacular point of view it was thrilling, wonderful and inspiring, it was not a sight that a man could see without being impressed, without feeling that even though it was glorious it was awful—awful to think that there were hundreds of men in that inferno you'd helped let loose. There never was nor never will be anything like it. As one of the boys from Caledonia remarked to his butty, "There's gotta be a mighty big change in the fire works at the Halifax Exhibition before they'll get a half dollar out of me again."

The Effect on the Enemy.

What the Hun's impression was I can only guess, as a matter of fact I don't believe there was any lasting impression because the majority of those that survived were dazed, their day of usefulness as fighters was a thing of the past. Some gathered sufficient energy to run, but the greater number seemed to have lost all interest in living and what was taking place, and what proved to be the greatest advance in one day, up to that date, on the most strongly held and fortified front, with a minimum of casualties, was accomplished due to the way being cleared by the mines and perfect artillery co-operation.

Miners Were Needed at the Front.

As sorely as miners were needed on the home fronts, that is, men as producers, the need in France in the early stages of the war was much greater. It was a work that called for miners and the best type of miners; men who would stand any hardship, go through any danger for the cause; men of skill and initiative.

Nova Scotia Miners Did Well.

It would be superfluous for me to say that those Nova Scotian miners who answered the call came up to that standard. Their record speaks for itself. No task was too great for them. All difficulties encountered were overcome. They handled the defense of a trench or went into the attack with the same spirit and high standard of efficiency as they handled the work underground.

A Miner's Show.

A story of one of their shows might well be told. Following the Messines show on the night of July 31st, an attack on a ten mile front was started to the north of Messines. This was really the beginning of what was afterwards called the Paschendale Push. A party of tunnellers was sent with the attacking troops, which were English, for the purpose of examining cross-roads, dugouts, and material dumps, for booby traps or land mines. Very often the Hun on evacuating a position would leave a concealed charge there. This charge would be exploded by a trip wire, an acid time fuse, or by any one of his hundred and one different contrivances. Before a dugout could be entered or used by the infantry it had first to be reported safe by the tunnellers.

The first wave of the attacking troops had pushed forward, leaving a regular village of concrete dugouts to be cleaned up by our boys, and when they went to enter they found the Hun still active, shooting the troops that had gone ahead, in the back, and firing on the second wave as they were coming up. The tunnelling officer, Mr. Murray from Springhill, got one of the English infantry officers to go to one of the large dugouts with him and ordered the Huns to surrender. For answer, the English officer was bayoneted in the throat. The party immediately withdrew to a shell-hole and started rifle fire, when Dan Lynk, of Glace Bay, thought of a scheme, which was carried out. His plan was for the party to split, one-half to keep sniping, the other to creep up on the blind side of the dugout, get on top, and from that elevated and comparatively safe position toss bombs down through the doorway.

Dan Lynk as Santa Claus.

Lynk got up without mishap and the others passed bombs up to him. Just before he started he noticed the Huns had put a 4-inch square vertical ventilator up through the centre of the roof. "Here," he thought, "is where I play Santa Claus," and dropped his little prize packets through the "chimney." Immediately the first exploded, the Huns made a frantic rush for the door to "Kamarad," and were met by the rifle fire of the party left in the shellhole, so rushed back just as frantically and another bomb exploded. This game of Puss in the Corner kept up until our fellows figured that Fritz was weary of it, so walked up and made prisoners of those that lived.

Dinnie Cameron is Decorated.

Dinnie Cameron, of the Dominion, was sent in to examine the place. Inside he found a door leading into a long underground passage, which in turn lead into a large comfortable room, where, much to Dinnie's surprise, a dapper little German officer was enjoying his beauty sleep. Dinnie gently woke him by jerking him out of bed by the hair. The German sprang to his feet in a great fright and Kamaraded. Dinnie observed that the Hun wore the iron cross, and instructed the Bosche to transfer the decoration to his tunic. Dinnie now has the distinction of being about the only Canadian decorated with the iron cross. True, it was not placed there by the Kaiser, but by his representative in the field—a commissioned officer.

The Miner's Working Day at the Front.

In civil life miners and standard houses go together. When a new mine is started one of the first things considered is the laying out of the town site and the immediate erection of comfortable dwellings. We all know that men cannot work underground all day with the best results and sleep in the bush, in a hut or a shack. He needs comfortable quarters. Likewise the army miner. He needs and deserves the best that can be given. He works harder and longer hours than his civilian brother, and under the very worst of conditions. I'll describe a few of those conditions.

The day was divided into four shifts of six hour periods. The men of No. 1 shift would breakfast at 5 a.m., go on duty at 5 and work until 12 noon, being relieved by No. 2 shift which worked until 6 p.m. On being relieved No. 1 gets dinner, a rum tot, and immediately goes to bed and sleeps till 5 p.m., when supper is given out. They go on duty again at 6 p.m., work till 12 midnight, and are again relieved by No. 2 shift. They have another meal and sleep until 5 a.m.—another day started. Thus they worked twelve hours a day, with about nine hours sleep, with no recreation or time for amusement of any sort unless at the expense of sleeping time. All this is in the front line trenches, and those men are below ground where if a raid was put over by the Bosche they would be entombed or trapped. Add to this the constant "strafe" of the so-called "quiet" day, and you have a picture of the tunneller's life during his "trip up"—he worked six days in the line and four days out, back at the company headquarters.

Underground, fortunately, we had no inspector of mines. If we had, the mines would surely have been idle. As I stated before, the galleries were only two feet three inches wide and four feet three high, close timbered; a small track was laid, over this ran a rubber-tired truck used to take the clay out from the face.

The galleries were of different lengths, some ran to 1,200 feet. The ventilation was of the worst imaginable. The air was forced down a three-inch rubber hose by a small hand worked pump to the face. At a few points only was there sufficient oxygen in the air to light a match or keep a candle burning. The saps were generally damp and smelly. Work had to be carried on at high speed, but silently. The men moved

about with their feet thickly padded with sand bags to muffle the sound of the tread; they sometimes went so far as to go barefooted. The man at the face, the post of honor, worked bare-buff, his clothing consisting of a pair of boots and a pair of pants.

Standard Dugouts Were a Success.

In the very early stages of the game both men and officers realized that comparatively safe and comfortable quarters were necessary; that a dry spot on the parapet, or a ramshackle dugout was not good enough for these men, so decided to "build" good, dry, safe dugouts. These were not successful, for numerous reasons. Then one of the officers thought it would be a good plan to "dig" our future homes—to make standard dugouts in conjunction with our mining scheme; to make the dugouts part of the scheme. This was tried and found to be highly successful. As time went on, our standard dugout, a wooden affair, seven feet high, seven wide, and generally thirty feet long, with an eight inch borehole to the surface for ventilation, was improved upon, and towards the last stages of the game the dugouts were all steel and finished, were seven feet high and nine feet wide, and ran sometimes to a hundred feet in length. The top and mud sills and side pieces were 5″ x 3″ I beams placed at 18 inch centres, with a sheet of corrugated iron above and between the I beams to keep the soil from falling through. The dugouts were finished with soft wood sheathing, pointed white, and bunks installed. There would never be less than five exits to a system, and in some of the large ones there were as many as twenty.

Generally a small gasoline motor and dynamo would be installed for lighting purposes. This was a necessity as well as a luxury, as lights were needed through the saps and candles would not burn, and the life of a portable electric mine lamp was too short.

Miners' Dugouts Appreciated by Infantry.

We were very comfortable and safe in our underground homes until one day an Imperial staff officer thought he'd like to take a look at a sap and see the dirty miners at work. At the beginning he was rather nervous, and kept us amused with his "I say, is there any chance of the roof dropping in"; "Is the water deep down there"; "I suppose these clothes will never be fit to wear again"; "My word, we must be deep"; "is that an electric light"; "I say this is most extraordinary"; and so on. He was most surprised to find clean, airy, dry dugouts below. "Didn't think such a thing possible in such soil." The outcome of that visit was an order to start building deep dugouts for the infantry, and some of our places were pinched for battalion headquarters, Y.M.C.A.'s, and such like. We weren't at all pleased at the way things turned out, and came to the conclusion that the best way to keep them out of our places was to build some for them. This was carried out, and in very short time dugout work was a very important part of the programme of every tunnelling company, and some very large systems were built. Some of these large ones had accommodation for a brigade of men.

These places were invaluable as concentration points before a push. Large numbers of men could be brought up at night and put in these dugouts and wait there for the show to start. They would be safe from shell fire and, what was more important, they were free from observation.

Underground Hospitals.

Large hospitals were built underground, almost in the front line. A man could get attention almost immediately he was hit. In this work, as in the other branches, the Canadian miner "showed the way." Their style of dugout was adopted by the army and made standard; their methods of handling the soil and construction were taught in the army mining schools, and when an important rush job was to be done the Canadian was sent to do it, and never was the trust misplaced.

The Canadian miner's record in this war is unexcelled, and is one of which he, and all Canada, may be very proud.

MAY OPERATE GREENWOOD SMELTER.

It is possible that the Greenwood Smelter recently closed down by the Canada Copper Corporation, which has moved to Copper Mountain, will be re-opened as the company has offered the plant and contiguous properties to the citizens of Greenwood for the sum of $125,000. As the continued existence of the town depends on the maintenance of an active mining industry, and as the company's proposition is considered very reasonable, it is very probable that it will be accepted and arrangements made for the revival of the new dormant mines and plant. At Boundary Falls is situated the New Dominion Smelter which has been idle for some years. This also has been proferred to Greenwood's business men, together with its mines, on favorable terms. Two or three alternative propositions have been advanced in connection with the latter and it is thought likely that one will be accepted. Hugh R. Van Wagenen, manager of the Canada Copper Company, states that while the basis fixed for the transfer of these holdings is low it has its advantage for the company if it can be financed by the Greenwood people. It would cost probably $400,000 to $500,000 to instal such a plant to-day even if delivery could be obtained, but it is costing the company for watchmen, taxes, insurance and other expenses around $500 or $600 a month to retain the property. By wrecking the plant probably $125,000 could be realized, but the company would prefer to see Greenwood live. The Greenwood committee assert that the Greenwood business is worth half a million dollars as a going concern and they propose, with the aid of outside capital, to keep the furnaces going. The mines included in the Greenwood deal are the Mother Lode Group, B. C. Mine, Oro Denora, Mountain Rose, Lone Star, and several others. Some of the equipment has been removed from the Mother Lode, but there is still one compressor, the hoist and the crusher. The equipment is sufficient to handle a couple of hundred tons a day, probably all the profitable ore that could be extracted from the mine in its present state of development. The smelter, however, is intact and ready to be blown in at any time. Mr. Oscar Lachmund, metallurgical engineer, who has been retained by the Greenwood Committee in an advisory capacity, is satisfied that there are ore supplies within shipping distance of the smelter to keep it running for years and it is believed that the cost of treatment with Mother Lode, Brooklyn or other fluxing ores will always keep the cost of copper production at a low point.

The Salt Industry and the Possibilities for the Future Development in Canada

By L. HEBER COLE,
Mines Branch, Dept. of Mines, Ottawa.

(By permission of the Director, Mines Branch.)
Paper presented at the Meetings of The Mining Society of Nova Scotia, New Glasgow, N. S., April 23-24, 1919.

INTRODUCTORY.

1. **The Technology of the Salt Industry.**
   - Introduction.
   - Classification.
     - a. Rock Salt.
       1. The Mining and Milling of Rock Salt.
       2. Artificial Brines from Rock Salt.
     - b. Salt from Natural Springs, the Sea, Salt Lakes and Artificial Brines.
       1. Solar Evaporation.
       2. Direct Fire Evaporation.
          - Kettle Process.
          - Pan Process.
       3. Steam Evaporation.
          - Kettle with Steam Jacket.
          - Grainer Process.
          - Vacuum Pan Evaporation.
   - Preparation of Salt from Evaporation, for the Market.
   - By-products from the industry.
2. **Uses of Salt.**
   - a. Domestic.
   - b. Fish and Meat Curing.
   - c. Metallurgical Industries.
   - d. Associated Chemical Industries.
   - e. Incidental Uses of Salt.
3. **The Salt Deposits of Canada.**
   - Introduction.
   - a. British Columbia.
   - b. Alberta, Sask., and North West Territories.
   - c. Manitoba.
   - d. Ontario.
   - e. Maritime Provinces.
4. **Markets.**
   - a. Domestic.
   - b. Foreing.

Conclusion.

Until recently, the only salt deposits in Canada being exploited, were those located in Ontario, hence this province has been at a great advantage economically. With the discovery of rock salt at Malagash, N. S., and the prospect in the near future of operating deposits in the vicinity of McMurray, Alberta, considerable of the expected increase in the domestic demand will in a few years be available from these newly operated deposits.

The rapid development of the country during the Great War has led to the establishment of new manufacturing industries utilizing the natural resources of the country. The salt industry has, naturally, been influenced by this growth and plants have already been established in certain parts of the Dominion to utilize the large deposits of sodium chloride, as a base from which to produce other commercial chemicals. Past enterprise in this direction has only touched the fringe of the available resources. The chances of profitable exploitation and investment along this line of industry are worthy of serious consideration.

In order to bring to your notice the salient points of this subject I wish to describe briefly to you the merest outlines of the technology of the salt industry; to cover the uses of salt as shown in the table of contents attached; then to summarize the present known salt and brine deposits of Canada commencing from the Pacific and concluding with the deposit in which you will be most interested at these meetings, namely, the Malagash deposit of rock salt in Cumberland Co., Nova Scotia. I will conclude with a few remarks on the probable markets, both domestic and foreign, which have special bearing on the Malagash deposit.

1. The Technology of the Salt Industry.

The technology of the salt industry has, like many other industries, made great advances in the last twenty years. The improvements, however, have been along mechanical lines rather than chemical processes and all improvements tend to increase the production with the minimum amount of fuel.

The following flow sheet gives, at a glance, the methods employed in the recovery of commercial salt from nature.

Commercial salt is obtained from two sources in nature: a. rock salt, b. natural and artificial brines.

Rock Salt.

Rock salt is found in many countries in beds of such extent as to permit of it being mined or quarried; or else recovered by dissolving the beds with water and pumping the resultant brine to the surface, to be evaporated.

1. The Mining and Milling of Rock Salt.

Where the salt beds are sufficiently near the surface to enable the salt to be recovered directly, the common practice is to either quarry it or mine it by the pillar and chamber method. In the former case it is taken from an open quarry, possibly with very little stripping. Mining is generally carried on from a shaft sunk to tap the deposits. Galleries are run, and chambers mined out on each side of the gallery, leaving pillars at regular intervals.

The salt from both quarry and mine is generally crushed between cast iron rolls, after which it is screened. The coarse lumps are sold as lump salt while the material passing through the screens is fed into buhr mills. The ground salt from these buhr mills is passed through pneumatic separators, which take out the dust, and separate the market salt, or else it is screened into the different grades. When the salt is too impure to handle in this manner, it is dissolved in large tanks, and the saturated brine is evaporated by one of the several methods hereinafter described.

2. Artificial Brines From Rock Salt.

Where the beds of rock salt are at too great a depth to be worked economically by mining methods the common practice is to put a drill hole down to the beds and dissolve the salt by means of water, afterwards pumping the saturated brine to the surface and evaporating it.

The drilling of the wells is accomplished by the ordinary churn drill, common to oil drilling practice: The diameter of the holes at the collar being between 8″ and 10″. It is customary to carry the hole several feet through the salt bed, and to blast or torpedo the bottom in order to form a collecting chamber for the brine, when formed. The hole is then cased, to ensure that the brine will not escape through some of the overlying porous strata.

There are several methods employed in the pumping of the brine.

In the northern part of the Ontario salt field, where underground waters form the solvent for the salt, the most common practice is to pump the brine through the casing of the hole, by means of a plunger pump —after the Cornish pump pattern, with walking beam. In the southern part of this field, where water has to be forced down the hole, the common method adopted is to case the hole down to the top of the salt strata, and then to put down an inner piping, almost to the bottom of the hole. The case pipe has a diameter of from 6″ to 8″, and the inner piper from 3″ to 4″. The joint at the top between case pipe and the hole is made tight by a heavy rubber washer. Fresh pure water is then forced down the space between the outer casing and the inner pipe under sufficient pressure to cause the brine to flow up the inner tube. The brine pipe reaching to the bottom of the cavity ensures a saturated solution ascending to the surface.

A third method, sometimes adopted is to pump the brine by means of compressed air. In this method the double tubing is also required, air being forced down the inner tube, and allowed to rise through the outer tube, carrying with it the brine.

The brine coming from the wells is piped to settling tanks, where it is allowed to stand for a certain length of time, in order to allow any sediment or mechanically suspended matter to settle. In these tanks the brine is sometimes treated with lime, to precipitate any gypsum present; and in some plants is partially heated by means of exhaust steam, so that time will be gained when the brine is fed into the evaporators.

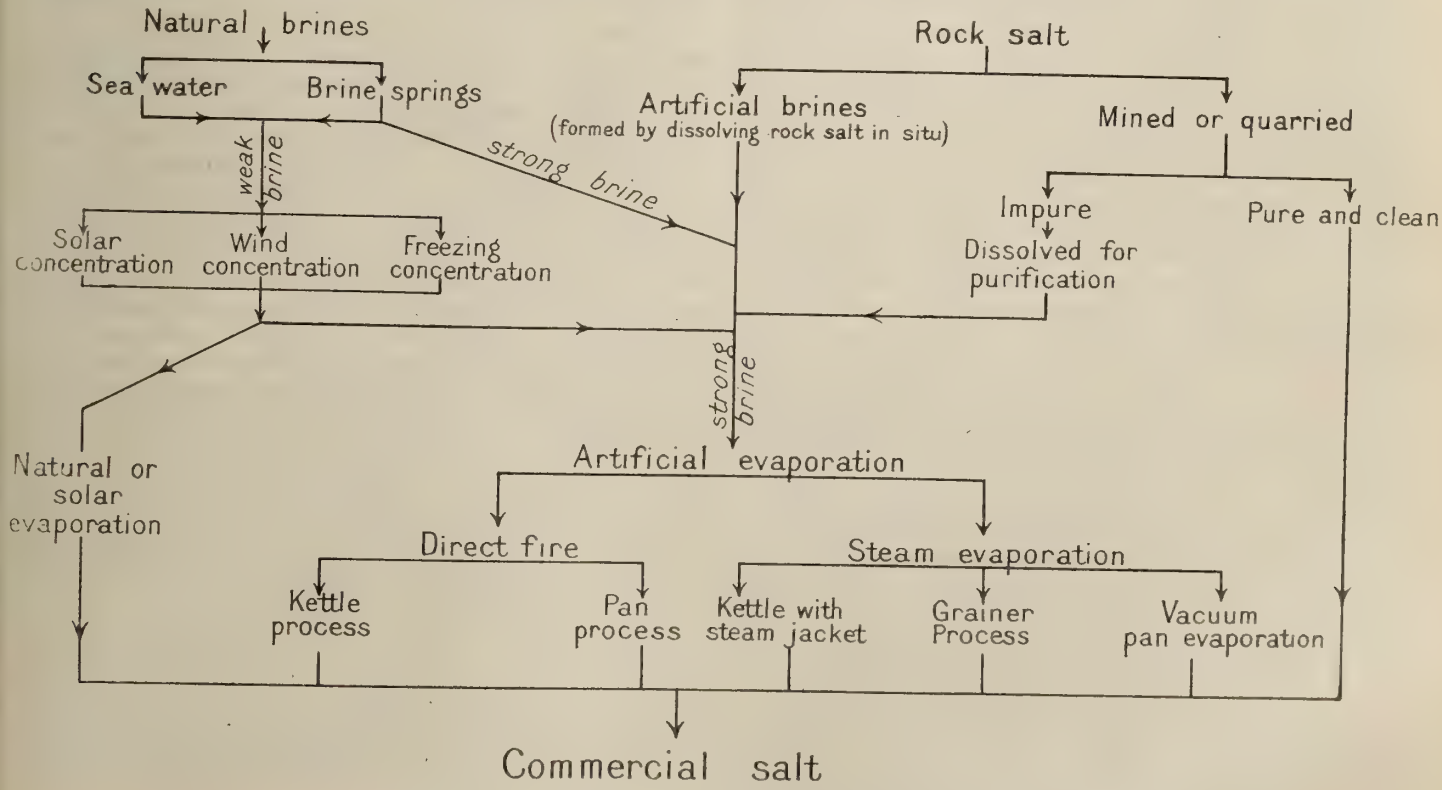
Salt From Brines.

In the recovery of salt from brines there are several methods being employed. These can more readily be followed by studying figure I. The three main processes for salt manufacture from either natural or artificial brines, are Solar Evaporation, direct fire evaporation and steam evaporation.

1. Solar Evaporation.

The recovery of salt from sea water and weak brines, has, in nearly all cases, been made by the solar method: employing the agency of the heat of the sun and the evaporating power of the wind. This method has not been employed with any great success in Canada, and it is doubtful if it will ever become a factor in the methods employed for preparing salt for the Canadian market. Briefly the method of preparing salt by solar evaporation may be described as follows:

Sea water or brine is allowed to run or is pumped into salt ponds or artificial vats and there allowed to stand, till all the impurities are settled out after which the purified brine is run into pickling ponds or vats where it is exposed to the sun and air. In these the brine is allowed to remain till, due to the evaporation of the excess water the brine has become saturated. It is then conveyed to the crystallizing ponds or salt rooms where the evaporation continues and the salt crystallizes out completely. The salt is then recovered and prepared for the market.



2. Direct Fire Evaporation.

Kettle Process. One of the earliest methods employed in the salt industry consisted in evaporating the brine in large hemispherical kettles, over an open wood fire. An improvement was shortly made in this method by setting the kettle in an arch of masonry. Later, two kettles were employed, then four, using the same fire, and finally, the kettles were placed in long rows, as high as 30 or 40 in each row; with one common fire box, and a common stack for several rows. The salt formed was removed by hand, and placed in baskets to drain. The method was, at best, very wasteful of fuel, since in order to heat the kettles furthest away from the fire box, heavy fires had to be made, and this caused an excessive heat under the nearest kettles. Naturally, on account of this difference in heat under the different kettles, a uniform grade of salt could not be obtained. Due, therefore, to these, and several other drawbacks, the kettle method of evaporation was gradually replaced by the English open pan method.

Pan. Process. As first adopted in Canada — upon rejection of the kettle method, the pan employed consisted of a long shallow pan placed upon two walls, with a fire-place at one end and a chimney at the other. These pans were made of ¼″ boiler plate, and were from 40 to 50 feet long, 12 to 20 feet wide, and 10 to 12 inches deep. One fire grate was used, and the products of combustion passed under the pan, and directly up the chimney. The best practice of the present at plants where the open-pan method is employed is, to have two or four pans in one "block," as these salt plants are called. If, for example four pans are employed, they are arranged in pairs, side by side; the pairs being placed end to end, so that one common chimney or stack is utilized for all four pans. Where the furnace gases pass under the length of the pan, and are then allowed to escape, the pan is generally divided into two compartments, two grades of salt being made in each pan; fine salt in the compartment nearer the fire grate, and coarse salt in the compartment farther from the fire, where evaporation is much slower. An arrangement by which an even grade of salt is made throughout the pan is, to divide the space underneath the pan into three chambers, and to allow the furnace gases to pass through the two outside ones, and return to the stack by the middle flue. The stack in this case is located beside the fire grate. This system has, in the base of a "block" of four pans, the advantage that all the fire boxes are situated on either side of one passage way, and can be attended to much more easily than if two were at either end.

The pans are made of ¼″ boiler rivetted together. The length varies from 90 to 120 feet, and the width from 18 to 24 feet, with a depth of 12 to 14 inches. The salt is removed as fast as it is formed by means of long scrapers. Between the two pans a walk, 6 to 8 feet wide, is placed, from which the man operates the rake. The sides of the pan are generally sloping, and bolted to the drainage boards (6 feet wide). The salt can then be raked directly from the pans on to the boards, and left there till thoroughly drained, before being removed in two wheeled carts to the drying bins. It is necessary that the salt be removed at prequent intervals, so that it will not cake on the bottom of the pan, and thus retard the conduction of the heat through the pan to the brine, or injure the quality of the product. If the brine is not agitated frequently by the removal of the salt by these rakes, there is a tendency for a film of crystallized salt to form on the surface of the brine as a scum, and thus prevent the escape of the steam of evaporation. The open pan method is employed in a number of the Canadian plants.

3. Steam Evaporation.

The fact that the preparation of salt by the open pan system was extravagant in fuel, and that the product obtained varied considerably, led to the adoption of other methods which utilized either exhaust or live steam.

Kettle With Steam Jacket.

The earliest use of steam in the salt industry was in steam jackets surrounding the kettles or pans of the kettle and open pan processes. A second bottom was placed under the kettle or pan, through which steam, either live or exhaust, was allowed to circulate. This produced a constant temperature in the evaporator, and thus an even product was obtained. The grainer system and the vacuum pan, however, produced the same results, and are much more economical; so that in nearly all the best plants, these processes are employed.

Grainer Process.

Grainers consist, in general, of shallow vats of various shapes, near the bottom of which a series of steam pipes are placed, through which steam is allowed to circulate, and heat the brine. These vats are generally rectangular in shape, with a depth of from 18 to 24 inches, a width of from 8 to 16 feet, and a length of from 60 to 120 feet. They may be built either of wood, lined with tile for protection, cement, or steel.[1]

The pipes are arranged after the manner of ordinary heating coils, so that the steam entering at one end passes through the whole series of coils before leaving the grainer. The pipes are generally 2″ diameter.

In best practice the salt is removed from the grainers by some continuous, operating form of mechanical rake. The two types most commonly used are the endless chain raker, and the reciprocating raker. In the former style of rake the lugs on the chain drag along the bottom of the grainer, carrying the salt with it, and deposit it on the inclined draining board at the end. This rake has the disadvantage of having the chain exposed to the corrosive action of the air while returning to the front of the grainer and the rust so formed is liable to discolor the salt. In the reciprocating rake, a rigid frame is operated back and forth on angle ledges on the sides of the grainer, the lugs on which frame are so fastened that on the back stroke they trail over the top of the salt and only push the salt along the bottom and up the incline on the forward stroke. The reciprocating motion is obtained by means of a hydraulic cylinder placed at the end of the grainer. The salt is thus shoved gradually up the draining board, from the top of which it falls into a trough, through which a conveyer runs, and carries it to the drying bins.

---

[1]One variation in the grainer type that is quite common is the V-shaped grainer. In this type a scraper conveeyr runs along the bottom of the vat and scrapes the salt as formed to the end of the evaporator, where it is removed by an elevator. The pipes are placed above this conveyer.

These grainers may use either live or exhaust steam. The temperature can be regulated at will, so that the grainer can be made to produce whatever grade of salt is required.

Vacuum Pan Evaporation.

The application of the vacuum pan process to the manufacture of salt is a comparatively new departure. Although vacuum pans have been employed for many years in the sugar and other similar industries, it was not until the year 1887 that the first vacuum pan for the manufacture of salt was placed in operation. This pan was erected by Mr. Joseph Duncan at Silver Springs, N. Y. From that time their use has extended with gradual improvements, to all the more modern plants on the American continent.

The principal upon which the vacuum pan process is based is, that, when the pressure on the surface of the brine is decreased, the boiling point of the brine is correspondingly lowered. The brine can then be evaporated with a great saving in the amount of heat required. The heating medium employed in evaporation of the vacuum type, is steam, either live or exhaust. No vacuum evaporators have been, so far, designed to successively operate by direct heat.

Vacuum evaporators may be operated in series as double effect, triple effect, quadruple effect, etc. When the pans are employed in this manner, the steam formed by the evaporation of the brine in the first pan is conducted to the heating chamber in the second pan, in which a greater vacuum is carried. Likewise, the steam generated from the brine in the second pan is led to the steam chamber in the third pan, where a still greater vacuum is maintained. Similarly, each pan is heated by the steam produced in the preceding pan, for as many pans as are operated in series. The steam from the last pan is carried to a condenser. The vacuum in each pan is created by the condensation of the steam in each succeeding steam chamber, the vacuum in the last pan being produced by a vacuum pump.

The construction of the several types of evaporators employed in the salt industry varies only in a few minor details. They consist essentially of four parts, namely:

(1) The evaporating and condensing chambers,
(2) The heating element,
(3) The coned bottom,
(4) Salt filter, or barometric leg.

Evaporating and Condensing Chambers.

The main body of the evaporator may be built of steel, cast iron, or copper, generally circular in cross section, and either cone, or dome-shaped at the top. The height of this chamber varies with the diameter, and is made sufficiently high to prevent the escape of any of the brine by entrainment, or foaming. In order to prevent a loss of heat by radiation, the evaporation chamber is covered completely (as well as all other parts of the evaporator) with a heavy coating of asbestos packing. The condensing chamber is of the usual type, furnished with a vacuum pump.[1]

The Heating Element.

Two methods of applying heat to evaporate the brine are employed. In the first, a steam chamber is placed between the evaporating chamber and the coned bottom, in which a series of copper tubes, varying from two to four inches in diameter, are fastened vertically in the top and bottom plates of the chamber. These tubes are open at either end, and thus permit free circulation of the brine between the cone-shaped bottom, and the evaporating chamber. The steam is passed into this chamber, and circulates in and out around the tubes, thus heating the brine circulating within them. The condensed steam is drawn off by suitable means from the bottom of the steam chest. The second method employed in heating the brine is to have the steam pass through a series of coils, or tubes, around which the brine has free circulation. In this method of heating, special means have to be adopted to properly dispose of the condensed steam, and the coils of pipe have to be so arranged as not to impede the salt, as it is formed, from descending into the cone-shaped bottom.

One of the great difficulties encountered in the application of vacuum pans to salt manufacture is the scale which deposits upon the heating surface.[1] This has to be removed at frequent intervals, or else the evaporative capacity of the pan will be greatly reduced. In order to facilitate the removal of this scale, the heating element should be either removable from the pan, or else easily accessible.

The Cone-shaped Bottom.

The bottom of the pan is sharply coned, so that the salt crystals, as formed, may readily fall to the bottom, clear of the heating tubes, and can then be drawn off from time to time. The pipe for the entry of the brine is generally attached to this cone.

The Salt Filter, or Barometric Leg.

In order that the operation may be continuous, there must be some means of removing the crystals of salt as fast as they are formed. This is accomplished in two ways: (1) by a salt filter, (2) by a barometric leg. In using a salt filter, the salt is drawn off into a filter or chamber, connected with the cone bottom. The connecting valve is closed when the filter is filled, and the salt is removed without stopping the operation of the evaporator. Sometimes two pipes lead from the cone to two filters, so that, when one filter is being emptied, the valve to the second is opened and allowed to fill. This prevents any possibility of clogging of the salt crystals in the bottom of the cone. In the barometric leg the salt falls continuously down, and is removed from the bottom by a closed elevator. This method is very efficient, when working on a large scale.

The salt made in vacuum pan evaporators is mostly of a very fine grain, and, consequently, has not entirely succeeded in replacing the grainer, the latter being able to produce varying grades of salt, according to the amount of heat supplied.

Preparation of Salt from Evaporation, for the Market.

All salt, whether manufactured in the vacuum or open pan, is generally allowed to age or season for at least two weeks before being shipped either in bulk or barrels. This seasoning gives time for the salt to become thoroughly drained and free from excess brine. The stock house in which the stock is stored is generally on the floor underneath the level on which the graiuers are situated. The salt is then wheeled

[1]When working in double or multiple effect, the heating element or steam chest of the succeeding unit is the condensing chamber for the preceding evaporator.

[1]This scale is, in most cases, composed of calcium sulphate, which is present in the original brine, and in the best practice this is largely removed before the brine enters the evaporators.

in carts along trestles over the stock house, and dumped on the floor below.

The crude salt is shipped in bulk, being placed in cars or boat by any suitable means.

When packed in barrels the packing is carried on by hand on the floor of the stock house. Each barrel contains 280 pounds net. These barrels are generally manufactured on the premises.

In the case of table and dairy salt, a further treatment is carried on before the salt is placed on the market. The crude salt is passed through long, cylindrical, rotating driers, in which a current of hot air is blown through in the opposite direction to that in which the salt is moving, i.e., in a direction counter to the incline of the drier. After being thoroughly dried, it is passed through a series of screens of various sizes, and then automatically bagged and sold as Dairy, Table, and Cheese salt. Each company has a special trade name under which it markets its product.

By-Products From the Industry.

The brine used for the recovery of salt, in many cases, contains small quantities of other salts, etc., which in some cases are recovered. Bromine, potassium salts, glaubers salts, epsom salts, and calcium chloride are some of the by-products which are being saved commercially.

2. Uses of Salt.

Salt is one of the essential materials in many of our present day industries. Its use is being extended all the time. The possibilities for extending the salt industry in Canada are good and with the return of normal conditions throughout the country the salt production should show a substantial increase. The uses of salt are numerous, but they may briefly be described as follows:

a. Domestic.

For table and culinary consumption the salt is generally required to be very white and fine, and to be as free from impurities as possible. The salt made in the vacuum pans is ideal for these purposes. In the Dairy and Cheese making industries a slightly coarser grade is required. For refrigerating purposes a coarse salt is best suited and for salting cattle, both in the stable and in the field, a coarse grade or lump salt is employed, the latter form being preferred.

b. Fish and Meat Curing.

The salt for the fisheries is generally a granular salt the bulk of which is caught by a 20-mesh screen. The color and purity are factors in the marketing of salt to the fishermen as they are very particular that the color and taste of their fish is in no way impaired. A similar grade of salt can be used for the curing of meat.

c. Metallurgical Industries.

Salt finds an extensive use in the metallurgy of copper, lead, silver and gold in chloridizing roasting and leaching processes, as well as in the refining of copper-nickel matte by the Oxford process. As high as 10% of sodium chloride is aded to the charge in some of the roasting furnaces.

d. Associated Chemical Industries.

One of the most important uses of sodium chloride is in those chemical industries which prepare sodium salts for the market. In order that some idea may be obtained of the possibilities of developing these industries I will give a brief resume of several of the more important processes for the manufacture of these chemicals from salt.

Caustic Soda. (Sodium Hydrate.)

Until the last fifty years, the manufacture of caustic soda was not extensive. The most common process in preparing this material was the one in which advantage was taken of the reaction of sodium carbonate and slaked lime. This process at first entailed the production of soda ash. Of late years, however, caustic soda has been prepared by the direct decomposition of sodium chloride in an electrolytic cell; producing chlorine gas and metallic sodium, which latter at once unites with water present in the cell to form caustic soda. The weak solution of caustic soda thus produced is concentrated in vacuum pan evaporators. From these evaporators the solution passes to storage tanks after passing through separators — to eliminate the sodium chloride. The final concentration is then carried out in finishing pots of about 18 tons capacity and the pure caustic soda is run from the final pot into iron drums (700 lbs. capacity), and allowed to solidify. The product is then ready for the market. One firm is already making caustic soda in Canada by this process.

Sodium Carbonate. (Soda Ash.)

Although sodium carbonate is often found in extensive deposits in nature, it is generally very impure. Owing to the cost of dissolving, evaporating and purifying, it rarely pays to operate a deposit of this nature except at actual points of consumption as commercial sodium carbonate can be prepared artificially from sodium chloride at less cost.

In the artificial preparation of sodium carbonate there are three processes of importance which use sodium chloride as a raw material. These three processes are: (1) the Solvay, or ammonia-soda process, (2) the electrolytic process, (3) the Le Blanc process.

(1) The Solvay Process.

This process is based on the well known reaction of ammonium bicarbonate on sodium chloride, with the separation of part of the sodium as sodium bicarbonate. The raw materials required for this process are limestone, sodium chloride (either as brine as it comes from the wells or rock salt dissolved) ammonia (either in the form of an ammonium hydrate solution or ammonium sulphate) and fuel.

In brief, the essential operations in this process are, to manufacture carbon dioxide from limestone; to pass this gas into the ammoniacal brine which has previously been prepared by saturating the brine with ammonia gas; the separation of sodium bicarbonate which forms as a precipitate from the solution; and the calcining of this precipitate to form sodium carbonate or soda ash. The product of this method is remarkably pure and will average over 98.5% sodium carbonate, the principal impurity being sodium chloride.

(2) Electrolytic Process.

An electrolytic process for the manufacture of sodium carbonate crystals by the electrolysis of brine has been operated commercially on a small scale, in England. This process, known as the "Hargreave and Bird process" employs a diaphragm cell of unique arrangements. The diaphragm is impervious to the salt solution, but permits the sodium ion to pass to the cathode. As the sodium ions are set free, they are converted into soda crystals by the blowing in of steam and carbon dioxide. The sodium carbonate made by this process is very pure and will average when dehydrated 97.5 to 98% Na_2CO_3.

(3) The Le Blanc Process.

This process for making sodium carbonate from salt consists of first making sodium sulphate — to be later described — and then fusing this with a mixture of limestone and carbon. The raw materials required are sodium sulphate (salt cake), pure limestone and a good grade of coking coal. The reactions are involved but the process in brief, is as follows: The salt cake, limestone and coal in predetermined proportions, are fused in a furnace and the fused mixture, called black ash, which is produced is allowed to cool. The black ash is then lixiviated with water and the resultant lye is purified giving commercial sodium carbonate which will vary in composition from 75 to 98% Na_2CO_3. The finished product from this process should be white or nearly so.

Both the crystal form and the soda ash are met with in commerce. The crystal form known as soda crystals or washing soda has the formula $Na_2CO_3 . 10H_2O$. These crystals readily dehydrate and effloresce when exposed to the air.

Sodium Sulphate (Salt Cake.)

Like sodium carbonate, sodium sulphate occurs naturally, but owing to the artificially manufactured substances being so cheap, it seldom pays to use the natural deposits.

The commonest process for producing sodium sulphate is by the action of sulphuric acid on sodium chloride. The salt for this process is preferably rock salt, or the coarsest salt produced from evaporation.

The process may be carried out in two ways: (1) sulphuric acid, as such, may be added directly to the salt or (2) sulphur dioxide, oxygen and steam may be added to the sodium chloride.

By the first method the acid sodium sulphate is formed, and this reacts again with salt to form sodium sulphate.

In the second method, known as the Hargreave process, steam and oxygen are caused to combine with sulphur, dioxide to form sulphuric acid which simultaneously attacks the salt, forming sodium sulphate and hydrochloric acid, as represented by the following equation:

$$4NaCl + 2SO_2 + 2H_2O + O_2 = 2Na_2SO_4 + 4HCl.$$

Chloride of Lime (Bleaching Powder.)

When dry chlorine gas is passed over a thin layer of slaked lime, a compound is formed which has the power to readily give up its chlorine, when acted upon by an acid.

In brief, the process generally employed in the manufacture of bleaching powder is to utilize the chlorine gas produced by the electrolytic decomposition of sodium chloride and pass it through a series of lead-lined chambers in which slaked lime is spread on the floor to a depth of about two inches. Generally a number of these chambers are operated in series. The bleaching powder is discharged through openings in the chamber floor to the shipping room beneath. It is then packed in drums of 700 lbs. capacity.

The percentage of bleach in the chloride of lime thus produced will vary from 37 to 39 per cent. chlorine, i.e., the bleach contains from 37 to 39 per cent. chlorine that is available for bleaching purposes.

I have devoted considerable space to the sodium salts as these are of great importance, and it is only within the last ten years that any of them have been manufactured in Canada. The rapid growth and commercial progress made by the Dominion during the last few years has greatly increased the demand for those chemicals into the manufacture of which sodium chloride enters either directly or indirectly as one of the principal raw materials. The increasing demand for these chemicals — as evidenced by the figures of imports shown in the following table, has naturally evoked the question whether they cannot be manufactured in Canada. This question has been partially answered by the fact that one company is already successfully producing caustic soda and bleaching powder from sodium chloride in the form of brine, and another company has a plant completed for the production of soda ash by the Solvay process. There are several other chemicals in the manufacture of which sodium chloride is used; and there is no reason why use should not be made of the extensive salt deposits of Canada for their production. In view of the rapidly increasing market there should be no difficulty in the disposal of the products of such undertakings.

e. Incidental Uses of Salt.

Besides the uses already mentioned there are a number of other markets for salt, such as in the construction of wooden ships, the salt glazing of pottery and for the preventing of cracking of bricks in drying and firing, and in the manufacture of carborundum. A coarse grade of salt is also used as a land dressing for certain crops.

3. THE SALT DEPOSITS OF CANADA.*

Salt producing springs or beds of rock salt have been encountered in nearly every part of our Dominion. A number of the springs, of course, are only weakly saline, but may indicate the presence of beds of rock salt in the vicinity.

*For more detailed descriptions of the salt deposits of Canada see Salt Deposits of Canada and The Salt Industry. L. H. Cole, Mines Branch report No. 325, 1915.

Imports of Caustic Soda and Chloride of Lime.

	Caustic Soda		Chloride of Lime	
	Pounds.	Value.	Pounds.	Value.
1910	13,974,444	$267,338	10,386,519	$116,923

Note.—For purposes of comparison the pre-war years—1912-13-14 should be examined.

a. British Columbia.

Until the last few years, the known occurrences of salt in British Columbia were in the form of a number of saline or mineral springs, the waters of which are more or less saline.

In August, 1911, however, reports came in of the discovery of a strong saline spring 45 miles from Prince Rupert, situated on the banks of the Skeena river, at Kwinitsa, on the line of the Grand Trunk Pacific railway. That year, the location of the spring was staked and recorded by one of the cooks in the construction camps. Experiments were carried on in a crude way and it was found that the brine was strong enough to collect considerable quantities of a good quality of salt, by evaporation.

Early in 1913, a syndicate of western men started drilling operations in an endeavor to locate rock salt at this point, and in April of the same year, their efforts were rewarded — according to reports — by encountering salt in five different holes. During 1913, some 15 tons of salt were produced from this deposit. A company entitled the British Columbia Salt Works, Ltd., Prince Rupert, B.C., was organized and expected to have a plant operating by the fall of 1914, but due to the war the project was abandoned for the time being.

Of the known brine springs occuring elsewhere in the Province, the most strongly saline are those at Nanaimo, Admiralty or Salt Springs island, Chilcoton Valley, and Maiden Creek, and Bonaparte Valley, northwest of Ashcroft, B. C. The flow of these springs is not so copious, or the strength of the brine sufficient to warrant a belief in their economic importance at the present time.

b Alberta, Saskatchewan and North West Territories.

In the prairie provinces of Alberta and Saskatchewan as well as the North West Territories, numerous saline springs are known to occur. Up to the present time, however, these have not been economically important, owing to their inaccessibility to ready markets. Moreover, very little is known about them, and so far I know of only one definite attempt to prospect for rock salt in place. Since the springs occur over such a wide area, it is possible that stronger brines, in more favorably situated localities may yet be found, and there is always the possibility of finding beds of the mineral in place near the surface. The Mackenzie basin, in which all the springs at present known, occur, has been lacking, until recently, in railway transportation. With the advent of the railway into McMurray, it is altogether likely that this district will become a salt producer, and furnish this necessary article of consumption to a portion of the prairie provinces and British Columbia.

Probably the most important occurrence of salt in the district in question is that of the Northern Alberta Exploration Co. This company has, since 1907, been carrying on drilling operations for oil in the vicinity of McMurray, Alta. Two wells have been sunk, in both of which they claim to have encountered rock salt or salt bearing formation. The first hole has been drilled to a depth of 1475 feet, while the second reached a depth of 1406 feet. The collars of the holes are 155 feet apart and according to the logs of the wells (here given) show the same formations in each hole.

Soapstone and Limestone.	520 "	590 "
Salt formation	620 "	690 "
Limestone	635 "	765 "
Salt Formation	740 "	855 "
Limestone	770 "	935 "
Sandstone	1475 "	1406 "

There is a possibility that this coming summer a plant for the preparation of salt from brine may be erected on this property.

Of the brine springs, the most accessible seem to be those occuring at La Saline, 26 miles north of McMurray and these have from time to time been noted by the several explorers of the district. The brine will run about 25° salinity, 100° being a saturated brine.

Other saline springs are found at numerous points further north in the Mackenzie basin, notably at Salt River, Slave River District; Tar Island, Peace River, Red Earth Creek, and Great Bear River, North West territory.

In the plain lying to the north of the Cypress hills, Saskatchewan, numerous small lakes occur which are more or less saline and there are also many alkali lakes throughout the prairie provinces which carry small quantities of sodium chloride associated with other salts.

c. Manitoba.

Beds of rock salt have not, as yet, been discovered in the Province of Manitoba, but numerous brine springs are known, and from these, in past years, salt has been recovered by evaporation. When first these springs became known, the area in which they occurred seemed to be limited to the district lying to the west of Lake Winnipegosis, and this still remains the only district in which natural flowing springs occur. Of late years, however, in drilling operations in the vicinity of the city of Winnipeg and the district to the west as far as the boundary line between Saskatchewan and Manitoba, brines have been encountered in numerous holes and wells. Further drilling will most likely demonstrate a considerably larger area under which brine waters may be found.

The saline springs in the northern part of the province have, in past years, been utilized for the manufacture of salt. For the convenience of reference only the localities where these waters have been found have been divided, tentatively, into three districts.

The Winnipegosis District.

In this district the saline waters all appear in the form of flowing springs. The area in which these springs occur, is approximately confined to the west shore of Lake Winnipegosis, and the district between Lake Winnipegosis and Porcupine and Duck mountains on the west. The southern boundary is Dauphin lake; and the northern boundary the northern shore of Dawson bay. In this area, as outlined, numerous saline springs are known to rise to the surface through the till which covers the district in question.

The topography of the district is that of low lying country, at an average elevation of only a few feet above the level of the water of Lake Winnipegosis. To the west, the prominent ridge of the Manitoba escarpment rises to a height of from 1,000 to 1,500 feet above the surrounding country. The whole area is, with the exception of small portions of the southern part, covered with a growth of small pine, spruce and poplar, which increase in size farther to the north.

The saline springs throughout this district are very numerous, and many small saline areas can be noticed where the brine oozes up through the overlying drift.

The areas in the Winnipegosis district visited by the writer were all very similar in appearance, and one general description for them all will suffice. In general, they consist of a barren area, varying from a few acres to over a hundred acres in extent, devoid of any vegetation, with the occasional exception of scattered patches of the red salt plant (Salicornia herbacea). Surrounding these areas there are generally a few acres of meadow land, with timber consisting of pine, spruce, and poplar, enclosing the whole area

Here and there in the barren flat, saline springs bubble through the till, forming in some cases small truncated, conical mounds of reddish sinter, in the centre of which lie clear pools of brine. In some of these springs bubbles of gas are constantly rising. The brine, flowing from the pools, spreads over the whole flats, and either evaporates — leaving a thin deposit of salts or, if the flow is strong enough, forms a small stream of brine.

Occasionally, the brine is found in lakes or pools some 20 or 30 feet in diameter, in which the surface is constantly constantly moving, owing to the bubbling up of the brine from below. These are surrounded by mud flats covered by a sod of coarse bunch grass. The ground in the vicinity of this type of spring is generally marshy.

The brines of all springs vary greatly in their salt content and will range from 10° to 26° salinity.

Westbourne District.

The region included, in this district, covers the area lying to the west of Portage la Prairie and the western boundary of Manitoba and south of the town of Dauphin. In this district, several saline areas occur, and a number of drill holes have encountered saline waters. The principal localities where saline waters have been noted are, in two wells near Gladstone, Man., in a saline spring seven miles west of Westbourne and in a well drilled for gas, about 200 yards from the C. P. Ry. station at Neepawa. In this latter hole two flows of strong brine were encountered at depths of 1225 feet and 1455 feet respectively. It is interesting to note that the brine from this last well, although high in calcium chloride and calcium sulphate, contained the highest sodium chloride (common salt) content of any examined from Manitoba. The total solid content was 190.896 grammes per litre or approximately 72° salinity.

Winnipeg District.

A syndicate of Winnipeg men have drilled 7 wells in the district within a radius of 20 miles of Winnipeg and in five of them they encountered water of a more or less degree of salinity. In all cases, however, the brines thus encountered were not of sufficient strength from which to commercially manufacture salt.

d. Ontario.

Ontario, at the present time, is the centre of the salt industry of Canada. The salt obtained in this province is recovered by the evaporation of brine which has leached out rock salt from beds which occur in the Saline formation in the southwestern part of the Province bordering on Lake Huron; the St. Clair river; lake St. Clair; and the Detroit river. It is im possible, with our present knowledge, to determine definite boundaries of the salt basin; but, as far as it now stands proved, the area underlain by salt in Ontario is approximately contained within lines joining the towns of Kinkardine, Teeswater, Brussels, Seaforth, London, St. Thomas, on the west; and Thamesville, Dresden, across lake St. Clair, through Elmstead to a point on the Detroit river between Amherstburg and Sandwich. The area enclosed within this boundary in Canada is about 3,000 square miles.

The salt beds are known to vary in thickness. In some wells they occur in thin beds interstratified with dolomite and shale; the total combined thickness of all these beds varying from 100 to 200 feet. In other localities, as in the case of the beds at Windsor, the salt beds are of great thickness, one bed alone having a thickness of 200 feet. The average depth at which the salt is found is in excess of over 1,000 feet, there being a gradual increase in depth of the beds as one goes farther south.

The production from a few wells has hitherto been sufficient to supply the domestic demand, and little exploration has been carried on by which the area underlain by salt can be definitely outlined. There has, however, been a great deal of exploratory work in connection with the development of petroleum and natural gas fields. Where these boreholes extend below the salt horizon, they give evidence of either the presence, or the absence of salt.

From the records available, it would appear that within the area mentioned, the salt beds are practically continuous; there are, however, some limited areas within these boundaries where — according to the records of drill holes that have penetrated below the Salina — there are no salt beds.

The southeast boundary of the salt area is at present unknown, as no drill records are obtainable from the district along the north shore of Lake Erie between St. Thomas and Chatham. Records from a hole at Orford, Kent county, show 171 feet of salt, at 1,510 feet below the collar of the hole; while another from Glencoe shows 104 feet of salt, at 1,290 feet below the surface. These records lead one to believe that possibly the beds are dipping to the southeast and may be found by deeper drilling in the vicinity of Lake Erie.

The southwestern boundary merely marks the dividing line between the area beneath which salt beds are encountered, and the area where brines of a more or less density were found, although no rock salt was obtained.

The salt beds are supposed to extend under the Detroit river; Lake St. Clair, St. Clair river, and the southern part of Lake Huron, since rock salt has been found in the Salina formation in the State of Michigan, on the opposite side of the International Boundary.

All the salt is obtained from the evaporation of waters which have been allowed to remain in contact with the salt beds until a saturated solution has been formed. The water employed is derived either from natural underground springs, or else is forced down through the cased drill holes penetrating the salt beds. The brine produced in this district is very pure and seldom requires the addition of any chemicals to precipitate impurities. An analysis of brine taken from one of the salt wells in this district showed the following composition:—

	Per cent.
$NaCl$	26.6415
$CaCl_2$	0.1895
$MgCl_2$	0.1884
$CaSO_4$	0.2757
H_2O	72.7049
Total	100.000*

*F. G. Wait, analyst.

The salt is prepared by one or other of the methods previously described in this paper.

Brine from this district is already being used at Sandwich, Ont., in the manufacture of caustic soda and chloride of lime and another plant has been recently completed for the manufacture of sodium carbonate (soda ash) at Amherstburg.

e. Maritime Provinces.

New Brunswick.

In this province no beds of salt have, so far, been discovered. Several localities, however, are known where brine springs have been observed. These springs apparently have their origin in the rocks of Lower Carboniferous age. Small quantities of salt were manufactured each year from the brine of these springs; but for the last ten years, operations have ceased. The best known localities are at Sussex, and Salt spring brook, both in Kings county; and on the Tobique river, Victoria country.

Nova Scotia.

In the province of Nova Scotia no deposits of salt with the exception of the Malagash deposit, have, so far, been discovered; but numerous saline springs of a greater or less degree of salinity are known to occur. These springs, where noted, seem to have their origin from the beds of the Lower Carboniferous formation, and are closely associated with the gypsum deposits which occur so extensively in this formation, throughout the province. Numerous drill-holes have been put down throughout the province, passing completely through the Lower Carboniferous formation, but in none of them has rock salt been found.

Attempts have been made from time to time to manufacture salt on a commercial scale from these springs; but where have all been abandoned. At the present time there is no production of salt in the province. The weakness of the brine, and the consequent high cost of production, have, so far, made it impossible to compete with the Ontario salt, or that imported from the United States, or Great Britain.

A few of the places at which brines occur will be mentioned.

Whycocomagh:—Brine springs have been noted half way between Baddeck and Whycocomagh, on the road running along the northwest shore of St. Patrick's channel. The brine has a strength of about 19° salinity.

Antigonish:—In the vicinity of the village of Antigonish and in the adacjent district numerous saline springs and ponds are found. A brine flow was encountered in this district at a depth of 159 feet from the surface. A number of years ago an attempt was made to utilize this brine and a considerable quantity of salt was made, but the brine becoming weak, the work was abandoned.

Spring Hill, Cumberland Co.:—Attemps have been made to manufacture salt at Spring Hill from a brine spring which was reported to be about 30° salinity, but operations were soon abandoned.

Cheverie, Hants Co.:—In two bore holes drilled at Cheverie, strong brines were encountered at depths of 1400 and 1870 feet, respectively. The brine was reported as having a strength of 76° salinity. Other springs have been noted at Walton, Hants Co. and Salt Springs, Pictou Co.

With the discovery of a deposit of rock salt at Malagash, Cumberland Co., Nova Scotia, the prospect for extending the salt industry to this province looks very encouraging. This is the first known discovery of rock salt in the Maritime Provinces and the first in Canada to be discovered at a depth sufficiently shallow to enable it to be won economically by actual mining.

Discovery and History of the Malagash Deposit.

Some time in 1912 Mr. Peter Murray drilled a well for water on his farm on the Malagash road, about 7 miles northeast of Malagash Station, a station on the C. G. Ry. branch line operating between Orford Jnc. and Pictou. He encountered salt water and sent a sample of the same to Dr. F. Shutt of the Dominion Experimental Farm at Ottawa. Dr. Shutt reported on this sample as follows:

	Malagash Brine, N. S.	—Western Ontario Brine—			
Sodium (Na)	99.50	96.270	101.728	96.368	100.397
Potassium (K)	0.55	n.d.	n.d.	n.d.	n.d.
Iron (Fe)	0.07	n.d.	n.d.	n.d.	n.d.
Calcium (Ca)	1.37	1.552	1.630	2.496	1.531

Ferric Oxide (Fe_2O_3)	0.10	n.d.	n.d.	n.d.	n.d.
	259.54	250.818	265.001	252.983	262.336
Sp. Gravity at 15.5°C.	1.200	1.197	1.2045	1.178	1.198

"Our analysis of this water shows it to contain 28.83% total solids, of which 28.32% is common salt. It is in fact a very strong brine.

"There are present very small quantities of sulphate of lime and possibly of allied compounds, but essentially this is a saturated, or practically saturated, solution of common salt."

No action was taken with regard to this discovery until the early month of 1917 when another sample was forwarded to Dr. Shutt who reported 26.65% common salt content. At this time Dr. Shutt referred the parties interested to Dr. Haanel, Director of the Mines Branch, Department of Mines. The Mines Branch immediately obtained another sample and had it analyzed. It was found to be a saturated brine, its analysis being given in the accompanying table, together with four analyses of brine from the Western Ontario district, for comparison.

As a result of this analysis it was suggested that further exploration was desirable in order to ascertain if the parent salt bed could be located. It was also decided that the writer should visit and examine the locality at the earliest possible moment. When the locality, therefore, was visited in June, 1917, brine had been encountered in several other holes. A personal examination of the local conditions convinced the writer that there was a good possibility of discovering rock salt in place, and he strongly advised the owners to continue their prospecting along lines already advised. Subsequent development has demonstrated that these deductions were sound.

In the summer of 1917, A. R. Chambers and George McKay of New Glasgow, N. S., took an interest in the operations and drilled a series of holes, after which they sank a prospect shaft—June, 1918. In this shaft rock salt was encountered at a depth of 85 feet from the surface and when the locality was again visited by the writer on October 10, 1918, it had penetrated to a depth of 17½ feet in the salt formation. Since then I have been informed that the shaft has penetrated about 25 or 30 feet in the salt formation and that they are now drifting on the deposit.

The overlying beds penetrated by the shaft appear to be in a nearly horizontal position and consist of clays, soft shales, gypsiferous muds, etc.

The underlying saline beds appear to dip to the west of south at an angle of about 25° and have a strike of S.70°E.

The saline beds as encountered in the shaft, show, in the upper 12 feet, considerable impurities in the form of mud, but there appear to be banded layers of whiter rock salt as one goes deeper. The indications from a drill hole located on the site of the shaft, are that the salt beds have a thickness, at this point, of at least 50 feet.

The saline beds are found associated with beds of gypsum, mapped by Fletcher as of lower Carboniferous age. These gypsum beds are seen exposed on the shore to the north of the shaft. To the south of the shaft there is a small unmapped outcrop of what appears to be New Glasgow conglomerate. The salt beds are on the south slope of an anticline, and little is so far known as to their lateral extent. To the west, about one mile from the shaft, there is a pronounced fault shown in the shore section, and this may cut off the western extension of the beds. To the east, about the same distance, the occurrence of a marsh, caused by the sea eroding the northerly lying and protecting sandstone barrier, may determine the eastern extension of the deposit. The evidence at hand, however, indicates the presence of a salt formation of considerable extent. On the basis of data obtained from the shaft, from surface indications, and from the drill holes, it is possible that the saline formation, measured at right angles to the dip, may have a thickness of 175 feet.

A general sample of the whiter rock salt was taken for analysis with the following results:

	Dried at 110° C.
Sodium (Na)	38.45
Potassium (K)	0.20
Iron and aluminium (Fe and Al)	none
Calcium (Ca)	0.25
Magnesium (Mg)	trace
Sulphuric acid (SO_4)	.61
Chlorine (Cl)	59.35
Insoluble in water	1.05
Total	99.91

	Conventional Combination.
Sodium chloride (NaCl)	97.60
Potassium chloride (KCl)	0.40
Magnesium chloride ($MgCl_2$)	trace
Calcium chloride ($CaCl_2$)	none
Calcium sulphate ($CaSO_4$)	0.86
Ferric oxide (Fe_2O_3)	none
Insoluble in water	1.05
Total	99.91

Analyst: T. W. Hardy, Mines Branches.

Although the quantities of potash salts present in the two samples examined from this locality are small, it does not of necessity mean that they are absent in commercial quantities in this area. The drilling and prospecting so far carried out have only in the most superficial way indicated the present of a large bed at one horizon, and the probability of encountering potash salts, interbedded with the sodium chloride at other horizons than the one penetrated by the prospect shaft and drill holes, is quite within the bounds of possibility.

There is an interesting point which may be worthy of noting in passing, with reference to this deposit. When sinking the shaft a flow of gas was met with at one part of the workings. A sample of this was forwarded to us for analysis and the following are the results obtained on this analysis:

Chemical Analysis.

Carbon dioxide	% 0.13
Oxygen	% 5.37
Methane	% 5.80
Nitrogen	% 88.70

Technical Analysis.

Air	% 25.66
Fire damp	% 5.80
Black damp	% 68.54

Chemist: James Moran.

Mr. Moran in referring to this gas in his report says in part:

"Regarding danger from this gas, we may say that it is dangerous to breathe for more than a few minutes. It is not poisonous, as if carbon monoxide, sulphuretted hydrogen, etc., were present; but its low oxygen content makes it impossible to support life any length of time.

"As to its apparent non-inflammability, this was due to the deficiency in oxygen. There was not enough oxygen present to burn the methane. In our analysis,

we diluted the sample with air and burnt the methane, in estimating it. Dilution with air will raise the oxygen content, and therefore reveal the inflammable nature of one of its constituents. If any ordinary mine air sample contained the same percentage of methane as this sample, it would be highly explosive, but in such cases there is always sufficient oxygen to admit of complete combustion of the methane. The limits of explosibility of methane are from 5.5% to 13%. If the sample submitted is a true sample of the issuing gas, and further evolutions do not exceed this percentage of methane, it is possible of course by proper ventilation to reduce the black damp content to a figure within safety limits, as is the practice in coal mines; for when diluted with very much air the methane percentage of course drops considerably, and although two or three per cent. of methane in mine air is not to be desired as it takes up the place of oxygen, yet an explosion is not possible before 4½ to 5% of methane is present. So dilution of sample with air cannot give an explosive mixture, although it does give an inflammable one.

"We would say in conclusion that most coal mines keep the methane content down below one per cent.; that two or three percent methane is getting to be serious; while, 4 to 4½% is on the limit of explosibility. Also in England, coal mines are forbidden to operate if the oxygen content falls below 19%. In normal air it is 20.93%."

The discovery of this deposit should be of great assistance to engineers in their search for other similar deposits. A careful study of the conditions of the Malagash area may well indicate to those familiar with the Province, other localities where the conditions are similar and where surface prospecting and drilling might offer a reasonable chance of obtaining results.

4. Markets.

a. Domestic.

The importance of this discovery to Canada and more especially to the Maritime Provinces can readily be seen. The only salt producing district in Canada at present is the western Ontario district. Thus Canada at the present time imports over half of her annual consumption. The calculated consumption of salt in Canada in 1918 was 296,328 tons* valued at $2,535,465 as compared with a consumption in 1917 of 301,076 tons valued at $2,041,633. The total sales in 1918 were 131,727 tons, valued at $1,285,039. Of this only some 893 tons valued at $16,743 were exported. There is thus an opportunity for a considerable domestic market for salt to replace the imported material. This import of salt in 1918 amounted to 165,494 tons, valued at $1,267,169 and included: 51,450 tons of fine salt in bulk valued at $294,676; 13,941 tons of salt in packages, valued at $156,736; and 100,103 tons imported imported for the use of fisheries and valued at $815,757. This last item is employed either on the Atlantic or Pacific seaboards in the fishing industry. From a study of the trade statistics of the Customs and Trade and Commerce Departments, I think it is safe to say that about 75% of this fisheries salt is utilized on the Atlantic seaboard including the Gulf of St. Lawrence. The average value of this salt at point of shipment for 1918 was approximately $8.15 per ton of 2000 lbs. The ocean freight rate to bring this salt to Canadian ports of distribution would bring the cost up to at least $10.00 per ton.

This price will probably be a normal price for salt for fisheries for a number of years to come — the price during war time ranging between $15.00 and $25.00 per ton selling price at selling points in Nova Scotia. If, therefore, a deposit of salt can be developed in a centrally located point in Nova Scotia, and a grade of salt produced suitable for the fishing industry a market of some 75,000 tons, valued at $750,000, is available.

In addition to this a considerable demand for salt for domestic uses in the Maritime Provinces could be supplied from such a deposit.

b. Foreign.

Among the foreign markets for the salt from the Malagash deposit the principal ones will be the fishing industry industry of Newfoundland, which consumes, according to reports, about 50,000 tons per year and the fishing and metallurgical industries along the Atlantic seaboard of the United States. It will remain to be seen how much of this latter market can be captured by material produced in Canada.

One feature with relation to the Malagash deposit which is well worthy of serious consideration for future action is the possibility of establishing an industry for the manufacture of sodium compounds. It may well be that, situated as this deposit is, with ready access to shipping facilities both by rail and water, and comparatively close to abundant supplies of fuel, an industry using the salt from these beds as the principal raw material, could be established which would turn out products at a price which could compete in foreign markets such as South America and South Africa with similar material from the English and United States plants.

It will thus be seen that, although the Canadian market alone for salt, or the associated chemical industries, for material produced at this deposit would guarantee its success, its favorable location to water transportation on the Atlantic seaboard will also likely enable it to develop an export trade with the United States, South Africa and South America.

*Figures given in this section are taken from Preliminary Report of the Mineral Production of Canada, 1918. John McLeish, B.A., Mines Branch, Dept. of Mines, Ottawa. No. 506.

Concentrating Mills at Galena Farm Mine Again Operating.

The concentrating mill at the Galena Farm Mine is in operation again and the mine management looks for a steady season's run. A general meeting of the Lucky Jim Mining Company's shareholders will be held at Victoria, B.C., on May 1st. R. O. Whitaker, the American smelting and metallurgical expert, has arrived at Nelson, B.C., to assist in the preparation of a report on the custom rates charged by the Consolidated Mining & Smelting Co. of Canada at its Trail Smeltery. Charles F. Coldwell, prominent Slocan mining operator, who has acquired an interest in properties of the Stewart District, Northwest British Columbia, is in Ottawa with a view to interesting the Federal Government in the construction of a railway from the head of Lynn Canal through the Stewart River section. He is enthusiastic in his predictions of the future importance of this district from the viewpoint of the mining industry.

BEATTY TOWNSHIP GOLD DEPOSITS.

We are advised that arrangements are being made to develop the property of the Cartwright Gold Fields, Ltd., at Painkiller lake, Beatty township. The property has been idle since the buildings were destroyed by fire in 1916. The plant included a 5 drill compressor, hoist and two 60 h.p. boilers. At the time of the fire a 10 stamp mill was on the property. It is said that the machinery can be used again, a comparatively small sum being necessary to put it in good working order.

A shaft has been sunk 100 ft. and about 50 ft. drifting done at that level. It is planned to sink to 400 ft. This work is on the South Claims. On the North Claims exploration will be by diamond drilling, for which tenders are now being asked.

These properties are in the Beatty-Munro area described by Mr. P. E. Hopkins in the 1915 report of the Ontario Bureau of Mines. Claims were staked for gold in Beatty and Munro townships in 1908. Mr. A. G. Burrows mapped Munro township and a portion of Guibord in 1911. Mr. Hopkins mapped Beatty and parts of Warden and Coulson in 1914. The two maps, embracing about 150 square miles, have been incorporated and published as a geologically colored map on the scale of one mile to the inch.

Mr. Hopkins says of the deposits examined: "The gold veins are small and belong to the pyritic-gold type, with transitions to the arsenical type. The study of the veins in the vicinity of Painkiller lake, shows the presence of considerable tellurides associated with the gold. These veins resemble the small gold telluride veins of Kirkland Lake."

"Tellurides were recognized in several small gold-bearing quartz veins in the vicinity of Painkiller lake, on lots 8 and 9, concession V, Beatty township, and on lots 6, 7 and 9, concession VI, of the same township. No doubt they occur and will be found elsewhere in the vicinity. The best telluride specimens were obtained from No. 1 vein on the Treadwell property, lot 9, concession VI, Beatty township.

"Owing to the tellurides being in very fine grains and in close association with the gold, it is difficult to identify them. These minerals occur in fractures in the quartz with grains and seams of gold through them. Certain polished surfaces of the tellurides were examined under a miscroscope with reflected light, special attention being paid to the slight variation in color and the effect after adding a drop of nitric acid. Most of the tellurides have a creamy-white color and after the addition of a drop of HNO_3, turn brown and effervesce strongly, leaving a characteristic etching resembling that of calaverite. There are small amounts of another telluride, light grey in color, which were found to contain bismuth."

Of the Cartwright proper Mr. Hopkins said in his report:

"The Cartwright Gold Fields, Limited, have their main workings on the south shore of Painkiller lake on lot 8, concession V, Beatty. The small quartz vein carrying visible gold, telluride and pyrite runs northward into the lake. A shaft is down 100 feet and work is being carried on at the present time (May, 1915). The old plant and buildings were burned in 1913. The new plant consists of a 3-drill compressor, hoist, and two 60-h.p. boilers. All the machinery in connection with a 10-stamp mill is on the ground and being erected."

In concluding his report on the area Mr. Hopkins said:

"The Beatty-Munro gold area is one worthy of more systematic prospecting. The veins so far found are mostly small, but thorough prospecting may reveal wider and richer ones. Several samples assayed showed the gold to be widely distributed. The veins in the vicinity of southwest Munro are of the Porcupine type, while those at Painkiller lake closely resemble the gold-telluride veins at Kingland lake. The finding of so many gold-telluride veins in the immediate vicinity, viz., Kirkland lake, Maisonville and Grenfell townships, Opasatika lake, Painkiller lake and Deloro township, shows that the gold-telluride minerals are widely distributed, and by further searching larger and richer deposits are likely to be found."

Now that the war is over we may see exploration of this area carried out as recommended.

Mountain Chief Copper Mine.

The Mountain Chief Copper Mine at Renata, B. C., is another property which is expected to be on the producing list shortly. J. W. Evans, president of the company, states that a new tramway has almost been completed and that other equipment will be ready for operation at an early date. Mr. Evans expects that a daily output of forty tons of copper ore will be maintained after a start is made.

Flotation Plant at Granite Mill.

The Eureka Mines, Ltd., operating the Eureka, one of the well-known copper producers of the Nelson District, will have their flotation plant installed at the Granite Mill in a short time. The stamp mill has received an overhauling and the flotation plant is now in Nelson ready to be transported to the property.

Alamo Claims Bonded.

The Alamo Group of six claims on Wolfe Creek, adjoining the Queen Mines, on which important development work is being done by A. W. McCune and associates, has been bonded by eastern interests for $40,000. G. R. B. Elliott put the deal through on the latter's behalf. Mr. Elliott has been investigating the properties for some weeks and seems optimistic as to their possibilities.

Wage Reduction at Rock Candy Mine.

The reduction of 50 cents a day in the wages of miners has resulted in a partial strike at the Rock Candy Mine of the Consolidated Mining & Smelting Co. near Grand Forks. Twenty-nine of thirty-five men left their work shortly after the announcement was made. No more men will be employed at present pending the completion of the concentrator. The grading of the extension of the railway from Lynch Creek to the Mill has been finished and the roadbed is ready for steel.

Developing Property at Arrow Lake.

A large deposit of zinc ore with some showings of galena is situated at Pingston Creek, about twelve miles south of Arrowhead. Further north is a promising copper property. A wagon-road has been constructed to these properties, and considerable development done with encouraging results. The Reneta, a copper property on the Lower Arrow Lake, is again under development on a new bond, on which the first payment of $15,000 has been made.

BELMONT SURF INLET GOLD MINE.

General manager Frederick Bradshaw, of the Tonopah Belmont Development Co., in his report to president Clyde A. Heller, says of the Surf Inlet mine: "The operation of the property of the Belmont Surf Inlet Mines, Ltd., which had been started six months previously, continued throughout the period (10 months ending Dec. 31, 1918), under conditions that were particularly arduous on the gold mining industry. The scarcity of all labor, and especially of skilled mine labor; the higher wages paid and the decreased efficiency of labor; the increased cost of, and in some instances the impossibility of securing supplies, with no advance in the price received for the gold produced, greatly increased the operating cost and decreased the earnings. Notwithstanding these conditions, the Surf Inlet property became the leading producer of gold in British Columbia and the operations for the ten months period, from the treatment of 83,142 tons of ore, resulted in net earnings from operations of $323,242."

The directors of Belmon Surf Inlet Mines, Ltd., are: E. A. Cleveland, Vancouver; M. B. Cutter, Minneapolis; Jos. C. Fraley, Philadelphia; Clyde A. Heller, Philadelphia; Richard G. Park, West Chester, Pa.; Wm. M. Potts, Wyebrook, Pa.; S. Deas Sinkler, Philadelphia; Thomas W. Synnott, Wenonah, N.J., and C. Berkeley Taylor, Philadelphia. C. A. Heller is president; Wm. A. Potts, vice-president and S. D. Sinkler 2nd vice-president, J. K. Kitto is secretary-treasurer. At Surf Inlet F. W. Holler is superintendent, E. W. Hawkins auditor, F. H. Pennlas mill superintendent, and H. J. O'Connell mine superintendent.

President Heller under date of March 26, 1919, says that $45,569 was expended last year for houses for staff employees, school-house, retail store and warehouse, etc. During this year several more cottages for employees, a hospital building and a slight extension of the railroad will be necessary. There was spent last year on development of the Pageley mine, held under option, $7,646, the conditions being unfavorable for progress. A renewal of the option is expected.

General manager Frederick Hawkins says in his report on operations during the 10 months ending Dec. 31, 1918, that the 83,142 tons of ore milled during the 10 months period had a gross content of 39,999 ounces gold, 25,893 ounces silver and 433,399 pounds copper and a gross value, calculating gold at $20 oz., silver at $1.01⅛ and copper at 22,661 per lb., of $924,847. Average value per ton ore was $11.12.

Ore reserves March 1, 1919, were estimated at 385,320 tons. Since then 116,349 tons has been mined, but the reserves increased to 422,761 tons, positive and probable ore.

Mine, mill and power plant operations have proven to be satisfactorily efficient and the improved conditions should soon be reflected in the cost sheets.

Martin Gold Mine.

The shaft on the property of the Martin Gold Mining Company's property, near Amos, Quebec, on the National Transcontinental Railway, having reached a depth of 125 feet, cross-cutting has been carried out and the vein encountered about ten feet from the shaft. At this point the vein is said to be about 13 feet in width, and contains visible gold.

A Montreal syndicate is negotiating with a view to purchasing control of the company.

Reduction of Wages at Trail.

A further reduction in the wage scale paid by the Consolidated Mining & Smelting Company is announced in a recent circular which reads:

Trail, B.C., April 12, 1919.

To the employees:

The average price of copper for the month of March was 14.84c., consequently the wages in the copper mines will be reduced 50 cents per man per day. As arranged in the smelter scale a 25 cent raise was given on July 1st, 1916, which was to remain in force until the mines scales were reduced owing to a drop in the price of metals, and then was to be reduced by an equal amount of one-half of the reduction made at the mines.

On April 15th, 1919, the copper scale will be reduced 50 cents per day, which will call for a reduction of 25 cents at the smelter. It is recognized by the company that the cost of living is still high and, therefore, for the present, at least, the minimum wages will be held at $3.50 per day with the exception of boys and apprentices.

The company has been forced to carry an ever increasing stock of unsold metals, so much so in fact that were it not that many of our employees have voluntarily increased their efficiency we would have been forced to close them.

In recognition of that effort of our employees, while forced to make some of the reduction called for in the wage scale, we will make further efforts to try and finance the production of these metals. We must, however, remind our men that only their best co-operation will make it possible for us to continue operating for any length of time.

Thanking you for your increased effort and trusting that you will give even further co-operation and so enable us to keep the plant in operation till the present critical period is past,

Yours truly,

(Sgd.) S. G. BLAYLOCK,

Assistant General Manager.

Aeroplanes Will Help Prospector.

Discussing the possibilities of the aeroplane in connection with the development of the mineral resources of British Columbia, Captain Alfred Eckley, R.A.F., in a recent address delivered at Vancouver, B.C., said: "The prospector of the future will not spend weeks and months toiling through lofty passes and over forest trails to the distant fields where he proposes to win fortune. He will load himself and his six months grub into an aeroplane, fly over the ranges and land on the spot he has selected. When the season is over the airplane will call again, pick him up along with such ore samples or gold dust he has secured, and carry him back to the Vancouver Chamber of Mines where he can display the results of his work. When he is ready to return with machinery and men the airplane again will be at his service. He need not wait for the government to build roads in order to transport his supplies and plant. The airplane that was designed to carry bombs by the ton to Berlin will be found quite capable of delivering comparatively heavy machinery. It also will bring out ore, for it will pay to transport high-grade stuff 500 miles by air. Thus the development of the airplane in British Columbia becomes the key to the exploration and exploitation of the rich mining deposits of the interior districts, which have scarcely been seen as yet by white men."

Special Correspondence

ONTARIO'S UNDEVELOPED IRON RANGES.

To the Editor Canadian Mining Journal:

Sir,—In your publication dated April 2, 1919, there was an interesting article by Jas. W. Moffat on the treatment of Canadian iron ores, especially those of low grade. This article was both timely and of great importance to the industry.

A portion of this article gave a description of the known iron orebodies in Canada. Among these, the larger orebodies are given as the Helen and Magpie mines of the Algoma Steel Corp.; Atikokan mine, of the Atikokan Iron Co.; the Moose Mountain mine, of the Moose Mountain Co., Ltd. The other orebodies in the older, more populous parts of Canada are mentioned as not being large and of low grade as a rule. A statement was also made that with the exception of the mines mentioned, no really large property has been thoroughly proven to contain one million tons of marketable ore.

In connection with the above statement, if the use of the term marketable ore is applied to the Moose Mountain mine, which is almost entirely a concentrating proposition but turning out a valuable high grade product, the same term should apply and the same allowance as reserves should be made to other large orebodies of a similar nature in Western Ontario. Also the statement that the Atikokan mine of the Atikokan Iron Company, represents the only large proven orebody of this district is, to say the least, misleading, though the additional high grade tonnage is mainly on the range of that name, but held by other mine owners.

On my own explorations, which extend over a period of nearly twenty years and which was given almost exclusively to the study of the Canadian Iron Ranges, I have visited personally over one thousand lineal miles of iron ranges in western Ontario alone, independent of Michipicoten, Magpie, or Moore, Mt., all within rail haulage distance of lake freight as well as being conveniently near existing railway lines. I know of the whereabouts of another thousand miles that would be considered as future reserves of the Dominion, but are at present, too distant from railway transportation.

In the whole of these explorations, while I have found but few large outcroppings of shipping ore, I would consider that in the first thousand miles of ranges there were at least one hundred miles which were worthy of being given the much closer examination which would precede diamond drilling. Outside of this there were large areas which can well be taken into consideration as concentrating propositions.

From west to east the most important iron ranges occur tributary to the Head of Lake Superior,—Steep Rock, Atikokan, Mattawan, Kaministiquia, Loon Lake, Nipigon and Little Long Lake. Less explored ranges are, Hunter's Island, Little Pine Lake, Onamon River and a number of others which extend east from Thunder Bay for a distance of over two hundred miles.

The following tonnages are based on my own surveys and the estimates furnished me by engineers engaged in drill work and other development on the different ranges;

West of Sabawe Lake,—Atikokan Iron Range, 15,000,000 tons, average 55% Iron, 13% Sulph. .03% Phos.

East of Sabawe Lake, Atikokan Iron Co. Mine 10,000,000 tons running 55% Iron, 2% Sulph. .10% Phos.

The Mattawan and Kaministiquia ranges — banded iron formation (Jaspilites) running from 35 to 40% of Iron, 150,000,000 tons which might be concentrated.

Loon Lake Iron Range is estimated as having a total tonnage of 25,000,000 tons.

In addition to the above, on the Mattawan Range there are great tonnage of massive low grade hematite which would be useful in any local furnaces as a mixing ore, running from 35% to 40%.

A considerable proportion of the Loon Lake Ore when hand sorted, would make a shipping, merchantable product, while the lower grades of more massive ores, of which there is a large tonnage on that range, would be well adapted for a local furnace supply.

Extensive tests have been made of the higher sulphur ores on the Atikakon, which gave splendid results. A shipment for experimental purposes, of 400 tons was made and roasted in Wedge furnaces. The analysis of the ore before treatment was 59.34 Iron; .02 Phos.; 2.85 Silica; 21.44 Sulph. After roasting this gave the following product: Iron 65.53; Phos. .02; Silica 3.44; sulph. .59. This test was made from the ores carrying the highest sulphur content on the range, while there is a large tonnage that will run in the neighborhood of 2% in sulphur included in the reserves of the range.

On the Steep Rock Range, which is the thickest and most extensive in that particular district, a small amount of drilling was done at Straw Hat Lake which disclosed a body of hematite of merchantable grade, but as very little work was done on this deposit, estimates are not available.

On the Kaministiquia Range, I recently made a survey of a single outcropping of proven depth which contained over 14,000,000 tons which could be open cut, without taking into consideration a very large tonnage on the same property which would have to be mined. A Government test taken from the outcropping mentioned, of crude ore, the sample weighing about 250 lb. when treated for concentration by jig and water separation and breaking only to quarter inch mesh, gave the following results;

Analysis of crude ore .. ..37.19 Fe.
Ratio of concentration 1-2
Analysis product .. ..53.25 Fe.

A number of hand tests gave an average of 52.96Fe. .09 Phos. and .08 Sulphur from crude ore averaging 33.61 Fe. It is a banded magnetite-hemetite. This ore shews by analysis as follows:

Total Iron 37.19%
Hematite.....Fe_2O_3.....17.19%
Magnetite.....Fe_3O_4.....33.97%

When we consider a proposition of this kind with a 25 mile rail haul and situated immediately on the tracks of two railways, and developed electric power within 6 miles, the advantages this would have over magnetic concentration requiring fine grinding briquetting and a more expensive plant, are evident. In addition to the open cut tonnage already given and the other ore reserves on the same property, we have, within a radius of five miles, the remainder of the 150,000,000 tons mentioned in the tonnage reserves of this

district. This tonnage is easily within the mark.

In the eastern portion of Thunder Bay district, a very small amount of drilling was done on the Onaman River and Nipigon District where there are very extensive iron ranges of great thickness without considering the Little Long Lake range which is of equal importance.

In summing up these ore reserves which are practically on the railway tracks and easily within the limit of haul by rail, it would seem that eastern men in compiling statistics, etc., have practically shelved this district altogether. In my opinion, it is really the most important point in Canada as regards iron ore reserves.

In the New York Mining and Engineering Journal dated June 22, 1918, they published an estimate of the iron ore reserves of the world. This statement gave Canada as follows: "**Not estimated, scattered and relatively small.**" Is not this a splendid advertisement for our iron ore reserves? Many of our Canadian engineers and our Mines Department men seem to be imbued with much the same idea.

While it is true that the Nova Scotia Iron and Steel companies can get unlimited supplies of ore from Wabana, N.F., other steel plants or smelters are dependent on account of the shipping distance, on other reserves.

I quite agree with Mr. Moffat in his statement that it is much easier for the Canadian furnaces to simply write any iron company in the United States where they can get any grade or class of ore desired, be sure of its prompt delivery and of its being according to the analysis guaranteed them when making their selection. They also only pay a duty of eight cents per ton and no war tax, while the local producer of ore would have to sell on the same market basis, but would pay a war tax. This might not seem patriotic on the part of the furnace man, but it is business.

On looking over the iron and steel production pamphlet issued by the Government, the following figures are very interesting:

In 1912 we imported from the United States alone, $82,658,294. worth of Iron and Steel Products;

In 1913,—$106,610,390.;

In 1914,—$76,702,283.;

In 1915,—one of the quietest trade years that Canada, had for a decade, $48,411,020.

Making a total for the 4 years of $314,381,987.—an average of over $78,000,000 annually.

That none of this was required for war products was evinced by the import from the United States in 1916, the first year that Canada actually started dealing largely in munitions, in that year we imported $95-165,875. This gradually increased until it amounted to over $150,000,000. These are staggering figures and in, as Mr. Moffat expressed it, what the Canadians point to proudly, as their growing years.

I do not know what the import will be for 1919. but we notice statements in the papers that the various Canadian steel plants are going to the Government soliciting orders. Why have they not taken care of some of this huge import in past years? Are they taking any steps to manufacture this import in future years? It seems very doubtful. They seem content to run along turning out standard grades in classes of material for which they probably require less elaborate machinery and a smaller plant than to cater to what might be termed, mixed trade, which is much the same reason why the Canadian furnace owners buy American ore, that is — a matter of convenience.

In 1916, of twenty furnaces in Canada, only fourteen were in blast for varying periods of time, yet in the years 1913, 1914, 1915, 1916, we imported from the United States, $5,496,639. worth of pig Iron. There is practically no production of structural steel in Canada and only a very small tonnage of plates. In accordance with this program, the blast furnaces and steel plants of Canada have an annual output of about $100,000,000 and we have an annual import of iron and steel products of over $78,000,000. Surely there is some remedy for this!

Very few of the Canadian blast furnace owners have made any special effort to get a supply of Canadian ore, at least as far as the Thunder Bay District is concerned. It is quite true that they need various grades which they can purchase quite easily in the American Market, also that the Canadian output might not all be quite up to their requirements, and that they would still have to import a small percentage, but there is no necessity for importing over 90%.

I might add that the Government tried the plan of paying a bonus on pigiron produced in Canada with the result that as the operator of the mines did not get any encouragement there were no new mines opened up and the furnaces imported their ore from the United States and collected the bonus.

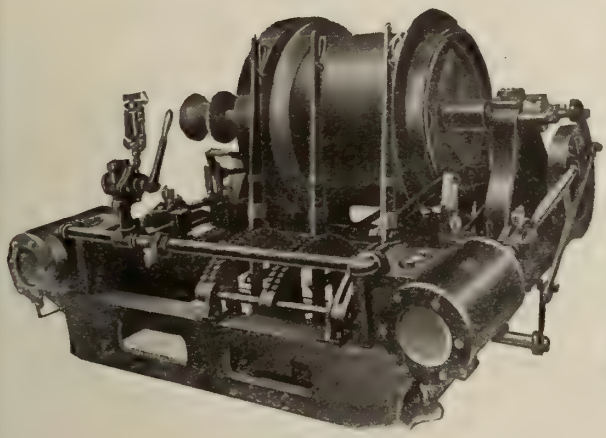
In connection with our iron fields, the work done by the U. S. Steel on the Atikokan Iron Range was the largest amount of drilling in any one section in Canada, and in the whole of the Thunder Bay District this work would represent more than nine-tenths of the drilling done. There has not been even a close, detailed survey made of our iron ranges by Government engineers, or engineers representing outside interests except on the Atikokan Range.

The principal reason why few large iron orebodies have been found is that no one has taken the trouble to explore for them. This would necessarily mean a very expensive survey followed by a certain amount of surface and a very considerable amount of diamond drill work, and it stands to reason that neither the explorer nor the average owner can afford to do this and here I am speaking from experience. Until some special inducements are offered or Canadian furnaces and steel plants go after a supply of their own, there is little likelihood of the Canadian iron and steel industry, which should be the most important individual industry in Canada, making any great strides.

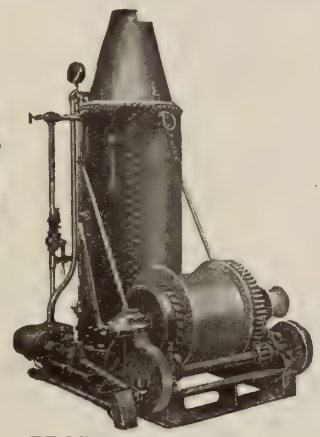
The Federal Government is now being asked to give a bounty on iron ores produced in Canada, said bounty to be paid to the operator of the mine. Almost the only adverse criticism seems to be the amount of money that the Government might be called upon to pay out for this purpose. In connection with this I would point out that the average market value of iron ore at present prices, Lower Lake Ports, is nearly $5. per ton. This would be about $4. f.o.b. at the Head of the Lake Superior, which would mean that if 50c per ton bounty were granted, eight times that amount would be spent in Canadian territory in opening up iron ranges and the Government would actually receive back manifold in taxes, etc. what they paid out, besides gaining enormously in increased traffic for the Canadian National Railways which tap 75% of the Thunder Bay and Rainy River District iron ranges, and the hundreds of miles of ranges which we have within easy shipping distance would be carefully looked over and diamond drilled. From my personal observation I feel quite

MINE HOISTS STEAM, ELECTRIC OR BELT POWER Any Size to 50 H.P.

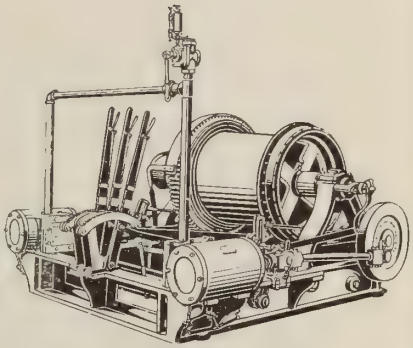
Built to Suit You and Your Work



REVERSING HOIST
With Low Piping Levers, etc.

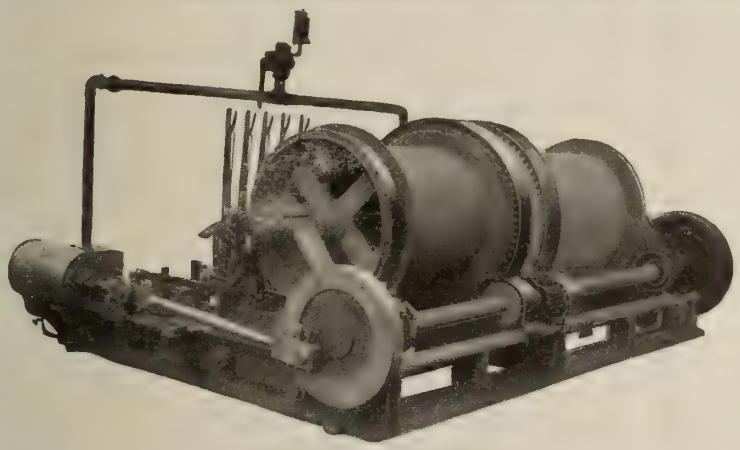


PROSPECTOR'S HOIST, WITH BOILER.

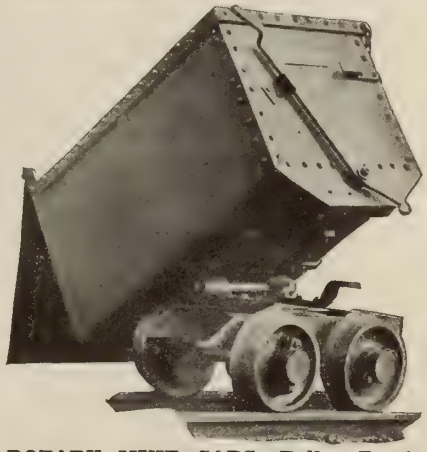


REVERSING HOIST
With High Piping Levers, etc.

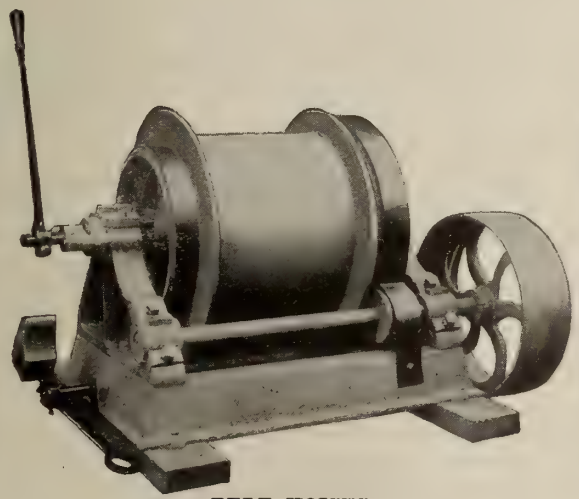
Any of these Hoists made in 7 sizes, from 10 to 50 H.P. and with any diameter drum up to 48".



TWO DRUM HOIST
Made in 7 sizes, from 10 to 50 H.P., and with any diameter Drum up to 48 ins.
Also made for Electric Power.

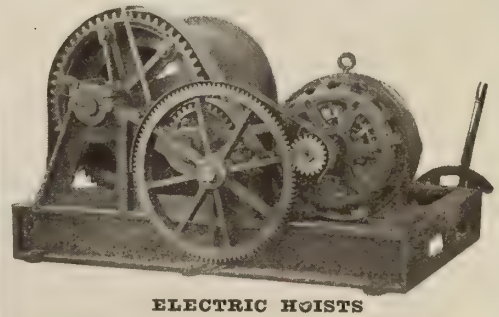


ROTARY MINE CARS: Roller Bearing
Will dump at either side or end.
Made in a large range of sizes and capacities.
We also make any other style of small car required by the customer.



BELT HOISTS,
Made in the same large range of sizes as the Steam and Electric Hoists.

Safety MINE CAGES
made to your liking, and to fit your shaft.



ELECTRIC HOISTS
Made with either Fixed or Loose Drums. Hoist above illustrated has Fixed Drum, Intermediate Gears, and extended base with motor.

We make Electric Hoists any size you want up to 50 H. P., and with either One Drum or Two Drums, Gearing, etc., arranged to suit the work.

Our New Mining Catalogue is just off the press. May we send you a copy?

MARSH ENGINEERING WORKS, LIMITED, Established 1846 **BELLEVILLE, Ontario, Canada**

Sales Agents: MUSSENS LIMITED, Montreal, Toronto, Winnipeg, and Vancouver

safe in making the statement that many of these ranges are quite likely to produce great tonnages of iron ore. Even this program would only partially meet the great deficiency.

Duluth solved the problem for the Western States iron and steel supply by building a $25,000,000 plant, which last year they had to increase to $40,000,000 to meet the demand. American iron and steel purchasing agents inform me that Duluth can shade Pittsburg prices. Local purchasers of heavy steel also inform me that if they could buy their material at the Head of the Lakes, they would save at least 8% on freight charges alone, even if purchased in Duluth or Sault Ste. Marie and the saving in freight charges from Eastern plants would be at least 20%.

Our steel plants must be enlarged to meet the requirements of a growing country and do away with the tremendous import in iron and steel products and the necessary tax which the community pays in duties, etc.

The policy of the men who are doing such splendid work for re-construction, headed by Sir John Willison, is the building up of Industrial Canada. Many of the war workers and also men who went overseas, have become trained mechanics. The result of this policy of re-construction would be to keep these men where they belong, in Canada, and not have them leave for points in the United States or elsewhere to find work for which they have been specially fitted and trained. The returned soldier should have the first consideration by giving him remunerative employment as well as keeping him at home. The average wage paid by the U.S. Steel Corporation is about $4.10 per day. This item alone and the immense import of iron and steel products, is sufficient argument for adding nearly 75% to the capacity of the steel plants of Canada.

A steel plant at the Canadian Head of the Great Lakes would solve the problem for the whole of western Canada, for we must consider that while the population of Ontario and Quebec in increasing very slowly, the population of the Great West is increasing by leaps and bounds and there is room for many more millions to be added to the Western Provinces. The proven iron ore reserves of the Thunder Bay district alone with its various grades, would supply a plant of any size for any number of years.

Even Government aid in the payment of a small interest on the actual expenditure would be a splendid investment.

It has been pointed out by various men that the Government would be entering into competition with private enterprise; but as an absolute offset to this statement is the fact that the Port Arhur Shipbuilding and Dry Dock Company and others draw from 3% to 3½% on a large portion of the investment for terms varying from 20 to 25 years from the Government. Moreover the steel plants in the east were heavily subsidized in the past. Why not assist the establishment of an iron industry at the Head of the Lakes to supply the present and ever increasing demands of the west, at a great saving in freight alone on any iron and steel products that could be brought in by either rail or water?

We can always get coal delivered at the Head of the lakes at a freight charge of 50c per ton or less, so the fuel problem, as connected with smelters or steel plants, is easily solved. The great Hydro electric development in the Thunder Bay District answers all questions regarding power.

Yours, etc.,

J. E. MARKS.

Port Arthur, Ont.

Governmental Exploration for Mineral Deposits.

With regard to a scheme for governmental exploration for mineral deposits, as has been recently suggested by the secretary of the Canadian Mining Institute, there will probable be many difficulties to be encountered should such a plan be adopted.

The prospecting fraternity is made up of a type of men who may always be willing to listen to the suggestions of mining engineers, but, perhaps fortunately, do not accept such opinion as being conclusive or infallible. The average prospector would perhaps smile broadly at the suggestion, that when placing his discovery post, he should receive his instructions from a mining engineer. Among prospectors it is a generally accepted belief that mining engineers are not a success in the prospecting field. This does not infer that all due respect is not accorded the mining engineer in his capacity of being able to efficiently conduct the affairs of mining operations and systematize his efforts in endeavoring to arrive at the merits of discoveries made. But it does mean that mining engineers by the wholesale passed the Kirkland Lake area up as being worthless, many of them turned their backs upon Porcupine, as well as Cobalt and Boston Creek, and for this reason the prospectors seem justified in being guided in a large measure by their own judgment.

Geologists and mining engineers have performed genuine service in this country, in that they are able to point out areas where the geological conditions are favorable, and where certain mineral is liable to occur. Beyond this point, the prospectors have led the way. By sheer optimism—sometimes referred to as almost blind optimism, they have won out. A noteable instance of this kind is shown in concrete form in the rich Lake Shore mine where the optimism of Harry Oakes, former prospector and now president of the Lake Shore Mines, placed his every dollar and won success.

The writer is of opinion that the suggested scheme would not prove to be a success. Nevertheless, unless or until some such a scheme should receive a fair trial it would be very unfair to condemn it at this time. A careful experiment of the nature might not be remiss, as it would at once have the commendable advantage of affording employment for returned men and would determine the merits of such a plan. In the meantime prospecting along the usual lines by individual prospectors would not be interrupted.

Electric Haulage at Crown Reserve Mine.

The electric haulage system recently installed at the Crown Reserve mine is working satisfactorily, according to official information. As a result, the efficiency of underground operations has been increased considerably.

Although the electric haulage system has been in practice for several years at the Hollinger Consolidated, and for more than a year at the McIntyre-Porcupine, the present installation at the Crown Reserves is the first of its kind in the Cobalt mines.

Post Free (Inland), 20/6. Post Free (Abroad), 21/6

1,000 pages. In Demy 8vo, bound in RED Cloth

A Recognized Indispensable Work of Reference

For MINING INVESTORS,
MINING ENGINEERS, MINE MANAGERS,
BANKERS, STOCKBROKERS, SOLICITORS,
or anyone interested in the MINING INDUSTRY

A RECORD OF INFORMATION concerning **1,170** Mining Companies operating in all parts of the world. Gold, Diamond, Silver, Copper, Tin, Iron and other Mines, Collieries, Exploration, and Mining Investment Companies arranged in alphabetical order.

PARTICULARS given of each Company include the Directors and other officials, date of establishment, seat of operations, description of the property, with the purchase consideration, plant erected or in course of erection, present working results, ore reserves, details of capital, calls, dividends paid, and the financial position as disclosed by the latest accounts. Highest and lowest prices of the shares for the last four years, also latest price.

Directors (3,150) and Mining and Consulting **Engineers** and **Mine Managers** (865), their addresses and names of the Companies with which they are connected.

SUPPLEMENTARY INDEX of private, dormant or Companies which have ceased to be of public or market interest. One of the most useful and important features of the book. It is the only list of its kind published.

CRUSHING TABLES and Gold Outputs from the principal mines are given at the commencement of the volume, showing tons treated monthly, results obtained, and yield per ton; also annual yields.

DICTIONARY OF MINING TERMS.—An up-to-date glossary covering 440 mining terms by the use of which mining developments can eosily be followed. The difficulty of understanding technical phraseology is thus easily mastered.

To be **obtained** from all Booksellers, or direct from the Publishers.

Oxy-Acetylene Welding and Cutting

For Repairs or Construction Work

This illustration shows an operator welding a metal window sash by the Prest-O-Lite process of oxy-acetylene welding. Railroads, Mines, Factories and Machine Shops everywhere have adopted this process for repairing or construction work, and are saving hundreds of thousands of dollars annually.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones. Provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe, automatic regulators and gauges and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the process quckly and easily.

Write for valuable illustrated literature and data on work others are doing by the Prest-O-Lite Welding Process. It may point out ways to solve your problems.

World's Largest Makers of Dissolved Acetylene

Temiskaming and Hudson Bay.

The Temiskaming and Hudson Bay Mining Company, the first mining company to take up holdings in the Cobalt silver camp is surrendering its charter.

The company was incorporated by a number of New Liskeard men, prior to the discovery of silver in Cobalt. With an authorized capital of but $25,000 divided into 25,000 shares, and with only 7,761 shares issued, the T. & H. B. Co. has established a dividend record that probably exceeds that of any other precious metal mining company in the world. From the sale of the old Silver Queen mine, part of its holdings, it was able to disburse a first dividend of 200 per cent. on November 6th, 1905. This was the first dividend declared by any company operating in Cobalt. The subsequent successful operation of the principal holding resulted in dividends of about twenty-five thousand per cent. being paid to shareholders. Whereas at the beginning, the shares of this company are said to have changed hands at a few cents per share, they ultimately rose to around $300 a share.

In 1909 the Hudson Bay Mining Company was formed with an authorized capital of $3,500,000, as operating company, and the T. & H. P. B. Co., became the holding company. The surrender of the charter of the latter concludes the plan decided upon several years ago.

Dome Mill.

According to official information, the mill of the Dome Mines did not resume operations during the last week in April as had been hoped. It has been found that the resumption of milling operations following a period of eighteen months idleness is a task entailing much more labor than had been expected. However, within the next week or ten days the mill should be running at a moderate rate.

It is learned that very little difficulty is being experienced in securing the desired technical staff and everything points toward the probability of a rapidly increasing output following the actual commencement of milling operations.

Porcupine-Keora.

Diamond drill hole No. 6 is being started on the property of the Porcupine-Keora, situated in the northern part of the township of Whitney.

During the course of the large amount of drilling done on the property, very encouraging results have been encountered.

The Kirkland Road.

Concerning statements being made with regard to the controversy relative to the best method of transportation to the mines of Kirkland Lake, it is erroneous to say that the mines supporting the motor road propaganda in preference to a steam railway are those already equipped with mills. Indeed, one of the strongest advocates of a motor road is the Wright-Hargreaves which company has the largest construction program before it of any of the mines in the field.

The advocates of a steam railroad, for some reason or other, are composed chiefly of holders of outlying or perhaps undeveloped claims, and who are not in a position to weigh the merits of the case with equal ability as are those who are at the present moment actually faced with the problem of finding the most efficient solution.

North Dome.

Concerning reports from Porcupine that an American syndicate, composed of Buffalo interests, has acquired the North Dome mine, and that occupants of buildings on the property have been notified to vacate by May 1st so as to provide accommodation for employees that are to be engaged at once, nothing official appears to have been given out.

The North Dome was acquired several years ago by the Temiskaming Mining Company of Cobalt, and no intimation of the property having been disposed of to an American syndicate had come to the company's office here, as yet.

The James Bay Survey.

At a time when the Ontario Government is arranging to send a survey party into the James Bay district for the purpose of further looking into the advisability of extending the Temiskaming and Northern Ontario Railway to tidewater, a good deal of interest attaches to the program to be pursued, and much speculation is rife as regards the probable personnel of the expendition. The survey will be one of the most important ever conducted in Northern Ontario, and it is considered probable men well versed in the North in its untamed condition will be chosen for the work. On a matter of this kind it would be exceedingly easy to perpetrate irreparable blunder if such a task were to be committeed to men not armed with thorough and proven experience.

In that wild world of territory practically unexplored, conditions will be met that might well dampen the spirit of a tenderfoot. Muskegs, mosquitoes and blackflies, loneliness, inclement weather and a dozen other things incidental to the trip will all operate as factors contributory to discouragement.

It has taken a full century to tame a narrow fringe of Northern Ontario. The balance will not be mastered in a day. And so, on the eve of the departure of the vanguard of those commissioned to take this first important step in the search for a highway to the northern seas, interest in the undertaking, and anxiety over its thoroughness may properly be termed a virtue on the part of citizens of the North, and in no way does it reflect lack of confidence.

Broad as the Northern field already is for new enterprise, the scope thus added by the construction of a railroad through such a territory should present excellent opportunity for big important concerns which are always on the alert for fields which permit free opportunity for expansion.

Canadian Kirkland.

A meeting of the shareholders of the Canadian-Kirkland Gold Mines is to be called at an early date for the purpose of considering, and if approved, ratifying an option agreement whereby control of the company will pass to the Crown Reserve Mining Company.

It is understood the situation is such as to assure no hitch in the transaction, the directors having already agreed and now only await ratification by the shareholders.

The Crown Reserve is already proceeding with arrangements to carry out a comprehensive exploration and development programme. Effort will be centered largely on the development of vein No. 2, which shows a very substantial width, with commercial ore occuring in certain sections.

NOW READY

Canadian Mining Manual

1918

Edited by Reginald E. Hore

Bound in Cloth. Price **$5,** post paid. Bound in Leather, **$7**

360 Pages 290 Illustrations

30 COLORED PLATES

Information concerning all Minerals and Metals Produced in Canada.

Information concerning all Mining Companies Operating in Canada.

The Illustrations include: 30 Colored Plates showing Canadian Ores; Maps of Mineral Areas; Photographs of Mining Plant and Equipment; Photographs of Men connected with the Industry.

Out Of The Rut— After A Week's Use—

I was in a rut on carbide lamps, took it for granted they were all about alike, so continued to buy the kind we had been using.

I happened to see your advertisement—took advantage of your 30 day trial offer. After a week's use I began to realize how much we had been missing, and how much more it was costing us through not using I.T.P. lamp.

I never knew until I used I.T.P. that there was a carbide lamp that would run for a full shift without rechanging, and during that entire shift required no regulation whatsoever. Your I.T.P. is the only lamp that will hold its light in our heavy air currents. Your wind shield does the trick, besides, it protects the burner against the water splashing from the timbers.

Gold Reef.

An examination of the Gold Reef mine is being made, preparatory to carrying out an exploration and development program. It is understood an engineer has been already engaged for the work.

The Gold Reef is situated in the township of Whitney, a short distance north from Porcupine lake. It is about in a direct line between the Dome Mines on the South-west and the Porcupine-Kerro on the north-east. During its early development, some spectacular ore was encountered in a narrow vein.

Dolly Varden Company Reported to Have Admitted Claim of Taylor Co.

Victoria, B.C.—The affairs of the Dolly Varden Mining Company promise to reach a settlement without loss of time. It has been reported authoritatively that the company admits the claim of the Taylor Engineering Company, which amounts to $462,628.

This was expended in the construction of eighteen miles of railway from tidewater in the Alice Arm District, British Columbia, to the Dolly Varden Mine. Payment of the sum must be made to the Engineering Company within thirty days, and it is taken that the admission of the claim is an indication of the Company's readiness to settle within that period. If this is so the title to a good mine as well as to the railroad which taps some of the richest mining country in the Northwest will be cleared, the company will be in a position to sell or to operate, and activity and prosperity should return to the section affected. The Taylor Engineering Company, too, will be able to pay its creditors, among whom are one hundred odd workmen who were engaged on construction and who have been impatiently waiting for their wages.

Government Prospecting in British Columbia.

Charles Camsell, British Columbia representative of the Dominion Geological Survey Department, who has just returned after a two months visit to Ottawa, states that interest never was keener in mining in Canada. The Dominion Department of Mines, he says, appreciates that everything possible should be done to encourage this optimism and one matter which he has under consideration, and which he is supporting, is that prospecting parties be sent into British Columbia territories which indicate the presence of minerals by their location and formation. Upon good strikes being made the Government, according to this proposal, would supply the money for the development work up to the proving point and then the property would be put on the market and the Government reimbursed out of the revenue from the sale. "In this way," Mr. Camsel explains, "many soldiers who have signified their intention of living in the open in preference to returning to offices could be supplied with work of a congenial and healthy nature. At the same time the mineral resources of the province would be developed and the country would receive direct returns for its investment." Even if the Government does not take this step Mr. Camsell predicts that there will be many independent prospectors go to the hills on their own account, prefering the freedom of the mountains to the confinement of clerical duties.

Miner Killed at Harewood Mine.

Henry Clark, a Nanaimo miner, was killed recently by a fall of coal in the Harewood Mine, Canadian Western Fuel Company.

:-: EDITORIAL :-:

PROSPECTING BY RETURNED SOLDIERS.

Returned soldiers are offered financial assistance if they choose to engage in farming. Should not those who prefer mining be given similar assistance?

If it is admitted that the soldier should be allowed to choose for his occupation prospecting for minerals instead of clearing and tilling the soil, it behooves mining men to suggest how such assistance should be given. Obviously, the difficulties are greater in this case than in agriculture; but there must be some satisfactory solution and it will be found if we look for it diligently. The solutions that have been offered are not considered wholly satisfactory, but they are valuable, nevertheless. They should bring out discussion and lead to good results.

One thing that strikes us is that the prospectors have not yet given voice to their opinion regarding assistance to prospectors. We would be not a little surprised if they looked very favorably on some of the plans that have been proposed, in which it is provided that government prospecting parties should be in charge of engineers. It seems to us that the proper persons to place in charge of prospecting parties are experienced prospectors. Mining engineers who have had considerable experience in prospecting would be well qualified for the work, but great engineering ability is not so necessary as well developed powers of observation, and a love for the work. The engineer has his place, and it is a very important place, in the mining industry; but the prospector is generally better qualified than the engineer for his particular work. It is no great discredit to the engineer that he seldom makes discoveries in new fields. It is no discredit to the prospector if he cannot survey a stope or design a hoist.

The prospector can get much assistance from the engineer, and perhaps more from the geologist. It does not necessarily follow, however, that the prospector does not bring to his work any tools of his own. His ability to utilize the work of the geologist and the engineer does not make him a subordinate individual by any means. Why should we assume that there are not among the prospectors men capable of leading prospecting parties?

If the government is to assist prospectors, should there be any strings attached to the title of properties staked while in receipt of such assistance? It seems to us that the fewer restrictions placed on the prospectors the better. We know that there would be objections raised if the prospectors were allowed to have a perfectly free hand. Nevertheless, we are disposed to believe that the best plan would be to give each soldier an outfit, a season's supplies and a little money, and let him go wherever he pleased like any other prospector. Every assistance in the way of advice should be tendered him; but he should not be required to accept it.

It is probable that some recipients of government "grubstakes" would not do good work. There would be some waste, but possibly not as much as a staff of supervisors would cost. In any event, we should remember that we are paying these men for what they have done for the country rather than for what they are going to do. Their own interests will direct most of them to spend a reasonable portion of their time in the search for minerals, provided they are to receive full title to their discoveries. The government, like every individual who puts up money for prospecting, will have no guarantee of returns.

THE UNDERSEA COAL-FIELD OF CAPE BRETON ISLAND.

A very lively interest is being taken throughout Nova Scotia in the legislation now before the House of Assembly in Halifax which is designed to empower the Commissioner of Public Works and Mines "whenever he deems it expedient to inquire into and concerning whether any worked or unworked submarine coal mining area, held under lease and subject to the provisions of the Mines Act, can, if unworked, be advantageously work, or if worked, be more advantageously worked in the best interests of the Province by some other lessee of coal mining areas that are subject to the provisions of the 'Mines Act' and to report thereon to the Governor-in-Council with any recommendation he may think fit."

The attitude of the Government of Nova Scotia toward the submarine coal lease question was indicated during February in a statement made by the Commissioner of Mines to representatives of the Press. Mr. Armstrong said:

"Many of our valuable deposits are under the sea. Obviously, the extent of these measures is difficult to determine. In each of the four well-known coal basins in Cape Breton County, around Sydney Harbor, the various seams dip from the land out under the Atlantic Ocean with wonderful regularity. Many of the mines of The Dominion Coal Company, and of the Scotia, are being operated under the sea, in some instances probably two miles from the shore. When it is known that submarine coal seams are today being successfully extracted at a distance of over five miles from the shore, and as the fringe of our areas is but touched, the possibilities are enormous. The problem of extracting the coal, from an engineering standpoint, is an interesting one. *The key to the development of these areas is naturally dependent upon the contiguous land areas.*

"As the development of these underseas areas proceeds it is becoming apparent that the policy pursued in the past of laying these areas out on the same principle as that applicable to land areas, is open to challenge. Unless arrested and altered, the future development and operation of some of these areas will be difficult and economically impossible. These difficulties were not foreseen at a time when the value of these areas was less appreciated than today. The conservation of these valuable deposits is essential in the public interests, and only the very strongest of reasons should be admitted to prevent the application of a speedy remedy. This applies more directly to the submarine areas off Sydney

Harbor than elsewhere. It may be necessary to review and re-survey this whole territory and re-adjust existing lines and boundaries in such a way as to ensure such a disposition of these areas as will guarantee the future extraction of this coal, upon the most natural, equitable and scientific lines possible. The time has probably arrived for some such action. It can be accomplished, I have no doubt, without inequitably disregarding or unfairly disturbing existing interests or rights."

The necessity for legislative action in this matter has, as is well known, arisen from the application of the Nova Scotia Steel & Coal Company for permission to extend its collieries into the solid coal surrounding the undersea workings, and the objection of the Dominion Coal Company as lessee of the coal in question.

BETTER ROADS FOR MINING CAMPS.

In this week's issue of The Journal, two Government announcements of particular interest to Northern Ontario are made. First, is the announcement that a motor road will be built for the benefit of the mines of the Kirkland Lake field, and, second, that the Government has taken over the ore sampling plant of Campbell and Deyell's, and will operate the plant for the general benefit of mines in the north.

The decision to construct a motor road from Swastika to Kirkland Lake is in compliance with the expressed wishes of the leading property owners in the district. It is believed the cost of the road will approximate $72,000. In the subsequent development of mining properties farther east, should success be achieved, an, also, should the Larder Lake district develop successfully, there would then be much in support of constructing a railway from Swastika to Larder Lake by way of Kirkland Lake. As matters now stand, the proven mines of Kirkland Lake are only from four to six miles from the present main line of the railroad, and, travelling by motor bus over a first class road should not occupy more than from twelve to eighteen minutes. Passengers and freight may thus be landed directly at their destination, and a flexible service for travelling at any hour of the day or night will thereby be provided, as compared with perhaps not more than two trains daily if a railroad were to serve the district. The announcement that the Government has decided to assist mining interests of the north by taking over and assuring the continued operation of the only independent ore sampling plant which serves the mines of Northern Ontario will be welcome news for those engaged in the north's mining industry.

The attitude of the Ontario Bureau of Mines in taking cognizance of the reasonable requests of mining interests for assistance in matters of this kind, is going the full limit in serving the best interests of the mining industry. The Department commands a full measure of request in the entire field of its activities, by reason of just such general response to the earnest requests from those localities and that part of the country's industry which falls within the scope of its jurisdiction.—J. A. McR.

Cork-Province.

After having been closed down since last November, because of the failure of water for milling purposes, the Cork-Province Mines, Ltd., south fork of Kaslo Creek, have resumed development.

THE ANTICS OF SILVER.

Released from the bonds of government control, and in greater demand than ever before during the past quarter century, the quotations for commercial bar silver have been fluctuating violently during the past week. In the position of having to find a price level, based entirely on the law of supply and demand, the antics of silver quotations is baffling not a few of those well versed in the precious metal trade. Sooner or later the quotations may reasonably be expected to get into a more or less even groove, but, for the present, conservative mining interests refrain from offering opinion. That the price will rule high for several years is confidently expected. In the Cobalt field the trend of the metal market, it is believed, will encourage additional exploration work on idle properties as well as in the idle areas of the present producing mines.

The Dome Report.

The eighth annual report of the Dome Mines contains no important surprises. The most significant feature, perhaps, is the fact that underground facilities for handling ore will now make it possible to handle about three thousand tons of ore and waste in two shifts of eight hours each. This is considered to be particularly significant, in that the present milling facilities are good for treating only about one-half that amount of ore. The interpretation placed on this in some quarters is that an early increase in milling equipment is under contemplation.

Other features are the facts that no ore was developed below the 800-foot level, the deeper workings having been carried out in connection with the ore handling system and not for exploration. Diamond drilling, at 1,150-ft. level, however, indicated considerable ore. The surplus as of March 31st was $56,801.26, as compared with $524,797.76 one year ago, a decline of $467,996.50 during the year, owing to the large amount of work done while the mill was non-operative.

The fact that the report was in the hands of shareholders just four weeks following the close of the fiscal year, is generally looked upon as ample proof that shareholders are to receive every possible consideration. The attitude of Mr. Basche, president of the company, is creating a favorable impression in the north. Not only does the report cover operations during the past year, but indicates as clearly as is humanly possible the probable course of working during the coming months.

It is interesting to note that whereas ore reserves are estimated at close to two million tons, the general manager, Mr. Kaeding, declares some four years' ore is in sight. This would indicate the expectation of being able to treat about 500,000 tons annually. The ore reserves have previously been estimated to contain $5.10 to the ton, and it follows a production of about $2,550,000 would be shown annually. Provided costs are maintained at about the pre-war rate, a net profit of some $1,250,000 would be shown per annum, or equal to about 31 per cent of the company's $4,000,000 issued capital.

The mill has resumed work this month on a moderate scale, and is rapidly being speeded up to 600 tons daily, following which it will gradually be brought up to full capacity of about 1,350 tons daily. Maximum production will probably not result for some little time, but now that a beginning has actually been made, the future outlook is satisfactory.

A CORRECTION.

To the Editor of the Canadian Mining Journal:

Sir,—The writer has frequently been irritated by the evident inaccuracies of the daily press when dealing with figures of any kind. Almost daily one sees figures in the heading of a news item which cannot be reconciled with those given in the text below. This might possibly be excused by the daily rush to have the paper printed and the wide range of subjects with which a newspaper deals. It is a different thing, however, when a supposedly respectable and sober technical journal treating of matters in its own sphere tries to force down its readers the statement attached. It cannot be explained as a clerical error or misplacement of a decimal point. I for one will not allow you to remain under the delusion that you have got away with it. You stand unmasked!

Yours, etc.,

THOUGHTFUL READER.

Toronto, May 9th.

The following appeared on page 289, April 23rd number: "The gold production of the province (Nova Scotia), during the period of the war has been but a few thousand ounces. The total gold production of Nova Scotia from 1862 to 1917, was 956,497 ounces from 2,187,493 tons of ore crushed, which shows the high average yield of 2.28 ounces per ton."

The average yield was, as might be estimated from the total tonnage and yield, about .45 oz. per ton or a little under $9.

PLACER MINING IN CARIBOO DISTRICT.

Victor Dolmage, of the Geological Survey Department, Ottawa, has issued a report on the Cariboo Gold Fields in the summary of which he states that, with the completion of the Pacific Great Eastern Ry., there should be a marked rejuvenation of the placer mining industry of the Cariboo. Last summer he spent some time in a reconnaissance survey of the district and in visiting the various placer mining operations in the area. Last year's gold output was only $82,000, as compared with the average of recent years of $200,000. Shortage of labor and depreciation of the purchasing power of gold are given as reasons for this decline. Of the $75,000,000 produced by the placers of this Province Cariboo has produced $45,000,000, the greater part of which was recovered between 1860 and 1878 when the rich accessible parts of the stream beds were mined. The Cariboo Gold Fields embrace 7,000 square miles and lie within the bend of the Fraser River between the C. P. R. and the G. T. R., the mining centre being Barkerville, 230 miles directly north of Ashcroft. The area may be reached by motor from Ashcroft or by steamer from Prince George. Practically all the promising placer ground in the Barkerville area has been staked, though, owing to present conditions, the majority of the claims are idle. Mr. Dolmage believes that an improvement in transportation facilities into the district would stimulate prospecting along the creeks. There is a possibility of an increase of mining of the deep ground along numerous creeks. Prospecting with Keystone drills has given satisfactory results, but the excessive pressure of underground water has made the exploiting of the deposits by drift mining impossible as yet. Much of the ground is suitable for dredging. The distance from the present railways makes the cost of installing machinery high and constitute a handicap to development.

NIPISSING.

In his monthly report to the President and directors of the Nipissing Mining Company Manager Hugh Park says:—

"During the month of April the company mined ore of an estimated value of $219,927 and shipped bullion from Nipissing and custom ore of an estimated net value of $305,989. Favorable developments continued to be encountered underground, particularly on veins 99 and 109 at 96 tunnel. All producing faces at shaft 73 continued to be satisfactory. Vein 99, being developed through the workings at 96 tunnel, showed great improvement during the month. This vein had previously been drifted on the tunnel level for some distance, showing approximately one inch of 1,000-ounce ore over a length of fifty feet. A winze was recently started and a test level was established at 50 feet. At a distance of 25 feet from the winze the vein widened from almost nothing to one inch of high-grade ore, alongside of which was one-half inch of matted wire silver. Several rounds have since been taken out and the vein is improving in width.

"Vein 109, also worked through 96 tunnel, continued to be satisfactory throughout the month, 130 feet of drifting having been done to date, over which distance the vein averaged two inches in width and 3,000 ounces to the ton in assay.

"Veins 99 and 109 will shortly be developed by a level at 90 feet below the tunnel. An old winze has been pumped out and cross-cutting to the vein will commence immediately.

"At shaft 73 no new veins were encountered in any of the cross-cuts. Developments on vein 544 were only fairly satisfactory throughout the month, due largely to much faulting. At times the vein has been four inches in width, but of low value. Some raises have been commenced, and if these prove to be satisfactory a level higher up will be started.

"Drifting and cross-cutting have been started at the second level of 64 shaft in a area some distance to the north of 64 vein. No favorable developments were encountered at shafts 63 and 128. The low grade mill treated 6,343 tons of mill rock and 169 tons of high grade ore. The refinery shipped 301,458 fine ounces of bullion."

Want Grant for Electric Smelter.

A delegation waited on Premier Oliver, of the British Columbia Government, and asked that a loan of $300,000 be arranged to permit the installation of a Rothern Electric Smelting Plant in this Province. Representatives of those who control the smelter patents were supported by Mayor Vance, of North Vancouver, B. C.; Reeve Fletcher, of Port Grey Municipality, B. C., and other prominent citizens. The Premier gave the delegation a hearing and promised that a report would be obtained on the process immediately on the return of Hon. Wm. Sloan, Minister of Mines, who is in Eastern Canada at present. Samples of steel were shown which, it was claimed, were produced from magnetite ore, of the kind to be obtained in quantity in this province, during the space of four hours. The Government was informed that the Rothern furnace now is situated near Seattle, Wn., and that a favorable consideration of the request would secure the industry for British Columbia. It is understood that, in addition to the loan, the principals would ask for a free site and other miner concessions.

Nova Scotia's Side of Coal Area Question

A statement regarding the question of undersea coal areas in Cape Breton has been given out by the Nova Scotia Steel & Coal Co. It is as follows:

The statement of the Dominion Coal Company, in opposing the proposal made by the Nova Scotia Company, that an exchange of undersea coal areas, should be brought about by legislative action, assumes throughout, that such an exchange would lessen the value of the equities upon which the stock and bond issues of the Dominion Coal Company have been secured, and would lessen the reserve tonnage of metallurgical coal required for the future operation of the Dominion Steel Company.

No such effect could possibly follow the exchange of undersea areas which is proposed by the Nova Scotia Company, as would very readily be seen by an impartial mining engineer who would take the trouble to examine the nature of the proposed exchange.

Far from decreasing the reserves of the Dominion Coal Company, the exchange suggested would increase by several hundreds of millions of tons the available metallurgical coal tonnages of the Dominion Coal Company. Not only would it do this, but it would prevent the Dominion Coal Company from being compelled some years from now to abandon a number of undersea collieries when the workings reach the limits of the Dominion Coal Company's present undersea leases, and encounter the outer leases of the Nova Scotia Company, some two miles from shore.

The proposal made by the Nova Scotia Company does not refer in any way to the so-called, "blanket lease" of the Dominion Coal Company, which was the product of special legislation and upon which the securities of the Dominion Coal Company are floated.

The "blanket lease" (sometimes called the Whitney Lease of 1893), represents the consolidation of a number of individually owned properties, which were amalgamated to form the main coal asset of the Dominion Company. The most valuable part of the "blanket lease" consists of coal seams underlying the **land**, in which only the upper coal seams have been worked to any important extent. The land areas of the Dominion Blanket Lease constitute a magnificent asset, but its seaward extension is insufficient, seeing that over the most important frontage, namely that now being operated upon by the Waterford collieries, it is limited to two miles in a seaward direction.

A seaward extension of only two miles is insufficient to enable the maximum output to be won from the shore openings and, under the conditions of mining practice as understood to-day, the first thing an engineer would seek, before planning undersea collieries, in such a coal area as exists at Waterford would be to secure **all** the coal seawards.

Coal is being successfully mined off the Cumberland coast in England at a distance of 5 miles from shore. The Nova Scotia Company, operating only a few miles from the Waterford collieries, is mining coal 2 1-3 miles from the shore, and has made every preparation to continue the mining of coal indefinitely seawards.

The refusal of the Dominion Coal Company to consider the exchange proposals, is in effect a refusal to accept the opportunity to remedy the shortcomings and weaknesses of the "blanket lease." If the Dominion Coal Company were to examine impartially the proposal of the Nova Scotia Company, it would see that an opportunity was presented to acquire an area of metallurgical coal, of undoubted quality and extent, which would indefinitely prolong the life of the four new collieries now operating at Waterford and of several other collieries, which will some day be developed in this district. The whole argument of the Dominion Coal in opposition is based on the belief that the proposed exchange is inequitable to the Dominion Company, and on this belief it bases a plea for the protection of its vested interests and financial obligations.

If, however, it is demonstrated that the Dominion Coal Company's present and future financial and operating conditions will be improved by the proposed exchange, the whole lengthy argument of the Dominion Company in opposition thereto becomes of no effect. The Dominion Company has not attempted to controvert in detail the assertions of the Nova Scotia Company that the proposed exchange will improve the position of the Dominion Company, and it is a matter of honest belief on the part of the Scotia Company that its proposals have not been fairly and accurately investigated, but have been assumed to be necessarily inimical to the Dominion Coal Company, because they would be of immediate benefit to the Scotia Company.

The position of the Mines Department of Nova Scotia in the exchange proposal is easily understood, because while an undoubted problem exists, as between the two Companies, a much greater problem presents itself to the Government of Nova Scotia, whose revenues are largely dependent upon the coal royalties and whose position as steward of the peoples' interest in the undersea coal field off Sydney Harbor, places upon the Government certain inescapable responsibilities.

The existing situation in regard to the undersea coal leases off Sydney Harbor was well described by Mr. C. A. Magrath, the Fuel Controller, sometime ago who stated that "a map showing the coal leases in that part of the Province of Nova Scotia looks more like a checker board than anything else. . . . I have seen sufficient to warrant me in saying that there should be a readjustment of the leased coal areas in the Sydney District."

Mr. Magrath, realized that the tangle of leased areas was a condition which had come about under the administration of provincial laws, and can only be remedied by like authority and stated:

"This, however, is outside of any function of mine, and my request to meet an immediate national necessity has been so resisted, and so much fear expressed that the Dominion Coal Company's bondholders may suffer, that I feel justified in going on record as to my views in respect to the interest of the public.

"Furthermore, I hold that the **readjustment of coal areas would be in the best interests of the Companies themselves.** It would mean that each Company would have its areas so adjusted as to enable it to get

its coal at the lowest possible figure, and certainly it would do away with the one Company paying tribute to another — which the consumer ultimately pays — in order to get to some distant coal areas."

In its application to the Commissioner of Mines, the Nova Scotia Company pointed out that the existing arrangement of the undersea leases, if it were not remedied, would result in heavy duplication of expenditure by the operating companies and waste of effort, which would diminish the general prosperity of the coal industry. Furthermore, it was shown, that any attempt to mine coal in comformity with the existing lease lines must heavily increase the cost of mining, and thereby increase the cost of coal to the public. It is also certain, that unless the existing lease arrangement is made more sensible and practical, the life of the submarine coalfield will be shortened, and the accessibility of the remoter undersea coal and its preservation for future mining will be seriously endangered.

The Dominion Coal Company has not attempted to deny these obvious consequences, because they are undeniable and must be the inevitable result of any attempt to work the undersea leases as at present arranged.

In its letter to the Commissioner of Mines, the Dominion Coal Company has stated that its undersea collieries are **designed and intended only to mine a two mile belt of coal seawards from shore,** which in effect is a statement that it is not concerned to preserve the accessibility of any coal lying seawards of the twa mile limit, access to which will be rendered most difficult if not entirely prevented by the upper workings of the present collieries.

The announced policy of the Dominion Coal Company—if carried out—will have a two-fold effect, namely, to shorten the life of the existing collieries and bring about their abandonment at an unnecessarily early date, and secondly, to render it extremely difficult for another operator ever to extract the coal lying below the abandoned collieries. How such a policy can be of benefit to the Dominion Coal Company is not explainable.

On the other hand, on the North Sydney side, the submarine coal which the Scotia Company is asking to be given permission to mine in exchange for its Waterford areas, is in a large measure approaching or exceeding two miles distance from shore. There is the very best reason to believe that some of the coal which the Scotia Company is seeking to acquire by exchange, can never at any time be worked by the Dominion Coal Company, whereas it could be worked at once by the Scotia Company.

Moreover, there are other areas on the North Sydney side which the Dominion Coal Company can work, but only at some indefinite future date. Yet these same areas could be worked by the Scotia Company immediately, and at a much lower getting cost than will ever be possible to teh Dominion Coal Company, because the Dominion Company can only win these areas by making expenditures duplicating those which have already been made by the Scotia Company.

The attitude of the Dominion Coal Company is hard to understand, because by leasing certain areas to the Scotia Company it would have been possible for the Dominion Company to enjoy a substantial annual revenue from extra royalties without the expenditure of one cent of capital, and this, be it remembered, from coal areas which have remained undeveloped in the possession of the Dominion Coal Company for over a quarter of a century, and will remain indefinitely undeveloped unless they are mined by the Scotia Company.

If the Dominion Coal Company seriously contends that its equities will be damaged by the exchange of coal areas which is proposed by the Scotia Company, it is an evidence that these proposals have not been studied or given fair consideration. The present arrangement of the undersea leases is so unpractical and unworkable that the necessity for its correction is admitted by all parties. The objection of the Dominion Coal Company to the Scotia proposals is made apparently because some immediate benefit will be thereby conferred upon the Scotia Company, and this is not denied, because the motive behind the Scotia Company's application is to obtain relief from an intolerable situation. At the same time, because the Scotia will be immediately benefitted, it does not necessarily follow that the Dominion Coal Company and the Government will not be benefitted, which indeed is the case. The existing arrangement of undersea leases is bad, and its effects must also be bad on all the parties concerned. Equally so the correction of the existing evils will benefit all the parties concerned, and it should not be regarded as a bar to correction of the situation by legislative action, that some immediate benefit will accrue to one of the parties. If corrective measures are not applied, a situation which is bad will become worse, and not capable of remedy, and then all the parties will suffer and will be unable to obtain relief.

It is because the Scotia Company is the pioneer of submarine coal mining that it is first to experience the evil consequences of the haphazard and thoroughly unpractical arrangement of the under leases.

The situation of the Scotia Company to-day will be the Dominion Company's situation to-morrow.

Railroad Builders on Strike.

The strike of workmen employed in the construction of a branch railway to the Copper Mountain Mines of the Canada Copper Company has lasted over three weeks and there is as yet no signs of a settlement. The latest developments are the outbreak of trouble in that town for which the strikers are said to be responsible, notably the occurrence of fires and the cutting of hose brought to quench the flames, and, if press dispatches are to be credited, the molestation of women. A Committee of Citizens has been organized to preserve order and the Provincial Government has arranged for the sending of a detachment of Canadian Mounted Police to the scene. The serious aspect of the matter from a mining standpoint is that it affects the biggest new enterprise in British Columbia, the possibility being the closing down of operations on a property which represents an investment of $2,500,000 as the continuance of work at Copper Mountain is contingent on the provision of railway transportation facilities. The W. P. Tierney Construction Company has the contract for the work. Last fall the men worked a ten hour day at a minimum of forty cents an hour. Towards winter it was decided to cut down to nine hours a day and when on April 1st the company announced that the ten-hour day would come into effect again the men balked. Now they insist on an eight hour day and a minimum of fifty cents per hour with no overtime or Sunday work.

Dominion Coal Company's Side of Coal Area Question

Public interest in the dispute between the Dominion Coal Company and the Nova Scotia Steel and Coal Company by a statement issued by the Dominion company regarding a further division of the submarine areas. In this statement there is a bill before the Nova Scotia Government for the purpose of obtaining sanction of the Legislature to the Order-in-Council permitting the Scotia company to break through the barriers of the Dominion Coal area on the north side of Sydney harbor. President Workman's objections to this bill are briefly:

"1.—That its titles were granted under such legislative sanctions and held under such legislative pledges that the legislature ought not now to alter them.

"2.—That the proposition of the Nova Scotia Company is so inequitable it ought not to be considered. It is that this company's inshore areas containing millions of tons of excellent metallurgical, easily won coal should be forcibly taken from it and that there should be given in exchange submarine areas that have not been proved and cannot be proved to contain coal.

"3.—That the Nova Scotia Company has ample reserves of coal and should develop these.

"4.—That this company's coal areas in North Sydney are vital to the maintenance of its industries, the magnitude of which are outlined.

"5.—That its security holders purchased its securities under such circumstances that no Legislature ought to change the property pledged without the consent of the holders."

The reasons given by the Nova Scotia Steel and Coal Co., for asking the Provincial Government to readjust the leases are taken up by Mr. Workman. The substance of these he sums up as follows:

"That it has reached the boundaries of the seams presently being worked in its leased areas and that to extend these workings to its outside areas would cost a large sum of money; that if it did extend these workings the cost of winning the coal would be prohibitive; that the present operations endanger the possibility of winning the coal from outside areas; that upless it can secure metallurgical coal at cheap cost it must close its blast furnaces, and that this will be accompanied by the decay of the towns that exist by reasons of its operations."

In this connection he remarks:

"It is true that it endeavors to state its own necessities in the form of general propositions, and without any justification in fact asserts that the Dominion Coal Company will soon have to restrict its operations at Glace Bay by reason of its workings coming to the boundaries of the outside areas of the Nova Scotia Company. The application is based upon the necessities of the Nova Scotia Coal Company and not upon any public interest involved. The unwarranted suggestions are made that royalties will be lost to the Province; and that the cost of coal to the public will be increased if the Nova Scotia Company's present workings are not utilized to extract coal from its neighbor's property."

Mr. Workman finds some discrepancies in the statements made by the Nova Scotia Steel and Coal Co. when it was issuing securities and those contained in the present application. These points are dealt with as follows:—

"It is difficult for this company to understand the merits of the Nova Scotia Company's application if based on its own necessities. When it sold its securities in London and to the public in 1913, its prospectus then issued by the authority of its responsible officers stated that it has 2,556,900,000 tons of coal at Sydney Harbor. So late as 1915 the Royal Securities Corporation of Montreal, in selling $1,000,000 of debenture stock, repeated this statement in its selling prospectus. The report of Mr. Eckel, a mining engineer, also placed the Scotia holding at 2,500,000,000 tons."

"In 1913 the Nova Scotia Company represented to this company that it desired to reach its submarine areas near Cranberry Head and a lease of all the coal in the Sydney main seam of two square miles was granted the Nova Scotia Company by this company to enable it to extend its Princess pit to reach its outside areas. The royalty charged was only 10 cents per ton and in the territory granted were 12,000,000 tons of excellent Metallurgical coal. Plans submitted with the application show the workings have not been effectively prosecuted in this large body of coal. The present possible output from these workings is said to be 1,200 tons a day. From the experience of this company it is believed that by the proper development of this mine its capacity could easily be increased to 2,000 tons per day. With all this coal available and capable of being worked it is difficult to understand the statement in the application that the Princess Colliery is "now faced with complete exhaustion."

The enquiry of the Fuel Controller, Mr. Magrath, is also quoted in the same connection.

After dealing with the necessity of the Dominion Company maintaining its reserves of metallurgical coal, so essential to the steel department as well as to the sale of the company's securities, Mr. Workman concludes:

"This company desires to emphasize not only the question of sanctity of titles, and the unfairness of the suggestion in the memorandum filed by the Nova Scotia Company where proved coal can be won at a low cost is to be taken and unproved territory given in exchange, but also the necessities to the existence of its undertakings of an ample reserve of metallurgical coal.

The Dominion Coal Company and its allied corporations have gone into the market eight times to secure money to acquire, build and prosecute its undertakings. It may have to go again; but what reception will its prospectus have if it becomes known to the financial world that its leases are to become the prey of anyone coveting its metallurgical coal?

"The company has taken a position from the beginning of this discussion that it is its duty to its shareholders and security holders to maintain its properties for the purposes for which they were acquired. It must also keep faith with the banking houses of

world wide reputation who bought its securities from the company and sold them to their clients. Common business honesty requires that this company maintains that position.

It is not the province of this board to do more than respectfully urge upon the Government the consequences that would follow interference with its titles granted after the discussion and sanctions already pointed out. Capital would shun investments in this province and the high reputation for integrity that the province enjoys would be tarnished. It is not in consonance with British institutions or the traditions of our race to nullify contracts by legislative action. So rigid are these principles fixed in the national character that it is given expression to on every occasion."—Financial Times.

Platinum Deposits in B. C.

Discussing the platinum deposits of British Columbia, which he investigated last year, Mr. Camsell says: "Considerable interest was shown in prospecting for placer as well as for lode platinum throughout the province as a result of the publicity given to the government's requirements, the establishment of a local market in the assay office, Vancouver, and the free assaying of platinum ores in that office. "For this reason he thinks that there should be a noticeable increase in the platinum production this year. The Tulameen District in the past, it is pointed out, has been the largest producer of platinum on this continent and to meet the urgent demands of the British Government this seemed to be the most likely field from which an extra supply could be secured.

Reference is made to investigations made in the Tulameen in company of Eugene Poitevin, who was making a study of the geological conditions under which platinum occurs in that district and comparing them with those in the Ural district of Russia, from which the greater part of the world's supply of platinum has been derived. He also visited the Nelson district and sampled deposits on Rover Creek, a Philadelphia chemist having ben said by the owners of one of the properties visited to have made an assay return of 2½ ounces of platinum to the ton and considerable gold. Mr. Camsell tells of the putting of two drills to work at the mouth of Slate Creek by the Government following the engineers' reports. He does not say what was achieved, but the work was not continued after the signing of the Armistice, although the indications up to that time were promising. At any rate, as Mr. Camsell says, there was considerable more activity in the district during the year and some forty ounces of platinum were produced.

After speaking of investigations on Potato Creek, at the head of Jervis Inlet, where platinum was said to exist, and on Shuttleworth Creek, which enters the Okanagan Valley at Okanagan Falls, where the geology suggests the possibility of the existence of platinum, Mr. Camsell states that it has been known for years that the mineral occurs in the gravels of the Fraser River in association with placer gold. Traces have been obtained in the course of dredging operations at Hope, B.C. About three quarters of an ounce was obtained by J. Russel, of Lilloet, B. C., by cleaning up the tables of an abandoned dredge, which some years ago was in operation a few miles below that point. Considerable platinum also occurs in the gravels of the Quesnel River, and its presence was demonstrated last year on Government Creek, which enters the Fraser River about forty miles below Fort George.

Adanac.

With regard to the reports recently printed in contemporaries pointing out negotiations for control of the Adanac mine by English interests, the report has been found to have no foundation in fact, according to official information just to hand.

In the meantime, good results are obtaining at the mine, a considerable quantity of high grade ore being encountered.

Mining Convention at Nelson in June.

Eastern British Columbia is to have an International Mining Convention during the month of June. The scene of the gathering will be Nelson, B.C. When the proposed Spokane, Wn., Convention was postponed some time ago mining men of the Provincial Interior determined that they would undertake the organization of such an assemblage. The enterprise of the B. C. Chamber of Mines in staging the recent International Convention at Vancouver, B.C., was not then foreseen, but it is not proposed that that shall interfere with the meeting at Nelson. Preparations are well in hand. Strong representation is promised from the State of Washington and particularly from the City of Spokane and there will be delegates in attendance from all the Eastern British Columbia Mining Districts. It is likely that the programme will provide for the discussion of many of the problems peculiar to that section of the Northwest.

Will Develop Coronado and Victory Mines.

There are good prospects that the Coronado and Victory Mines, Omineca, B. C., will be actively developed. These properties have been taken over by the Skeena Mining and Milling Company, which is incorporated for $250,000. The plant is being put in condition for operation. Water power is being taken from the Sloan and Halley Creeks and with this the plant will be able to develop 100 h.p. There is a concentrating mill similar to that of the Silver Standard Mine at New Hazelton and other equipment is to be installed which will permit the treatment of 100 tons of ore a day.

Mining Development in the Slocan.

Mining development in the Slocan and other Kootenay Districts of British Columbia is not lagging despite unfavorable market conditions. Andrew G. Larsen, a mining engineer interested in this section, explains that many properties, owing to the silver contents of their ore, are able to proceed with operations and store the lead if necessary. The Surprise, a silver mine at Sandon, B.C., is to be opened up and development is being vigorously pushed on the Noble Five because of its silver, the intention being to take the fullest advantage of the present market. A tunnel has been driven from which there is a raise to the ore bodies and the management is discussing the installation of a concentration mill. The mill also is to be started on the Cork-Province near Kaslo, B. C. The Florence Silver Mining Company has been operating its mill at capacity for several weeks and at less than capacity for months before. Silver bearing ore is being drawn from a number of its properties by the Canadian Consolidated Mining & Smelting Co. It is expected that the mill of the Silversmith Mines soon will resume operations, it being reported that development has resulted in the proving of a large body of good ore.

Mineral Areas of Alberni Canal

Dominion Geologist Makes a Preliminary Survey of Prospecting at West Coast Points.

Mr. Victor Dolmage, of the Canadian Geological Survey, to whom was assigned the work of a reconnaissance survey of the mineral areas of the northern portion of Vancouver Island during the season of 1918, after having gone over the district contiguous to Quatsino Sound, proceeded to cruise down the west coast of Vancouver Island, and for three weeks examined as many mineral localities as time and circumstances would permit. Owing to the lateness of the season, states Mr. Dolmage, and to the fact that local guides were not always available, many of the deposits, and in some cases the best, were not examined. Some prospecting was done during the trip, and such observations on the geology of the region made as would suffice to outline plans for future work.

The Indian Chief Group.

One of the properties visited by Mr. Dolmage was the Indian Chief, which is situated on Sidney Inlet, and which is one of the only two claims in this portion of the district which has reached the shipping stage—the other shipper being the Monitor, situated near the entrance to Alberni Canal.

The Indian Chief group, now owned and operated by the Tidewater Copper Company, has been worked at many times and by many different companies since 1897, and has produced a lot of high grade ore. At present it is equipped with a small oil-flotation concentrating-mill which is situated on the beach and connected with the mine by an aerial tram. The ore, which consists of bornite with small amounts of chalcopyrite and chalcocite, occurs in a garnetized limestone, capping a hill composed of granodiorite. The limestone, except at the very top of the mountain, is metamorphosed and signs of mineralization are plentiful. Some very rich bodies of bornite have been extracted from both the north and south sides of the hill, and some smaller ore shoots have been discovered in the main tunnel on the south side. The mill, which was completed only a little over a year ago, was operated for a few months only and at a considerable loss. This was partly due to the unsatisfactory nature of the machinery in the mill and partly due to an irregular supply of ore often of too low grade. The mill was shut down, and a shipment of picked ore was made direct to the smelter. At the time of the examination a small force of miners was carrying on development work in the main tunnel.

The Monitor Group.

The Monitor Group of claims is situated on the north shore of Alberni canal just at its entrance, the mineralized zone extending back from the shore several thousand feet. The property was discovered in 1898 and during 1900 and 1901 steadily produced ore which was shipped to the Tacoma smelter. From 1902 it remained virtually idle until 1916. The present owner, Mr. Leonard Frank, of Alberni, bought the property some years ago, at a tax sale. Since 1916 it has been leased to James Skeen of Seattle, who has done considerable work on the various showings that have been discovered since his taking charge, and has installed considerable expensive equipment. The ore consists of pyrrhotite and chalcopyrite with small amounts of magnetite and pyrite. It occurs chiefly in the altered limestone, which consists of calcite, quartz, garnet, epidote, and actinolite. Some of the ore is found in the metamorphosed volcanic rocks which are altered to epidote, chlorite and hematite. Like all the deposits of this type found on the west coast of Vancouver Island the ore is very irregular and the value of the mine, therefore, difficult to estimate. A considerable tonnage of shipping ore averaging 8 per cent copper has been proved and in the new showings there are large lenses of concentrating ore of medium low grade, but it is doubtful if sufficient ore has been proved to warrant the installation of a concentrating plant. At the time of the examination the mine was shut down on account of financial difficulties.

Black Sands.

A visit was also paid to the Wreck Bay Beach placers lying between Kennedy lake and the West coast of the Island, and extending from Ucluelet to Tofino inlet in a flat coastal plain composed of unconsolidated sands, fine gravels, and thin beds of blue clay. The plain is about 60 feet above sea-level, and is bounded along the coast by a perpendicular wave-cut cliff at the foot of which is a beautiful beach sloping gradually out to sea. These sediments contain a small amount of black sand and fine gold which is being continually concentrated at the base of the cliff by the action of the waves. Prospectors and campers came periodically and cleaned up the gold by panning the black sand found at the foot of the cliff. Several attempts have been made recently to use small concentrating machines operated by hand or by small gasoline engines, but the amount of sand is too small for continuous operations and is soon worked out. A number of years ago some of the local settlers organiezd a company and installed a flume, and sluice boxes, from which were obtained several thousand dollars worth of gold, this being the first time these wave-washed concentraters had been worked. The gold probably comes from the gold-bearing quartz veins that are known to exist in the mountains to the west of Kennedy Lake. The quantity of gold in the sediment is much too small to be extricated commercially by working them where concentration had not already been effected by wave action.

MINERAL DEPOSITS OF SOUTH AMERICA.

By Benjamin L. Miller and Joseph T. Singewald, published by McGraw-Hill Book Co., Inc., New York. Price $5.

This excellent compilation of information concerning minerals and mines of South America has been written by two American geologists who made an extended trip through South America in 1915. They have during the past few years contributed a number of articles to the Engineering and Mining Journal on their observations. In this book their personal observations have been supplemented by a bibliography of the available literature. Many competent authorities have assisted the authors, both during their visit to the various mining districts and subsequently. Those who are interested in any way in the ore deposits of South America will find this comprehensive treatise very useful.

Special Correspondence

NORTHERN ONTARIO.

Dome Mill in Operation.

The mill of the Dome mines has resumed operations after having been held in idleness for the past year and a half due to economic pressure caused by the war. The mill is now operating at a moderate rate, and will rapidly be brought up to a capacity of about 600 tons daily. Following the establishment of the required organization, the capacity will gradually be increased until a maximum tonnage of around 1,350 tons daily can be treated.

The policy of the management is to maintain a high degree of efficiency, toward which end a gradual building of forces will be necessary rather than the rapid accumulation of large forces.

Work Resumed at Barton-Munro Property.

Work has been resumed on a small scale on the property of the Burton-Munro property, situated in the township of Munro.

McKinley-Darragh.

The McKinley-Darragh mine is producing silver at the rate of about 1,100,000 ounces annually, according to figures based on the output for the first quarter of the current year. It is understood the output for the first quarter amounted to about 275,000 ounces, and that the value of production average about $92,000 monthly.

Dividend disbursements at the rate of 12 per cent. annually call for the distribution of some $67,428 every three months. In connection with this it is interesting to note that provided net profits amount to about 33 cents per ounce as was the case during 1918, the present net earnings amount to about $30,000 monthly, or about $22,000 quarterly above dividend requirements.

The oil flotation plant has just been set in operation, having a capacity re-treating some 250 tons daily of sands and slime from past operations.

Tough-Oakes.

The development of the Tough-Oakes Gold Mines has assumed proportions of leading importance. During the month of April, according to official advice, approximately 1,016 feet was driven in the underground workings. A total of 98 men were on the payroll at the end of the month and seven machines were employed. It is evident, therefore that an average of close to 150 feet daily was accomplished with each machine during April. While in some of the work the speed attained was slower than the average, there were instances where drifting was carried on at the rate of around nine feet daily.

During the month a new vein, containing $20 ore across the full width of the drift, was encountered and opened up for considerable distance. Development work on other veins also proved satisfactory and a considerable tonnage of ore is being either broken or blocked out ready for treatment just as soon as the management consider the time opportune to re-open the mill.

The company now has about $140,000 in its treasury after having retired all debts, and it will not be necessary to start milling prematurely in order to meet financial obligations.

Plant for Charette Property.

The installation of steam driven plant on the Charette property in the township of Boston has been completed, and will greatly expedite the exploration and development of this promising prospect.

Casey Mountain.

The Casey-Mountain Syndicate, operators of the property of the Casey Mountain Mining Company, Ltd., has let a contract for driving a 200-ft. cross-cut.

The property is situated about two miles northeast from the Casey-Cobalt mine, situated in the township of Casey. A shaft has been driven to a depth of 425 feet, during the course of which work, a layer of diabase about 320 feet thick was cut, followed by a layer of conglomerate about 110 feet thick, underlying which is keewatin formation. The geology, therefore, is considered favorable, and exploration will be directed in that zone immediately above the conglomerate-keewatin contact.

While sinking the shaft, commercial values were encountered in a fracture occuring in the diabase formation. At one point, it is stated, values average about thirty ounces of silver to the ton over a width of several feet.

Temiskaming.

Reports continue to the effect that the Temiskaming mine has developed an important orebody at the 500-ft. level. In spite of the absence of official confirmation, it is reported in usually well informed circles that the vein has an average width of upwards of four inches, and is composed of high grade ore, in fact the discovery being reported to be one of the richest ever made in the mine. It is stated that about sixty feet of drifting has already been done as well as about thirty-five feet of raising.

Mining Corporation.

The Mining Corporation of Canada will diamond drill on its property in the south-eastern part of the township of Bucke for the purpose of exploring the much discussed contact which may be traced for several miles, running in a north-westerly direction. A hole will be driven to cut the contact at a depth of about 300 feet.

Power for Miller Independence Mine.

A conference was held this week between Miller Independence interests and the Northern Ontario Light and Power Company, and an agreement reached whereby the power company will construct a transmission line to the property, from its main Kirkland Lake line. The necessary motors and equipment is being placed on order so as to eliminate any chances of delay in changing from steam to electric power, immediately following the completion of the transmission line.

This week machines are being put to work in the incline shaft where such rich gold telluride ore was opened up during the last half of 1918; also, a station is now being cut at the 200-ft. level of the new central shaft so as to make room for setting up a diamond drill machine preparatory to carrying out exploration work well in advance of actual development work.

Will Operate Huronia Mine.

The power line to the Huronia Mine, at Beaverhouse Lake, in the Larder Lake gold area, is being repaired, following which mine operations will be resumed. The old and obsolete mill is being torn down, and, should development work prove to be satisfactory, a new mill will be constructed at some later date.

Wisconsin-Skead.

A statement has just been issued by the Wisconsin-Skead Mines, in which assay results are enumerated, showing considerable commercial ore has been opened up on the company's property, situated in the township of Skead.

Diamond drilling carried on to a depth of nearly 600 feet indicated ore at that depth.

Encouraging Prospecting.

An article which appeared in the Canadian Mining Journal in its issue of April 30, dealing with the question of "Encouraging Prospecting," is being read with interest by mine operators in Northern Ontario. The article, which has evidently been prepared with a good deal of thought, has a ring of sincerity and contains a number of suggestions that should prove beneficial, if carried out. Six points are brought out, all of which appear to deserve careful consideration. The six points are these:—

"1. The levying of 2 per cent. tax on all profits in mining, such money to be expended by the company paying the tax in actual prospecting and under their sole suprvision and for their sole profit.

"2. Increase geological work by the Government.

"3. Government night schools for prospectors.

"4. Collection of minerals at all Government recording offices, night schools, and other localities were of advantage to the prospector.

"5. Five free assays with each miner's license.

"6. Government testing plant, where small lots of ore could be sold."

The foregoing forms the substance of the Journal's article.

To deal with these points separately, it should be pointed out that with regard to suggestion No. 1, that of all the mining companies which have won success in mining the amount of money spent annually in prospecting is even now very considerable. In some instances the annual outlay is greatly in excess of 2 per cent. The writer is of opinion that a direct tax for the purpose would only involve unnecessary red tape. Indeed as matters now stand the large army of independent prospectors in the field derive a good deal of support from the successful mining companies which are ever on the alert for new property. There would not appear to be any necessity of a direct tax for the purpose.

With regard to point No. 2 there appears to be room for adding to the extent of geological work, particularly in the northern districts. With regard to this, it is understood a very extensive programme has already been decided upon this year by the Government.

Concerning point No. 3, the suggestion that a system be provided for the purpose of giving the prospectors the benefit of a short course in geology and mineralogy appears to be one worthy of the united support of all mining men.

Points No. 5 and 6 could be dealt with jointly. With regard to these, it will be interesting to turn to the official announcement in this issue which conveys the information that the Ontario Government has taken over an ore sampling plant in Cobalt. This plant, it will be noted, is equipped for sampling shipments of ore either in small lots or in carload lots. Thus, the shipper, no matter how small or large, learns the value and content of his ore and, in the case of silver ore, can dispose of it to local mining companies who are in the market for ore, or, in the case of other mineral can find a market at whatever point equipment suitable to treat it is in operation.

With regard to the ore sampling plant it has not yet been learned whether or not an assay business will be conducted in connection with the plant. It would appear to be probable, however, that such will be the case. The suggestion might not be remiss that the Government should take this phase of the question into consideration and conduct an assay business for the benefit of prospectors, the latter to be charged only the actual cost of making the assay.

Government Takes Over Sampling Plant.

At the request of mining men of this district the Ontario Government has decided to provide the mines of Northern Ontario with ore sampling facilities, toward which end an arrangement having been concluded with the Temiskaming and Northern Ontario Railway Commission to take over the plant of Campbell & Deyell, at Cobalt, and at once put it under the supervision of Arthur A Cole, Mining Engineer for the railway.

Early in the current year mining concerns grew alarmed over the announced intention of the firm of Campbell and Deyell to close its sampling plant. An appeal was addressed to the Dominion Government through Hon. Frank Cochrane, M.P. for this district. The appeal was ignored. The facts of the case were then placed before the Ontario Bureau of Mines, and the great inconvenience that would devolve upon the mines as well as prospectors were shown and were quickly recognized by Hon. G. Howard Ferguson, Minister of Lands, Forests and Mines. Negotiations were entered into almost immediately, with the result as stated above.

Mining men in general appear to recognize the fact that this movement on the part of the Ontario Government is somewhat of a departure from the usual procedure, and was only taken after becoming firmly convinced of the great importance of such a plant to the mining camp. The step is looked upon as another demonstration of an earnest desire to lend the utmost encouragement and assistance to the mining men of this province.

At first it had been supposed that any one of several leading mines of Cobalt could easily afford to purchase and operate the ore sampling plant, but this belief was not well founded because of the fact that these mines are in the market to buy ore from other mines, and naturally desire independent interests to appraise the value of any such purchases of ore. It should be pointed out that an ore sampling plant such as that of Campbell and Deyell's just taken over by the Government, serves as medium by which the vendor of ore can determine the content of that which he desires to sell, and the purchaser learns the value of that which he desires to buy. In shipping ore to southern smelters it is found possible to appraise the value of the shipment here, the smelter accepting the figures given. This makes it unnecessary to either

send representatives to the smelters to keep tab on the ore in process or take pot luck on the returns.

Therefore, in taking over the plant and assuring its continued operation, the Ontario Government has taken a step that will probably meet with universal approval, not only in the mining camps in this part of Northern Ontario, but in all mining camps where the value of such assistance to the mining industry is fully understood.

Minister of Mines Visits Northern Ontario.

Hon. G. Howard Ferguson spent several days touring the northern district in connection with the huge construction program which has been decided upon by the government. The Minister of Lands, Forests and Mines came north on May 6th, returning south May 11th. During the course of his tour, he visited Elk Lake in connection with the Elk Lake Gowganda waggon road, later calling at Boston Creek, thence at Kirkland Lake in connection with the plan to construct a first class motor road for the benefit of the mines. It has been officially stated that the railway project to the camp will be held, pending further development. The decision to build a motor road is in compliance to the wishes of the leading mine operators of the camp, the government having previously announced its intention to build a railroad. The Minister also visited Timmins in connection with the extension of the railway from Timmins to Temagami Heights, later continuing on to Kapuskasing.

Hollinger Force is Growing.

The Hollinger Consolidated has upwards of 1,300 men employed, and intends taking on an additional 450 just as soon as that number can be conveniently absorbed, it has just been learned. Efficiency is gradually increasing and the mine is gradually increasing its volume of output.

With a force of perhaps 1,750 men on the pay-roll before the end of the summer, it can at once be reckoned the very extensive community that is rising round about the mine. In addition are a number of other important mines. As a consequence, the town of Timmins is growing rapidly in population and the building program is totally inadequate to meet the situation.

United Porcupine.

The United Porcupine Mine, scituated a short distance south from Golden City, in the township of Whitney, has been sold, it is reported. The property was worked a good deal prior to the fire of 1911 which destroyed the mining plant. Since that date, not much work has been done. New York interests are said to have purchased the property.

Fidelity.

On the Fidelity property, which adjoins the La Belle-Kirkland Mines on the west, sinking operations have been carried to a depth of about 100 feet. The vein, which showed a width of but two feet at a depth of 40 feet, has widened out, and at the present point of operation is said to be about eight feet in width.

Although sampling has not been systematically carried out, the heavy mineralization of the vein is encouraging.

La Belle Kirkland.

The Goodfish Lake section of the Kirkland Lake district is coming in for increasing attention. Encouraging developments on the property of the Fidelity Mining Company, together with the fact that a plan is under way, which, if successful, the La Belle-Kirkland Mines will be again operated on an extensive scale, is serving to rejuvenate activity among the property owners in that vicinity.

Although reports that the La Belle-Kirkland will resume operations immediately are somewhat premature, yet the development is considered a probability within a reasonably short time. The plans now being carried out by the La Belle is to sell 500,000 shares or less, of its treasury stock. On April 1st, of this year, the stock in the treasury amounted to 779,292 shares. This plan, if successful, would enable the company to at once proceed with development work, and in due course should add another producing mine to the Kirkland Lake list.

According to official information the main shaft has been carried to a depth of 360 feet. Drifts and crosscuts aggregate 1,150 feet. During the course of previous work some five veins have been opened up. In the main workings on No. 1 vein exposures of ore range from four to ten feet in width and contain average values of about $10 to the ton. Above the 275-ft. level, according to official estimates, some 40,000 to 50,000 tons of ore is in sight.

Up to the present the company has spent about $170,000 on the property, the operation having been conducted in a conservative manner under the management of Frank C. Loring. Diamond drilling performed about two years ago indicated the presence of ore to a depth of 700 feet.

The Tough-Oakes Merger.

Although official information on the subject is lacking, it is reported in regard to the proposed merger of the Tough-Oakes Gold Mines, with the Burnside and the sylvanite properties and the Aladdin-Cobalt Company, that the basis of exchange, as proposed, would work out at about $1.05 per share for the Tough-Oakes, it being intimated that the basis of exchange would be Tough-Oakes, one pound; Burnside, one pound; Sylvanite 10 shillings; and Aladdin 13 shillings.

Bourke's Gold Mines.

The Bourke's Gold Mines, operators of property at Bourke's Siding a short distance north-west from the Kirkland Lake field, has begun collecting data and making preliminary arrangements with a view toward proceeding with the installation of a small mill during the coming fall provided development work continues favorable.

As yet, the vein has been found to be comparatively narrow, the most extensive ore shoot being at the 100-ft. level, where the deposit shows a commercial gold content over a width of about twenty-eight inches and about 160 feet in length. The workings have since been carried to a depth of 200 feet, but sufficient lateral work has not been carried out to determine the extent of the ore shoot at that depth.

At the present time, the capacity of the mining plant is being increased with a view to carrying development to a depth of 500 feet. With this work completed, and followed by a reasonable amount of lateral work, the plans for the construction of a small mill will perhaps take concrete form.

Porcupine Crown.

Mr. Harry Darling, manager of the Porcupine-Crown Mines, is expected to arrive in camp about the middle of May, following which the mill will be tuned up preparatory to resuming production. Satisfactory progress is being made in operations made necessary by the cave in of the mine earlier in the year.

It is proposed to also carry operations to a depth of about 1,400 feet, as well as conduct further exploration work by diamond drilling.

Porcupine V. N. T.

Friction between the American and English interests involved in the Porcupine V.N.T. appears to have developed. Officials, while not denying the reports, are reticent. It is reported in usually well informed circles in the north that there appears to be some possibility of the withdrawal of either one of the factions. Reports have it that the English interests might, or perhaps have already done so, make a bid with a view to purchasing the interests of the American holders. The property has long since been looked upon as one of large merit. Lack of harmony has been a factor in retarding work on previous occasions as well as the present. The financial standing of the company is difficult to ascertain, but an official informed your representative that close to three-quarters of a million shares still remains in the treasury.

BRITISH COLUMBIA.

Fire at Princeton.

Railway construction men on strike at Princeton, B. C., became troublesome towards the end of April and are charged with responsibility for a fire which broke out at the Princeton Coal and Land Company's plant. That the outbreak was incendiary in its origin is supported by the fact that the hose, with which an effort was made to control the flames, was found to have been cut. While no definite particulars have been secured as yet it is not believed that serious damage resulted. Detachments of the Royal Northwest Mounted Police have been dispatched to the scene and it is confidently expected that order will be restored in a short time.

Merritt Collieries.

Satisfactory progress is being made in the opening of the new No. 3 Mine of the Merritt Collieries, Ltd. Two slopes have been driven as well as two levels. Thos. Rowbottom is in charge of the work.

Work Resumed at Wakesiah Mine.

The Canadian Western Fuel Company are continuing the development of the Wakesiah Mine. This work was pressed forward for some months and then stopped. Its resumption is taken to indicate the company's intention to put the mine on a producing basis as soon as possible.

Pumping Out Coal Mines at Suquash.

The Pacific Coast Coal Mines, Ltd., have pumped the water out of its old mine at Suquash, Vancouver Island. This property has been idle since the year 1914. With a ready market and good prices it is likely that the company proposes making it productive without delay. This mine is situated in what is known as the Suquash Coal Field of the Island, approximately 170 miles north of Nanaimo, B.C. Comparatively little active development has taken place in that section.

Activity at Kaslo.

Reports indicate mining activity in the district traversed by the south fork of the Kaslo Creek. With development being carried on at the Gibson Mine, and the Index, and with the Silver Bell added to the list of shippers; with the continuance of operations at the Cork-Province, which was closed down for a short time during the winter on account of the shortage of wash water for concentrates, the outlook is good. The increased attention being received by the properties of this section is their generally high values in silver.

Ore Testing Laboratories.

Hon. Martin Burrell, Minister of Mines in the Dominion Government, deals with the proposed establishment in British Columbia of one or more ore testing mills in a letter to F. A. Starkey, of the Associated Boards of Trade of Eastern British Columbia. He says: "Such a plant would be a branch of our ore-testing laboratories in Ottawa and would deal as far as possible with the various problems connected with the treatment of all minerals in order to stimulate prospecting and the development of those extensive mineral regions which have had little development work done on them, as well as the taking up the question of the treatment of various kinds of ores, the value of which it might be difficult to ascertain by those who could not afford to ship so far as it involved in sending to Ottawa. In any case it will necessarily take some time before we can get anything actually constructed and we hope to make an examination of some of the later ore-testing laboratories in the United States and shall give the fullest consideration to the situation in British Columbia, including that of the Kootenays, before decision will be reached."

Ground Caves at Phoenix.

An immense cave-in has occurred in the workings of the Granby Mine at Phoenix, B. C. No serious damage, however, is reported as such an occurrence was not altogether unexpected. The Great Northern and Canadian Pacific Railway companies' rails are not being used in the vicinity of the break so that a temporary interference with transportation has resulted. Residents are moving from the affected area.

Drilling for Oil in East Kootenay.

Drilling for oil in the Flathead District of East Kootenay is to be continued by the B. C. Oil & Coal Development Co., Ltd., headquarters Union Bank Bldg., Victoria. Four test wells had been put down before the war brought out and some oil had been taken from two of them. Arrangements were being made for the sinking to a greater depth when the outbreak of hostilities made it impossible to complete the financial arrangements. It now is hoped to complete the work and the company's directors appear to be confident of success.

Gold Strike Near Fairbanks.

Information has been received at Prince Rupert of a gold strike in Alaska, not far from Fairbanks, the scene of the find being more exactly described as on the Stuyhok River, a tributary of the Bonisilla, good prospects having been found on Henderson, Last Chance and Flat Creeks. One hole put to bedrock on bench ground netted forty cents to the pan from a general average of ten pans. At the time word was dispatched there were about 100 men on the ground and grub was reported to be scarce.

Reduction in Ore Treatment Rates.

The management of the Consolidated Mining & Smelting Company has issued a circular under date of April 23rd, 1919, announcing a reduction of ore treatment rates at the Trail Smelter. It reads as follows:

To Lead Ore Shipperss

Schedule B. lead ore rates provides for adjustment of the base rate up or down on the increase or decrease in the prices of coke or labor as follows:

On the price of coke 25 per cent of the increase or decrease per ton.

On the price of labor per shift 1½ per ton for each 1c charge per shift.

The last adjustment was an increase effective August 1, 1918, as outlined in our circular of August 27th, 1918, which amounted to 80c per ton.

The price of coke has advanced since then 40c per ton, which indicates an increase of 10c per ton of ore.

The price of labor has decreased since then .3646 per shift, which indicates a decrease of .55c per ton of ore.

The prevailing base rate of $8.30 per ton will be reduced, effective April 15th, 1919, 45c per ton, or from $8.30 to $7.85 per ton of ore.

Since the beginning of the year fifty-four mines have shipped ore to the Trail smelter. The total number of tons of ore shipped for the period is 117,964. During the week ending April 21st last a total of 7,420 tons was shipped to the plant. Following are the shipments for the year to date:

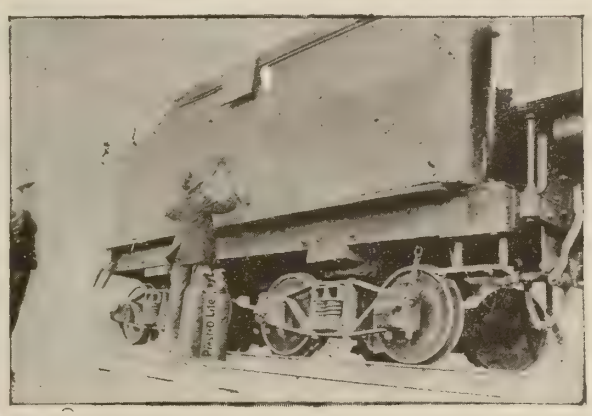
Districts.	Totals in Tons.
Boundary	22,832
East Kootenay	111,120
Nelson and Salmo	446
Rossland	38,825
Slocan and Ainsworth	3,066
American Mines	186
Miscellaneous	113

Atlin District Should Have a Canadian Seaport.

Archbishop Du Vernet, of British Columbia, has published an interesting suggestion for the consideration of the Canadian authorities, the object of which is the opening up of the northern mining districts of this Province to larger and more rapid development by making feasible the provision of better transportation facilities than now are available. His proposal is best explained in his own words, as follows:

"Now that the Peace Conference has introduced us to the very sensible idea of a corridor to allow a shut-in nation access to the sea we should press the Canadian Government to secure a corridor up Taku Inlet in Alaska to allow the Atlin District to have a Canadian sea-port. A narrow strip of territory about twenty-five miles long would be quite sufficient, and as there are no settlers there at present there would be no complications, as there would be at Skagway. The shortest and easiest way into the rich mineral region of northern British Columbia (once a road were made) is up the Taku River. The Taku and Nakina rivers form almost a direct line to Teslin Lake at the north end of which is the placer gold field lately discovered. It is well-known that almost every creek in the Atlin District carries, gold, but inadequate means of transportation retards the development of the country. The Government of the United States is now in a most friendly mood towards Canada, and a greater output of gold is demanded."

Oxy-Acetylene Welding and Cutting



Rapid Repairing "On the Spot."

THIS illustration shows an operator repairing a leaky tank car right on the track, at a trifling expense by the Prest-O-Lite Process of Oxy-Acetylene Welding. Thousands of Railroads, Mines, Factories and Machine Shops have adopted this process, and are saving hundreds of thousands of dollars annually.

Costly tie-ups are avoided — valuable castings and machine parts are saved from the scrap pile — and many economies and improvements are effected both in repairing and manufacturing

Prest-O-Lite PROCESS

employs both bases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones. Provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Aparatus consists of an equal pressure blow pipe automatic regulators and gauges, and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding processes quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you Write for it.

Dynamite Explosion at Issaquah Mine.

A ton of dynamite in the powder house of the Pacific Coast Coal Company's Issaquah coal mine exploded on Saturday night, April 5th. The town of Issaquah Wn. was rocked, several mine buildings being wrecked and a number of other houses damaged. The loss is estimated as between $5,000 and $10,000. No one was injured. John Kerr, night watchman, explains that he was making his rounds and was due to register at 10 o'clock. He was nearing the powder house when he noticed smoke, and stepping closer he recognized the spitting flame of a fuse. Kerr turned and ran towards the office, reaching it just as the powder house went up. Besides shattering windows in seventy-five to one hundred houses in the immediate vicinity, the side of the compressor house was blown in. It is not thought, however, that the compressor or other machinery was damaged. The timbers at the mouth of the mine were blown down. It is suggested by the evidence that the explosion was deliberately planned and in this connection it is recalled that the Issaquah Coal Mining Company, as it formerly was known, was controlled by Alvo von Alvensleben, a German interned at Fort Douglas Utah, and who is said to have been backed by the personal capital of his Emperor. Alvo von Alvensleben, it may be stated perenthetically, has coal mining interests in British Columbia, the most notable being what is commonly known as the Jingle Pot Mine, Vancouver Island, which still is a producer.

Belmont Surf Inlet.

A report covering the operations of the Surf Inlet Mine by the Belmont Surf Inlet Company up to the end of 1918 has been received. The net earnings of the company amounted to $323,242. A loan was made to the company by the Tonapah Belmont Developing Company, amounting to $1,295,726, and interest has been paid. The average metal contents of 83,142 dry tons of ore milled was 0.481 oz. in gold; O.3114 oz. in silver, and 0.2606 per cent copper per ton, giving a total value of $924,847, or $11.09 per ton. The ratio of concentration is 11.09 to 1, making 7,498 dry tons of concentrates having a gross value of $854,537. Operating costs were seriously affected by advanced prices paid for supplies and by abnormally high labor costs. The sum of $45,569 was spent in the construction of a store, schoolhouse, and houses for employees. The dividends of 5 per cent was paid on April 15.

EDITORIAL

WEST SHINING TREE GOLD AREA.

During the past six months a great deal of publicity, much of it of an undesirable character, has been given the West Shining Tree gold area. As we attracted some attention to this area by an article in the Journal after visiting some of the properties last summer, we feel a certain responsibility for developments. While we do not approve of many of the things that are being said about West Shining Tree properties, it is still our opinion that the area is a promising one and worthy of more attention from mining men. We do not recommend it to those who are looking only for sure things, and we are not surprised that some who have looked for mines have been disappointed to find only prospects. There are great chances to be taken by those who would develop gold properties in this area. We do not regard this, however, as a sufficient reason for condemning the area. We are rather inclined to the opinon that there is a great deal of risk involved in developing mineral deposits anywhere.

A recent contribution in the Toronto Globe from a Cobalt correspondent contains much with which we agree. He points out some regrettable features of recent promotions and sounds a note of warning. He says, writing from Cobalt on May 22:

"Mining interests in this part of Northern Ontario are showing considerable interest in the advertising literature being circulated in connection with a number of mining prospects in the West Shining Tree district. It is a well known fact that narrow quartz veins were found seven or eight years ago in that district, but that the deposition of gold proved decidedly patchy, and successful mining companies dropped options which they had acquired and withdrew from the field. The attitude of companies with broad experience has been that while there might be possibilities, after extensive exploration work, or meeting with some measure of success, yet the gamble would be too great. Now comes the advertising campaign on a number of properties in that district, the campaign being conducted by a number of Toronto brokers.

"Summed up, the situation is this: The West Shining Tree district appears to be entirely speculative; behind each of the alleged leading properties are men who appear to be devoting more time to promotion literature than toward mining; the prospective purchaser of mining shares is confronted with the simple task of either placing his 'bets' on the promotions of professional brokers, or looking over the mining fields of the North more carefully, and making a speculative investment in concerns which in some instances are equipped with mining plants, and in some instances with milling plants and backed by large tonnage of "proven ore," and promoted with development work in view as a first consideration.

"There is one other phase to the situation. In the West Shining Tree district there are a number of prospectors who have toiled hard in their effort to succeed in acquiring a reward for their labors. The discoveries made have been ample to encourage these men to stick to their claims. This being so, it follows that there must also be a gambler's chance for those who would purchase shares in companies operating in the field. Further, in taking a gambler's chance, the odds are heavy, and the utmost caution is advisable.

"The greatest danger lies in the promotions being made on a basis of a large block of promotion stock being held in the hands of the promoters, and a more or less small number of shares being left in the treasury, and while the treasury shares are being sold at a stated price the promoter may also be disposing of his stock at a similar price and thus secure a great deal more cash than the amount going to the treasury of the company. Not only this, but in selling the treasury stock there may also be a rake-off in the form of a large commission to those who sell the shares."

This is a warning that should be heeded. It applies not only to West Shining Tree gold mining companies. In fact, it is not even peculiar to mining companies.

On the other hand we would call attenton to the folly of pretending that there are safe and sure ways of making profitable mines out of prospects. The risks have been great and will be so in new fields. There is very little ground for comparison between the hazard of investment in a developed, producing mine and a prospect. Those who are too timid to spend money on prospects can very well be encouraged to invest in developed mines. But the bold adventurer who seeks new fields cannot and should not be persuaded to desist because the risks are great. He should have access to the known facts, however, and be made to realize that chances of success are small. Our disapproval of the statements of many promoters arises largely from their failure to advise buyers of shares concerning the hazardous nature of the enterprise. Some promoters are undoubtedly dishonest and are endeavoring to deceive the public. They sell under false pretences and are properly classed as criminals under the code. From them we can expect nothing good. We can reasonably hope, however, that the better class of promoters will endeavor to give their clients a fair deal. To do so they must be more careful in their statements.

RE-ORGANIZING BRITISH COLUMBIA BRANCH OF MINING INSTITUTE.

The British Columbia branch of the Canadian Mining Institute is being re-organized by Mr. Mortimer-Lamb, secretary-treasurer of the Institute, who is making a tour of the Province at the present time. It is proposed dividing the existing single provincial organization into four distinct branches, representative of the following sections: Vancouver Island and district; Victoria and district; Nelson and district; Prince Rupert and district. Each will be charged with responsibility in connection with the promotion of the best interests of the mining industry within the limits of its territory. A revival of interest in the Canadian Mining

Institute's work is expected as a result of this arrangement, an outcome much to be desired, as the influence of this important organization, although it has been splendidly maintained in other parts of Canada, has languished in this province. Mr. Lamb states that attention also is being given the matter of the annual Institute meetings, which hitherto have taken place in Eastern Canada, As it has been difficult for many western members to make the transcontinental trip for a meeting of two or three days, it is proposed that there shall be an annual meeting in the west. This, it is hoped, will obviate the inconvenience of the existing condition and lead to closer co-operation, and a more healthy fraternal feeling than has been evidenced. Mr. Lamb, who has travelled across the continent recently, and has paid special attention to mining activity, says that "in every mining centre in Canada there is a revival of interest, and everything points to this great asset of the country being developed to an extent where it will be the greatest medium in paying off the war debt of Canada. Prospectors are returning to the hills, machinery is going to abandoned claims, which are known to be still rich, and capital is being advanced from many sources to help bring out the hidden wealth of the different provinces."

THE GOLD MINING INDUSTRY.

While operations are growing daily in the Porcupine district, the manner in which the Kirkland Lake field is developing, and the increasing activty in the Boston Creek district is a guarantee that the premier gold camp of the Dominion will not monopolize attention. The industrial unrest in other parts of the country is not being lost sight of, but the gold mines which are just emerging from the great economic strain caused by the war do not appear to offer an attractive field for labor to make demands which the mines could not bear. The number of mine workers is increasing steadily, and by late summer the gold mining industry in Northern Ontario promises to assume proportions greater than ever before in the country's history.

THE SILVER MINING INDUSTRY.

Beyond a few minor complaints, the Industrial Relations Committee which visited Cobalt recently appeared to be presented with no evidence that should cause alarm over the situation in that district. The high price for silver is resulting in a high average wage to the mine workers of Cobalt, on the present profit-sharing system. It is true that considerable controversy centres upon the fact that the mine operators do not recognize the union. However, in view of the expressed willingness of the operators to deal with committees representative of their own employees the danger of any serious development in industrial relations appears to be minimized. During April it is considered probable that the quotations for silver will average perhaps $1.05 or perhaps $1.06 per ounce, with some promise of it rising to an average of perhaps upwards of $1.10 an ounce during June.

GOLD TELLURIDES IN NORTHERN ONTARIO.

By A. G. BURROWS.

The Ontario Bureau of Mines has added to its equipment at the Provincial Assay Office a grinding and polishing machine and microscope for examining metallic minerals by reflected light. By means of this equipment, aided by qualitative and quantitative analyses, we have been able to recognize some minerals in ore from the Tough-Oakes mines not hitherto known to occur there or, in fact, in Canada.

Some time ago rich specimens of gold ore from the Tough-Oakes mine were obtained from Mr. C. A. O'Connell. These showed native gold, calaverite, altaite, and some black metallic minerals. These latter minerals were determined to be a telluride of gold, silver and mercury, and a telluride of mercury, homogeneous minerals under the microscope. The former telluride was analyzed by W. K. McNeill and found to contain 20.40 per cent au., 31.1 per cent ag. and 10.2 per cent hg., which corresponds closely to the formula for kalgoorlite, a precious telluride, first recognized in gold ore at Kalgoorlie in West Australia. The mercury telluride gave strong reactions for mercury and tellurium, but contains no gold or silver, and is the mineral "coloradoite." The presence of this group of tellurides associated with gold is of scientific interest in its relation to the genesis of the ore deposit, temperature and pressure of formation of deposit, etc.

While the precious tellurides are probably rare in Kirkland lake ore, there is always the possibility of obtaining them in rich bunches in the veins. The precious tellurides in the material examined are in appreciable quantities. Tellurides of gold, without preliminary roasting, would pass into the tailing in the ordinary cyanide treatment.

Tellurides occur over considerable area along the line of the T. & N. O. railway, there having been recognized, in addition to those mentioned above—tetradymite (bismuth telluride) in Beatty township, calaverite and tetradymite at Boston Creek, petzite in Maisonville and Benoit townships, and hessite in Deloro township.

DIVIDENDS FROM B. C. MINES.

British Columbia mines have distributed nearly a million dollars in dividends for the first quarter of 1919, as follows:

	Rate for Quarter.	Amount.
Granby Cons. M. S. & P. Co.	2½	$375,010.50
Consolidated M. & S. Co.	2½	261,936.00
Belmont Surf Inlet	5	125,000.00
Howe Sound Co. (Britannia)	5	99,207.00
Florence Silver Mining Co. ..	3	34,746.00
Surf Inlet Gold Mining Co...	2½	24,689.90
Hedley Gold Mining Co.	2	24,000.00
Rambler-Cariboo	1	17,500.00
Total		$962,089.40

PERSONALS.

Mr. J. P. Hubbell, of the American Cyanamid Company is in this district, having visited Cobalt early in the week, and spending the latter half of the week in the Porcupine district.

Mr. Frank L. Culver, president of the Beaver Consolidated has returned to Toronto after having spent a few days at the company's Kirkland Lake gold mines.

Mr. G. W. Dixon, of the Buffalo Mines, is making satisfactory recovery from his recent illness.

Mr. Neill, of the Cassel Cyanide Company, Glasgow, Scotland, is expected to arrive in Cobalt to-day, accompanied by W. E. Simpson.

Mr. L. N. Goodwin, of New York, was in Toronto last week, and is now at West Shiring Tree.

Renewed Activity in British Columbia Silver Areas

The strong demand for silver, and the bright prospects as to prices, are having their effect in British Columbia. In the Kootenays, the Boundary and the Portland Canal Districts properties carrying silver values are receiving attention. Prospectors are going to the hills in larger numbers than for many years. In the Eastern mining sections of the Province preparations are being made in not a few instances to re-open silver bearing properties which have been inactive. Arrangements are being made to continue work on others still in the development stage, and practically all producing mines of this character are expected to be worked to capacity this summer. In the Portland Canal mineral zone the outlook is particularly promising. The next few months are likely to see a revival in this part of Northern British Columbia, in respect of mining that will remind old timers of the old days when the town of Stewart was a flourishing mining camp, being the centre and distributing point of a district of many active mines, and with a bright future. There are those who assert that Stewart is destined to come into her own again, that this time a permanent community with an assured future will be developed, and some foundation is given this belief by the number of engineers who are going into the country, by the glowing reports being spread of certain Salmon River properties and last, and perhaps not the least, by the fact that Stewart again has a newspaper, the first issue of the "Cassiar News," "issued in the interests of Salmon River, Portland Canal, Alice Arm and Anyox Mining Districts," having come from the press a few days ago.

One of the concrete evidences of the increasing interest in silver mining properties is the announcement of the sale of the Reco Mine at Sandon, B.C., to the James Dunsmuir interests, the sum involved being reported to be $250,000. This property is located on Payne Mountain, adjoining the Noble Five Group, which is owned by Mr. Dunsmuir and associates. With the Reno Mine, which has been operated for years and has made good returns, goes a number of contiguous claims which are, for the most part, undeveloped. The new owners, therefore, now have possession of a large area which, it is understood, will be extensively developed without loss of time.

F. A. Starkey, of the Eastern British Columbia Mining Association, discussing the foregoing and other indications of interest in the silver minerals of the provincial interior, says:

"It is also known that Clarence Cunningham has taken over the Elkhorn property, which ore will be treated at his mill, newly erected at Alamo. There is estimated to be a large tonnage of milling ore at the Elkhorn, which will be of great assistance in supplying the large tonnage necessary to keep the Cunningham mill running steadily.

"Outside of these actual sales of properties we have to record the preparations for a more vigorously conducted policy of development of several properties, all of which are located in the Slocan District. The Franz Brothers, Wallace, Idaho, have just arrived to instal a full equipment of machinery for the development of their property on Ten-Mile Creek, Slocan Lake. This property is situated some five miles above the Enterprise mine, and is known as the Richmond Group, which is a dry silver property, the ore of which in its returns runs into big figures.

"James Melley, Spokane, who with his brother, Edward, owns the Blackburn Group, situated at the head of Ten Mile and the South Fork of Kaslo Creek, has left for the Slocan with the intention of opening their property, which they have owned for some 18 years. Their mine is but partially developed, but they believe it is most promising. They see the wisdom of further work in view of the present demand for silver, and hope that the property shortly will be a producer. No. 1 Tunnel on the main vein has been driven 700 feet and they have run a second tunnel some distance on the main vein with a view to striking the ore body at depth. Other veins on the property have received attention, through open cuts and general surface work. Assays taken from a stringer in the main tunnel gave values as follows: Silver, 763 oz. lead, 62 per cent. Other assays of samples taken from different points on the main vein and from surface openings have given 100 to 200 oz. in silver, 40 to 55 per cent lead, and 8 per cent zinc.

"On account of the price of silver it is most probable that the present season will see all the properties lying between Slocan Lake and Kaslo, especially such properties as those lying on Ten Mile Creek, and through to the territory covered by the South Fork of Kaslo Creek exceptionally active. Some of the properties in this section which carry high silver values are, Enterprise, Bondholder, Neepawa, Smuggler, Chief, Richmond, Blackburn, Index, Gibson, Silver Bell, Utica and Arlington."

Pumping Out Provindence Mine.

The old workings of the Providence Mine at Greenwood are being pumped out, a full crew of men being at work.

Workmen's Compensation.

Special efforts are being made by the members of the Workmen's Compensation Board of British Columbia to acquaint the miners with the terms of the legislation under which they are acting. There has been considerable misapprehension as to the scope of the Statute in regard to the payment of workmen for injuries received in their employment, the belief in many quarters being that men were entitled to financial help when becoming incapacitated through ordinary illness. This matter was before the Provincial Legislature at the last session, when the extent of the authority of the Commissioners under the Workmen's Compensation Board was explained and it was promised that some form of relief to those unable to maintain their positions because of illness, old age, etc., would be placed before the legislators in 1920. In the meantime, as stated, the Commissioners are touring the Province and explaining just what their duties are, a meeting having taken place recently between them and the miners of the Britannia Mining & Smelting Company.

Western Coal Operators Ask for Independent Board to Control Coal Industries

The Western Coal Operators' Association of Canada presented a memorandum to the Industrial Relations Commission, which is taking evidence throughout the Dominion of Canada with regard to the relations between employer and employee, advocating the appointment of an independent board to take control of the coal industry in Western Canada. "Such a Board," the memorandum states, "should, in our opinion, be made up of one man thoroughly familiar with the problems of the operators; one man familiar with the problems of the workmen; and a third with such qualifications and experience as would commend him to all as a reliable chairman. The industry has reached a point where, although permission is granted to sell coal at a given figure, it is impossible to do so on account of competition from other fields, chiefly American."

Discussion and consideration of the position of the coal industry occupied practically the whole time of the Commission on the afternoon of Saturday, May 3rd, and the operators appeared to be one in the opinion that joint councils of the employers and employed could not bring harmony to the industry at the present time because most of the miners—85 per cent of them, according to a Drumheller operator—were foreigners whose ignorance made them a prey to agitators. It might be different were the proportion of English-speaking miners large, but that was not so, and was not to be looked for as most of such had enlisted, and many of those returning were not fit to go Back to their former work. The Board of Control which the operators recommended, it was thought, should have the same power as was given W. H. Armstrong, the wartime director of coal operations in District 18, U.M.W. of A. (Eastern British Columbia and the Province of Alberta.)

W. F. McNeill, secretary of the Operators' Association; John Shanks, manager of the Brazeau Collieries; Jesse Couge, operator; and W. S. Henderson, operator and Drumheller, represented the organization indicated.

After the presentation of the coal operators' memorandum, the discussion referred to took place. W. F. McNeill stated that two mines were on strike against the order issued by the director of coal operations, but he admitted that the strikes were unauthorized by the union officials. Discussing housing conditions, witness said there were no complaints from the permanent camps, but only from new camps where bunk houses had to be used.

The markets of the British Columbia mines were in Montana and Washington, and those of the Alberta mines in Alberta, Manitoba and Saskatchewan. Freight rates hampered the operators in competing with American hard coal in Manitoba.

John Shanks, manager of the Brazeau collieries, described in detail the arrangements made between his company and employees. They were situated 120 miles west of Red Deer and six miles from the nearest village. The government leased land to the miners through the company, which erected four-room houses at a cost of about $900, and rented to the employees at $10 a month, five-room houses at $15 a month. A subsidiary company ran a store in the mining village. The desire for better working conditions was one of the primary causes of discontent, which had become acute since the war began in 1914. "Blanket men," who brought their own blankets and slept in bunkhouses formerly, now were not content with such conditions. A hospital charge of $2 a month was made, and for this a doctor was engaged, and he paid a nurse and the staff of the institution.

Men in the mines, said the witness, are not disposed to slack or neglect their work, but they have become very independent. The "labor turnover" was very large, because many young men were employed, and when they had earned a considerable sum they went away to the cities and towns.

Two operators from Drumheller gave evidence, John Henry Gouge and W. S. Henderson. Mr. Gouge declared that the cost of getting out coal was $2.53 for labor alone, exclusive of the cost of management and overhead charges. He did not think that any operator would be opposed to joint councils, but they would be unworkable, because the employees, mostly foreigners, would not co-operate with them.

Mr. Henderson employed 150 men, but had practically shut down his mine since April 1. The price of coal was high, he said, because wages had been boosted to such a level as was unfair to the operator, to the general public and to the miners themselves. "If coal can be marketed at $1 a ton less, we can compete with the hard coal in Manitoba," he declared.

Mr. Henderson stated that there were 22 mines in the Drumheller district, each of which had its own small system of lighting and its own water supply. This is expensive business, and he suggested that the government should take over the mines, instal a central lighting and central water system, and thus cheapen the cost of running the undertaking. Enough slack coal, not worth shipping, was wasted in the vicinity of the mines, to supply fuel for a power station for all the mines. Housing conditions caused improvement, but the small mines could not carry out the work required. Attemps to run the mines amicably had been made, but "foreign-born agitators had upset the whole thing by Bolsheviki talk."

E. Mart, General Manager of the Canadian Coal Company collieries, the first witness at the meeting on Monday (May 5), made a distinction between usual labor unrest characterized as a natural social reform and the radical agitators, to whom he attributed present conditions of undue unrest to some extent.

So far as cost of living was concerned in his industry, calculations showed that the advance in wages had more than compensated for the advanced cost of living. He referred to the agitator whose responsibilities were not those of the ordinary British subject, but who earned from $10 to $20 a day as one of the chief causes of undue discontent. The radicals were largely left behind when the others went to war, and found a large and fertile field among new men of foreign birth not acquainted with British government. A census of their

workmen had shown 56 per cent to be Austrians, Slavonians of the smaller nationalities and Russians.

The witness was inclined to agree, however, that the high cost of living in other lines had caused some of the discontent. Another element was the placing in strange new trades of men and women taking the places of the soldiers. Still another was the psychological condition of mind of those who had relations, fathers, sons and brothers, killed at the front. He himself had been for years and was now a member of a labor union, and he felt that one cause of trouble was the desire of men to gain authority without accompanying responsibility. The only solution was a complete understanding of both parties. The proposed industrial councils, he thought, might be a help toward educating workmen for responsibility, as well as authority to prove to them that capital is not the enemy of labor but co-relative. He had every confidence that a means could be found whereby the employees could be induced to co-operate in solving the problem. It might be difficult, but he was optimistic.

PLACER GOLD MINING IN CARIBOO DISTRICT

Reporting on his geological survey work in the Cariboo District of British Columbia last summer, R. B. MacKay, of the Geological Survey Branch, Ottawa, asserts that over 4,000 feet of the old channel of Lowhoo Creek remains to be worked.

His observations are summed up as follows:

On Mosquito Creek exceptionally high values have been obtained from the old channels, which Mr. Hopp works by hydraulicking. The gold is coarse, with portions of the original quart matrix attached. The bedrock is cut by numerous quartz veins, from which the gold was probably derived.

The Waverly, on Grouse Creek, was recently taken up by Messrs. J. G. McLaren and C. W. Moore, of Vancouver, and will be actively worked by them this summer, rich returns being expected. On Slough Creek hydraulic plants are operated by Messrs. Hopp and Joseph Wendell. On Dragon Creek Mr. L. Muller is drifting on the old channel and obtaining favorable results. Messrs. John Bell and W. Thompson will operate on Mustang Creek. The Lightning Creek Gold Gravels and Drainage Company of New York has holdings on Lightning Creek, where drilling has shown high values in coarse gold, the water problem being the difficulty. On Perkins Gulch a rich gold deposit has been found by Messrs. L. L. Felker and W. S. Sparkes, $5,000 having been recovered from a piece of ground 100 feet by 150 feet. Mr. J. A. McPherson is prospecting for the old channel of Chisholm Creek by drilling. Mr. J. F. Williams is working Boulder Creek.

At Cottonwood Canyon, on the Fraser River, the Tertiary Mining Company of Chicago is working auriferous cement by milling. At Quesnel Mr. S. J. Marsh has taken up dredging ground on Marsh Creek and has done extensive prospecting. He is arranging to install a plant. A notable result of his work was the amount of fine gold and platinum recovered. The Quesnel Hydraulic Gold Mining and Developing Company has been operating at Twenty Mile Creek, where it has installed one of the most up-to-date hydraulic plants in the province. Arrangements are being made to save the black sand and concentrates, about 1,500 pounds of concentrate carrying gold and platinum being saved daily while the plant is running. On Keithley Creek Messrs. Harrison and Worth are working an old channel, which has given rich returns, $18,000 being obtained from 10,000 square feet. The International Dredging and Drainage Co. is operating on Horsefly River. The Western Mines Exploration Syndicate of Vancouver have been drilling on Black Creek.

Mr. McKay concludes that there is a possibility of an increase in mining deep ground, and that much of the area is suitable for dredging the extension of the P. G. E. Railway into Cariboo, greatly reducing the cost of installing plants. He considers the development of a large hydro-electric power plant would do much to solve present difficulties.

EVIDENCES OF OIL NEAR VANCOUVER CITY.

Dealing with the evidences of oil near Vancouver City, Charles Camsell, of the Geological Survey Branch, Ottawa, says:

"The whole of the low-lying country on both sides of the Fraser River is supposed to be underlain by sedimentary rocks of Eocene age, though at Sumas Mountain Cretaceaus rocks project through them. These Eocene rocks, which are made up of conglomerates, sandstones and some shale, are the possible oil-bearing strata, and the rocks from which the seepages of oil have arisen. There is, therefore, very little structural evidence in the district itself on which to base conclusions as to the presence or absence of commercial bodies of oil in these rocks, though it is only to be expected that the anticlinical structure, which obtains in these beds south of the international boundray line will be found in the beds of the Fraser River district. As far as the lithology of the beds is concerned there are great thicknesses of porous sandstones capable of acting as reservoirs for oil, but so far as is yet known there are relatively few beds sufficiently thick or impervious to constitute a cover capable of preventing the escape of oil to the surface."

Mr. Camsell's conclusions are that information obtained from natural exposures and drill cores does not yet indicate that the Eocene beds contain sufficient organic material to have produced commercial deposits of oil. He does not consider there is a reasonable possibility of the oil being derived from older sedimentary rocks, as at Sumas Mountain the Eocene rests on volcanic rocks, and on the north side of the Fraser on granitic rocks, neither of which is a possible source of oil.

Thin coal seams occur in sedimentaries of the Fraser Valley, and he quotes Tyrell's opinion that oil may be distilled from coal seams that have been intruded by dykes of igneous rocks, adding: "If this theory of origin is correct the seepages have no particular significance, and a commercial oil field is not to be expected. The evidence bearing on the original source of the oil seepages, and whether or not they denote commercial bodies of oil underground, is so scanty that definite opinions can not be expressed regarding the occurrence of an oil field in this district.

Sheep Creek.

Harold Lakes, superintendent, reports that about 200 feet a month are being driven on the new crosscut tunnel on the Consolidated, Motherlode, and Nugget properties, Sheep Creek. It is estimated that the tunnel will have to go between 2,700 and 2,800 feet before it strikes the vein. It now is in about 250 feet.

Restaking of Mining Claims in Ontario

THE KNOX CASE.

A case of considerable interest to prospectors was recently tried by the Mining Commissioner of Ontario, Mr. T. E. Godson. Some extracts from the decision are printed here. Two disputes involving the same issue were tried together. Mr. J. A. Knox was disputant and Mr. Peter T. Graham and Mr. C. B. Stevenson respondents.

On the 23rd of October, 1918, Stevenson staked and on the 24th, filed his application for Mining Claims 18605-18606, 18607 and 18608, the first property being recorded in the name of Peter T. Graham and the others in his own name.

On the 13th of the same month the same properties had been staked by J. A. Knox on behalf of himself and L. T. Ieach. He made application to record the claims within the time allowed by the Mining Act, but subsequent to the time the applications of Graham and Stevenson had been recorded.

The disputes were filed by Knox against the claims on the 29th of October and the Recorder transferred them to the Mining Commissioner for adjudication under Section 132 of the Mining Act.

It is admitted Knox had propriety of discovery and staking, but it is contended by the Respondents that the land was open for staking on the 23rd of October and that Knox had, for the purpose of his staking, improperly removed used and defaced stakes placed upon the properties by previous stakers and that the claims were invalid having been staked on Sunday.

If Knox's staking is valid, having priority, he would be entitled to the claims. The whole issue is can a Licensee use and adopt abandoned stakes placed on a claim by a prior staker and remark and place them for the purpose of his staking or must he make and fashion new stakes, and is a claim staked on Sunday valid.

Certain Old Posts Can be Used, But New Ones Better.

These properties had been staked many times and been abandoned or cancelled upon forfeiture occurring. As many as twelve old posts were seen by Knox at one corner on one of the claims. With few exceptions Knox removed or remarked posts found at the corners of the claims and adopted them as his own. He knew from Alex P. Campbell the last recorded holder of one of the claims that the properties were to be abandoned and that the necessary working conditions would not be performed and suggested in his evidence that this was the reason he used posts that were upon the properties. Knox was not able to say he had used any of Campbell's posts. It would appear from the evidence he felt satisfied that such posts as he used, squared or faced and remarked were those which had been erected by the precious holders whose interests had been forfeited and whose rights to the claims had been cancelled. His examination of the posts was made at midnight with the use of what is commonly called a "bug" which consists of a candle inside an empty can, and it was necessarily a cursory one, but he was prepared to swear that any posts so re-faced, squared and inscribed were posts upon which the inscription had been entitled obliterated by long exposure or were illegible and indicated they had been standing for a considerable length of time From the evidence it would appear that Knox did not interfere with posts standing upon a subsisting claim, but that he might have done so or have removed a post on a claim which abutted the claims he was staking was a danger he was exposed to, but fortunately avoided. I am satisfied the posts he used were properly placed, squared and inscribed. His use of old markings under the circumstances of his case I think valid. I do not commend the practice or encourage its adoption, but I am unable to see that it violates any provision of the Mining Act. I see no distinction between the remarking of a post formerly used and the adoption by the staker of posts used by other holders, but upon abandoned claims. The four corner posts are evidence of the adoption of a parcel of land upon which a discovery had been made. If the claim appropriated had been allowed to be cancelled or forfeiture had occurred through non-performance of working conditions or other essential requirements of the Act, then the posts ceased to have any value and their usefulness passed with abandonment or forfeiture. The posts would no longer be the property of the holder of the forfeited interest or cancelled claim and remained only as the mute testimony of a disappointed Licensee. That the remarking of such posts is a dangerous practice is not to be denied and it behooves all licensees to stake their claims that all possibility of attack upon the ground of defective staking is not left open. The procedure required by the Mining Act is simple and uninvolved and the right way is always the best and cheapest in the end. Profitable reference may be made to Reichen v. Thompson, M.C.C., Vol. 1., page 99.

In other respects I find there has been substantial compliance by Knox with the requirements of staking.

Sunday Staking.

Knox knew from a search made at the Recording Office when the work should be done and filed and knowing that it had not been performed went to the properties on Saturday, the 12th of October, with the intention of staking the claims early Sunday morning, the 13th.

Stevenson, in his evidence, said he understood the claims were not open for staking until the 23rd of October, the day he staked, but did not state how he arrived at that conclusion. Upon the hearing his Counsel took the objection that as Knox had staked on Sunday his staking was abortive and the lands were consequently open when his client staked on the 23rd of October. I was not given any authorities upholding Counsel's objection other than a reference to chapter 104 of the Consolidated Statutes for Upper Canada, an Act to prevent the profanation of the Lord's Day in Upper Canada, now to be found in R. S. O. (1914), page 2962, and the Lord's Day Act, R. S. C., Cap. 153, Sec. 5.

I am unable to find any direct cases upon the point. It does not appear to have been raised before by predecessor in office Mr. Price, and has not been in issue in the Province of British Columbia, as the Mining Act there provides that "Any location made upon Sunday or any public holiday shall not for that reason be in-

valid, any law or Statute to the contrary notwithstanding, and a similar clause is to be found in the regulations for the disposal of Quartz mining claims on Dominion lands in Manitoba, Saskatchewan, Alberta, Northwest Territories and the Yukon.

Generally the common law does not prohibit the doing on a Sunday of any act which otherwise is lawful or render void the act so done and unless it can be said the act of staking is within the words and contemplation of either the Upper Canada Statutes or the Dominion Lord's Day Act and makes void such an Act a claim staked on Sunday would otherwise be lawful. . . . . .

Knox styled himself by the occupation a Prospector. A Prospector might be said to be one who searches for valuable mineral and when found appropriates it by the Act of staking. He also is a vendor and purchaser of mineral claims and his duties may include that of a performing assessment work upon the claims staked. He requires a general knowledge of mining and the Mining Acts that govern in the territory prospected. The Act of staking is scientific, based upon a knowledge of and in compliance with the governing Mining Laws.

The Act of Upper Canada being penal in its nature should be construed strictly and no violence should be done to its language in order to bring people within it, but rather care must be taken that no one is brought within it who is not within its express language. A prospector or one who discovers and stakes a Mining Claim does not in my opinion come within the classes prohibited by this Statute. He is not within them any more than a Lawyer or Surveyor could be said to be and he is not in my opinion a workman or laborer in the sense intended by this enactment.

Section 5 of the Dominion Act is in the words as follows:

> "It shall not be lawful for any person on the Lord's day except as provided herein, or in any Provincial Act or law now or hereafter in force, to sell or offer for sale or purchase any goods, chattels or other personal property, or any real estate, or to carry on or transact any business of his ordinary calling, or in connection with such calling, or for gain to do, or employ any other person to do, on that day any work business, or labor."

This Section is much wider than that contained in the Upper Canada Statute. It includes "any person." There is no class distinction. Then can it be said Knox as a prospector having made discoveries and staked the claims on Sunday did an unlawful act within the meaning of this Act? The foundation of a Mining Claim is a discovery and without it a staking would be abortive. The discoveries in these cases were made without work or labor. They were known to exist. In other cases they are stumbled upon by accident, again they are made after diligent search and labor, but I am treating this concrete case and as I have said no work or labor was involved n the act of discovery.

A staking follows discovery. It is imperative under the Mining Act and its effect is an appropriation of the lands on which the discovery is said to exist. Then follows an obligation to perform certain working conditions and after their completion, if the holder has maintained his Miner's License in force, a patent or lease will issue. All of the different steps leading up to patent or lease are progressive and each requirement, which is automatic, must be in compliance with the Act or a forfeiture of the rights of the holder occurs. Until a patent or lease issues, a holder is a mere licensee or tenant at will of the Crown.

By Section 78 of the Act certain periods of time are fixed for the completion of assessment work. For the first period three months from the time of recording is allowed, and for each subsequent period a full year is given. Sundays or holidays are not excluded by the Act; each day of the respective periods count against the time allowed the holder.

A Miner's License is in force for twelve months from the 1st day of April in each year. The holder is a licensee from the Crown and while such may prospect for minerals and stake out mining claims on any Crown lands open for that purpose. During the duration of the license the licensee is unrestricted as to day or time.

By the operation of the Mining Act the work on the claims in question was required to be performed not later than Saturday the 12th day of October, 1918. Failing its performance, under Section 85, a forfeiture ipso facto occurred. The lands then became open for prospecting and staking and a licensee had the privilege at the instance of the Crown to go upon the lands for the purpose of effecting or making a discovery and its adoption by staking. The next day in this case was Sunday. The property was undoubtedly Crown lands and open for staking and there was no prohibition in the license from the Crown restraining or prohibiting such an act on Sunday. There is no stay on account of Sundays or holidays with respect to working conditions and the holder is entitled to every day of each of the fixed periods of time.

There is then, in my opinion, an implied right under the Mining Act of Ontario to prospect for minerals and stake mining on Sunday. By reasonable intendment and implication the right exists under the Act and its machinery operates towards that contingency. That is the intent, I take it, of the Legislature passing the Act.

The Dominion Act contains this proviso. "Except as provided herein or in any Provincial Act or law now or hereafter in force." . . . .

The Mining Act of Ontario is an Act or law in force, and while there is no express enactment such as is contained in the British Columbia Mining Act and in the Dominion Quartz mining regulations allowing a valid staking on Sunday, there is, in my opinion, an implied intent to be assumed from the operation of the requirements of the Act that such can be done. The act of staking is a link in the chain of the different requirements that leads to title by patent or lease. . . . .

I do not express an opinion whether the staking of a mining claim is within the words, "for gain to do on that day any work, business or labor." I prefer to place the onus upon the present Mining Act of impliedly granting such a permission and with that right I feel the Lord's Day Act cannot interfere.

A Prospector who separates himself from the comforts and protection of society; blazes a trail into unknown mineral zones and discovers mineral of value is serving not only himself but the public at large, and no unnecessary restraint should be placed upon his activities. I can appreciate one such who from absence of contact for an extended period being excusably forgetful of the day of the week. I can also understand the necessity for haste when the grub-

stake is running low and the distance between the Prospector and point of supply many miles away. If the adoption of a discovery under such circumstances should result, through the operation of the Lord's Day Act, in an invalidity and loss of a supposed right, undoubtedly it would be a distinct hardship and a rather serious interference with the work of a bona fide Prospector who had gone far afield and was entitled to the fruits of his labor. On the other hand the act of one who goes to a property with the avowed object of staking it on a Sunday is not to be encouraged, but you cannot separate the rights obtained by endorsing the one and condemning the other. The Statute if it applies embraces each staking. I confess a desire to obstain from finding that to stake a mining claim on Sunday creates an invalidity through the operation of the Lord's Day Act and yet I wish to be understood that Sunday should be observed as a day of rest and calm when the mind can be disassociated from worldly tasks. Nature, however, has its own quietening influence and it provides "Books in the running brooks; sermons in stones; good in everything."

If the Dominion Statute applies then the act of staking was not "lawful" which judicially interpreted means "illegal" without authority of law in violation of duty or enjoined by law.

In Stephenson's affidavit of staking he made the following deposition "That at the time of such staking out, there was nothing upon the said lands to indicate that they were not open to be staked out as a Mining Claim and I verily believe that they were so open and that the staking out is valid and should be recorded." He knew when he swore to the affidavit that Knox had staked and was in that sense in possession of the property and there were indication that the land was not open for staking. His explanation is that while he knew Knox had staked and would record his application he understood or was advised that Knox had not staked in compliance with the Act and the lands were consequently open on the 23rd of October. The affidavit unexplained was untrue, but it could not be said to be fraudulent. Stevenson should have filed his applications and disputed after Knox had recorded. In this way any rights Stevenson had would have been protected. He no doubt honestly believed Knox's staking defective and there was no intention to deceive and no one was misled. If otherwise entitled to the Claims, Stevenson's right would not in my opinion be precluded by the affidavit of staking filed.

NEW SULLIVAN STOPING DRILLS.

Drill engineers and manufacturers have appreciated for a good many years the fact that one type of drill could not be efficiently applied to all conditions of drilling. The old two-man piston drill is now used in a relatively small percentage of conditions. One-man piston drills, water hammer drills for drifting, rotating hand feed hammer drills for sinking, and air feed stoping drills for upper holes are some of the developments of the past fifteen years.

In each department of drilling, too, specialization has been found necessary with increasing competition and with the adaptation of new drills to work previously done by other means with less efficiency. The first air feed stoping drills brought out were practically all of one type, consisting of the drill cylinder proper, mounted on a reverse air feed cylinder, in which the feed cylinder remained stationary, and the air pressure carried the drill up to its work, supported on a piston rod between the drill proper and the feed cylinder. The feed cylinder was clamped in a trunnion on a column arm, or on a bar. These machines were offered for hard, medium and soft ground and for all conditions in drilling upper holes.

The Sullivan Machinery Company was the first to introduce in this country that type of pneumatic feed in which the feed cylinder is attached directly to the pneumatic hammer, the feed piston rod acting against an abutment. This type of pneumatic feed held supremacy for many years, and in fact is considered as the standard for non-rotating machines at the present time.

Modifications of this pattern made by the Sullivan Machinery Company included hard hitting stopers for solid ground conditions, light hitting stopers for soft ground and feed cylinders of different diameters to provide a lighter or a stronger holding power against the rock.

All of the earlier types of stoping drills were rotated by hand. Demands of the past few years from the field for a successful stoping drill include the following variety:—

(1) Light weight and small size to permit easy handling in high stopes.

(2) Automatic Rotation to relieve the drill runner of the incessant labor of turning the drill bit by hand, particularly in hot stopes.

(3) Satisfactory regulation of the strength of the feed.

(4) A water jet for laying the dust when drilling in sulphur bearing ores, or other formations in which dust is injurious to the health of the miner.

(5) Automatic lubrication.

These are general, outstanding features, to which must be added in the design of a successful stoper, the usual features of convenience in handling, cutting speed, air power economy, simplicity of construction, accessibility for repairs, staunchness, and ability to resist wear and hard service.

The first four of these elements need not necessarily all be combined in the same machine, but represent varying conditions called for by different fields. The last mentioned features are essential to success in any satisfactory stoping drills.

New Sullivan Design—For the past three or four years, the drill designers of the Sullivan Machinery Company have been studying conditions and developing new features with the object of producing stoping drills to more nearly meet these varying factors of the field. That their efforts have met with success in the types quite recently introduced may be judged from the encouraging reports received as to performance and popularity with operators in many of the characteristic mining districts of the country.

Two of these new standard Sullivan stopers are shown in the accompanying illustrations. Figure No. 1 illustrates the Sullivan Class DT-44 Light-Weight Hand Rotation machine and Figure No. 2 illustrates the Sullivan Class DT-42 Stoper with Automatic Rotation and Water Attachment.

The ingenuity of the designers and the flexibility of the interchangeable part system, which is a vital element in all Sullivan Drill design permits the following combination and arrangements to suit different field conditions: :

DT-44 Light-Weight Stoper, hand rotation, direct feed, dry, solid steel.

DT-44 Light-Weight Stoper, hand rotation, direct feed, with water attachment and hollow steel.

DT-44 Light-Weight Stoper, hand rotation, with reverse feed, either dry or water type, for solid or hollow steel.

DT-42 Rotating Stoper with Reserve Feed and solid steel, dry.

DT-42 Rotating Stoper with reserve feed, hollow steel and water attachment.

DT-42 Rotating Stoper with direct feed and solid steel, dry.

DT-42 Rotating Stoper with direct feed and water attachment, hollow steel.

It will thus be seen that it is possible to furnish a stoper for practically any field conditions, as to character of ground, nature of working or class of labor, which may be encountered. The Light-Weight Stoper is, as its name implies, a small, short machine, much lighter than any other stoper ever placed on the market. Its net weight is 66 pounds, and with the feed piston drawn in, it is only 48 inches long over all. This shortness permits convenient use in the most confined stopes to direct holes at any desired point, while its low weight enables one man to carry it into narrow working places or up ladders with the least possible difficulty.

The DT-42 Self-Rotating Stoper is available for hot stopes or other locations in which the demand is for a labor-saving machine. This is the first time that a salf-rotating stoping drill of satisfactory design has been placed on the market. The difficulty with rotating stopers has been of two kinds. (1) To provide a compact, positive means of rotation and (2) to furnish some practical means of retarding the feed, so that in starting a hole or in fitchery ground the feed may be controlled, positively and immediately. The difficulty with previously designed rotating stopers has been that in these two classes of work, the forward action of the feed, combined with the rotation of the steel, would throw the bit off the inclined surface of the rock, or into the seam or vug, so that a stuck steel or a crooked hole was almost sure to result, with equally sure results in loss of time and labor and frequent damage to the drill itself.

In the Sullivan Rotating Stoper, the rotating mechanism is of the same type, which has proved so successful in Sullivan DP-33 Rotator Hammer Drills and in the Sullivan DR-6 mounted water hammer drills. In this design, an extension bar, forming an integral part of the piston proper at the front end of the drill, is milled with alternate straight and spiral flutes or grooves, which engage a ratchet collar and a retaining bushing, the latter being screwed into the chuck bushing and transmitting the rotating movement to the drill steel on the return stroke of the piston.

The piston delivers a free blow on the drill shank, the ratchet turning with it. It will be noted that the parts comprising the rotation are all at the front end of the tool. There is no separate rifle bar and the piston is not weakened by a hole bored in the rear end to receive that part, as is necessary with rifle bar rotation. Experience with these new stopers, as well as with the standard hammer drills referred to above, has demonstrated that this form of rotation is substantial, positive and reliable.

The builders state that in their experiments with independent rotating motors mounted at the front end of the machine, it was found that the increased weight at this point caused the machine to be very unwieldy, due to improper balance. The present standard arrangement while it lengthens the machine, permits a good balance to be maintained, which enables it to be handled a great deal easier than would be the case if the extreme front end were over-weighted by a bulky mass of metal.

The second element in the satisfactory rotating stoper, namely, control of the feed, has been the result of much study and experiment and is provided in these machines by means of a hand retarder or brake.

THE MERCURY DEPOSIT AT SAVONNA.

Discussing the mercury deposits at Savonna, British Columbia, Charles Camsell, representative in British Columbia of the Geological Survey Branch, Mines Department, Ottawa, states in his annual report that these deposits occur at intervals along a belt 25 miles in length extending from the west end of Kamloops Lake northward to Criss Creek and southward to Tunkwa Lake.

The British Columbia Cinabar Company, operating in 1896, produced 10,557 lbs. of mercury from 150 tons of picked ore. The company expended over $100,000 in development, mining and retort plant for high-grade ore, followed later by a plant to treat the lower-grade ore. The latter was not a success, due to the losses in the furnace and not to the low grade of the ore. Mr. Camsell was of opinion that these deposits could have been profitably worked on the high prices for mercury ruling during the war. The grade of these deposits compares favorably with the mercury deposits of California, so that there is a prospect of the industry being revived and quicksilver added to the list of metals entering into the annual mineral production.

Mr. Camsell notes other localities where mercurial ores have been discovered, as Silver Peak, near Hope; Sechart, on Barclay Sound; the Kicking Horse River at Field and Golden; Boston Bar, on the Fraser River; Homatheo River, at the head of the Bute Inlet; Lillooet. Dr. V. Dolmage, of the Vancouver office of the geological survey, examined the Sechart deposit last summer, and reports finding considerable metallic mercury in the old dump, but none in freshly-collected specimens. The mineral occurs in a shear zone 20 to 50 feet wide, and Dr. Dolmage states that "with properly conducted prospecting an orebody of economic value might possibly be developed."

THE GUN CREEK COPPER DEPOSITS.

In his report on the Gun Creek, Copper Mountain, deposits, Charles Camsell, Dominion Geologist, makes some interesting observations relative to this property which, it is reported, has been bonded and is likely to be extensively developed. In regard to transportation he states that a railway following the valleys of Bridge River and Gun Creek would be eighty miles in length.

Copper Mountain has an altitude of 8,000 feet, and the valley bottom above the 6,000 contour line shows the bedrock well exposed. The ore-bearing formation is grano-diorite, with inclusions of stratified rocks. The grano-diorite is intruded by a grey diorite porphyry. The greatest amount of mineralization is in a fractured zone traceable up the mountain for a distance of 1,000 feet or more, and with a width of from 500 to 600 feet. This zone is traversed by numerous porphyry dykes. The fracture lines are filled with narrow seams of quartz and calcite, carrying pyrite, chalcopyrite and sometimes magnetite. Other zones

of fracture showing similar mineralization occur both north and south of the main zone. Samples indicate that the silver is an important constituent.

Mr. Camsell notes that owing to the geological conditions, other deposits of metallic ores may occur in the neighborhood, stating: "The deposits are situated on the eastern border of the great coast range granodiorite batholith, where this batholith is in contact with stratified rocks of both sedimentary and volcanic origin, and experience has already shown that it is under such geological conditions that a great many of the deposits of metallic ores of the North American continent occur." Of the Gun Creek Copper Mountain deposits Mr. Camsell concludes: "The nature of the deposits and the large area over which sulphide mineralization extends would suggest the possibility that a large low-grade copper deposit might be developed which could stand the heavy expenses which must be incurred before the stage of actual production is reached."

OVAL-SHAPED ELECTRIC FURNACE.

Electrical furnaces were first placed in commercial operation in this country 11 years ago, and since then many types have been designed. Among recent types to be developed is the Vom Baur furnace, which is manufactured by the T. W. Price Engineering Co., New York. The shell is made of steel and is lined with firebrick, the periphery of which assumes horizontally an approximately oval shape of such dimensions that an equal heat gradient is obtained at the intersection of the slag line and furnace hearth. The arched roof is reinforced with steel girders through which the carbon electrodes enter the furnace.

Two counter-weighted doors with water-cooled frames are provided. The furnace proper is fastened to two heavy cast-steel rockers which roll on horizontal bed-plate castings anchored to the foundations. One side of the rockers is geared and engages a rack in the bed-plate casting to insure non-slipping and an even tilting motion. The tilting motion of 29 degrees in one direction for pouring and 5 degrees in the other direction for removing the slag is applied by means of rocker arms fastened to heavy-steel wheels. Power is applied to the latter through spur and self-locking worn gearing which is actuated by means of a variable-speed motor equipped with a solenoid brake.

How the Heat is Produced.

The electric heat is produced in the furnace by means of arcs at the ends of the electrodes, the inmoving the electrodes up or down, thereby lengthening or shortening the arcs. The centre electrode is larger and carries approximately 41 per cent more electrical heat than either end electrode. The high-tension power line is connected to the transformers and the low-tension is conveyed to the electrode clamps by means of copper bus bars and flexible cables.—Iron Trade Review, April, 1919.

LE ROI, No. 2.

Interesting remarks in connection with the mining situation in British Columbia, and especially in regard to the Le Roi No. 2 mine at Rossland, were made by the chairman of the company, Lord Ernest Hamilton, at the annual meeting of Le Roi No. 2, Limited, held recently in London.

In this regard Lord Hamilton said that the conditions with which they had had to contend during the past twelve months had been extremely difficult. Their chief difficulties had been with regard to the smelting of their ore. At one critical period the smelter to which the company had regularly sold its shipments entirely declined to accept the ore on the ground of their own labor troubles. The smelting contract expired after the declaration of war, and the smelter refused to sign a new contract, but agreed to take the company's ore with such qualifications as might be forced upon them from time to time by labor or market difficulties. At one period the smelter's labor difficulties were so severe that they were unable to take any of the company's ore, and the directors therefore arranged for temporarily shipping it to other smelters, but the terms obtained were less favorable on account of the higher freight. After a time, when shipments were resumed to Trail, the terms were less favorable than those formerly enjoyed. All this militated seriously against the profits at the mine. In addition to those troubles, labor was very scarce, and very difficult to obtain, while the necessary supplies and materials were very much more expensive.

The actual mining operations themselves had been successful, and the same might be said of development work. Important discoveries had recently been made in that part of the property which was known as the No. 1 mine. Ore bodies of considerable promise had been located. These had hardly reached the productive stage at the end of the financial year, but they had since played an important part in ore production.

Sinking on the South Rodney vein had been resumed at the end of the year, and had since been further continued down to the 1,950 foot level, at which level exploration was in progress. Shareholders could hardly expect him to make any prediction with regard to the mine outlook at such a moment as this. All that he was in a position to say was that the mine looked well, and that if pre-war conditions existed prospects would be much more favorable. All they could do was to carry on mining operations on sound and recognized principles, and to hope for an improvement in smelting facilities and for a corresponding reduction in the cost of labor and materials.

C. H. Stewart said that the chief feature of development was the finding of high-grade ore in the No. 1 vein, which was to be identified with the War Eagle vein, west of the fault which dislocated it. Progress had been made since the end of the financial year, and it had become the principal producing stope. The stopes were full above the 600 ft. level. Work was at and above the 400 feet level, in progress to prove the existence or otherwise, of an upward continuation. It was not possible to resume the sinking as to the deep ore body for exploration of this until the close of the No. 1 vein having been successful of the year, but the winze had now reached the 1,950 foot level, where it had got clear of the intrusive dyke into favorable mineralized ground, and it was hoped that the westerly drive and crosscut at that horizon would find the downward continuation of the ore body, which had been so productive in the upper level.

As to the production since the end of the year under review, shipments in the first five months of the current year had been 7,500 tons; receipts had been $82,000, and costs $56,000, but the value of ore in transit at this moment was $10,600 less than it was at the close of the year. The last month's returns showed an improvement in grade. Settlements had been preliminary and partial, for since the armistice there was no official quotation for copper as defined by the smelter tariff.

Special Correspondence

NORTHERN ONTARIO.

Keeley Mine Re-opened.

After lying in idleness for the greater part of the past four years, the old Keeley mine, situated in the South Lorrain district, is to resume work within the week. Plans have been completed toward this end. Perhaps no other mine in the north has received quite so much notoriety as has the Keeley, due, not so much to the amount of silver which it has yielded, but, rather, to the fact that it was on this property where silver was first discovered which caused the rush to South Lorrain, and, later, the mine having figured in and having been partly responsible for the failure of the Farmer's Bank some years ago.

The mine was held under option by British interests at the outbreak of war, and an extension of time was given, to hold good "until one year after the war." At that time it was not expected that such a war could be waged for more than a few months; hence the long period of inactivity.

Palmer-Paine Co. Will Work Gowganda Property.

The Palmer-Paine Mining Company has been organized and will operate the property formerly operated by the T. C. 177 Mining Company, situated in the Gowganda district. The property adjoins the Miller Lake O'Brien as well as the Castle property of the Trethewey Company.

During the course of previous work a shaft was driven to a depth of about 210 feet. Arrangements have now been made to carry this work to a depth of 500 feet, at which point lateral operations will be conducted. N. R. Morrison is in charge of operations.

Installing Plant on Clifton.

A plant is being installed on the Clifton-Porcupine property, in the township of Deloro, and is expected to be ready for operation within the month. Ample finances, it is stated, are now in the treasury to assure the carrying out of a more or less extensive exploration and development campaign. A good deal of spectacular ore was opened up on the property some years ago.

Hurricanaw.

Navigation for river boats has opened on the Hurricanaw River, making boat travel possible from Amos on the railway to the centre of mining activity in the vicinity of the Indian Peninsula, as well as the Martin, and the Cisco mines.

Miller-Independence.

A special car is scheduled to leave Dayton and Germantown, Ohio, for Boston Creek. The car will carry a number of shareholders of the Miller Independence Mines, among whom are a large number of leading business men of both Dayton and Germantown. The party, it is stated, will arrive at the mine on May 26th.

Satisfactory progress is being made in the development of the mine. Also plans are being drafted for the proposed new 100-ton mill, the necessary finances having been provided for by the sale of a block of treasury stock at $4 per share.

The Miller-Independence Company is in the happy position of having the comparatively low capitalization of $700,000 divided into 700,000 shares with the par value of $1 each. Of this, some 500,000 shares were previously issued. About 50,000 of the remaining 200,000 shares are being sold, the block having been already pretty well subscribed for at $4 per share. It is now believed it may not be necessary to dispose of the remaining treasury shares in order to bring the mine to an important producing stage. This situation holds out great promise to the present shareholders.

Rapid Progress at Tough-Oakes.

During the second week in May the Tough-Oakes continued to make rapid progress. For the seven-day period the underground workings were extended 299 feet, or at the rate of close to one-quarter of a mile per month, thus setting a new high record.

The new vein opened up during April has been further developed and gives promise of adding considerably to tonnage. Also, cross-cutting at the 400-ft. level is proceeding at a rate that should result in reaching the vertical shaft on the Burnside, and thus make that shaft available for lowering and raising men engaged in these lower workings, both on the Tough-Oakes side as well as on the Burnside.

McIntyre Making Larger Output.

The McIntyre-Porcupine bine is now producing at maximum capacity, and is expected to wind up its fiscal year, ending June 30, 1919, with a record of 180,000 tons treated during the period. With mill heads having maintained an average of about $10 to the ton, it follows that the year's production should amount to about $1800,000. It is expected the margin of profit will be almost equal to one-half of the total output, or about $800,000.

During the year the McIntyre has disbursed three dividends, each amounting to five per cent, or a total of about $541,000. With this fact in mind it is expected an amount in the neighborhood of one-quarter of a million dollars may be carried to surplus. The surplus as of June 30th, 1918, amounted to $872,172.75, and the amount added this year should increase the surplus well beyond the million dollar mark.

A force of about 348 men and 48 machines are employed, constituting the largest force ever before engaged by the McIntyre. The main shaft is being continued from the 1,000-ft. to a depth of 1,375 feet, where a second main haulage will be installed. With the work well under way at the 1,375 ft. level, the main shaft will be continued to still deeper levels, and will thus become the deepest operation so far undertaken in the Porcupine camp.

Will Maintain Gowganda Road.

The Journal has been informed that the Ontario Government, following the completion of the macadam road from Elk Lake to Gowganda, will also provide for the maintenance of the road. It is proposed to engage an expert road builder for the work of construction, and the work will be under the direct supervision of Mr. Fullerton of the permanent staff of the government. The method of maintenance will consist of keeping one man engaged during the summer months, and equipped with a two-ton truck so as to repair any small breaks that may occur in the road surface. In this manner no difficulty in keeping the road in first class condition is anticipated. The Government will also provide for oiling the road at least once a year.

Speeding Up Work at Dome Mine.

With a force of between 250 and 300 men employed, the development of the Dome Mines is being gradually speeded up, and has now assumed large proportions.

It is planned to mill ore of an average grade of $7 per ton during the period occupied in getting up to capacity. While running for a time at the rate of 600 tons daily, it is expected, costs will amount to about $3.50 per ton. Later on, as the capacity is gradually increased to full, or 1,350 tons daily, the mill heads will be gradually lowered, until they ultimately reach the average throughout the mine, which is about $5.10 per ton. Operating at full capacity, it is learned, the costs should be reduced to between $2.75 and $3 per ton, as compared with $2.50 before the war. Therefore, the margin of profit is expected to amount to about $2.25 per ton when operating at full capacity and would be well in excess of dividend requirements at the former rate of 20 per cent annually.

Rich Ore Discovered at Chambers-Ferland Mine.

An important development has just taken place at a depth of about 300 feet on the Chambers-Ferland property of the Aladdin-Cobalt Company. Several rounds have been taken out of a vein averaging about six inches in width and containing silver values of about 2,000 ounces to the ton. The discovery occurred at a time when it was generally understood the old mine was about worked out, and when low grade ore was being shipped preparatory to cleaning up ready for curtailing operations possibly some time next winter.

There are indications that the present high grade ore shoot may be quite extensive. The shipment of low grade ore from other parts of the mine is proceeding at the rate of about twenty-five tons daily.

Silver Found on Farragh Property.

On the property formerly known as the Farragh Mining Company, situated in the township of Coleman, on the north side of the Kerr Lake Majestic property, a vein has been discovered in which silver ore is found to contain several thousand ounces to the ton. The vein occurs in keewatin formation, at a point where the keewatin extends into the diabase. The vein crosses the sixty-foot tongue of keewatin, and continues in the diabase. At the point where the high grade silver ore was opened up the vein is from four to five inches in width, composed of calcite, cobalt and native silver.

The property was formerly owned by the Farragh Mining Company, and was sold at auction a few months ago to Pete Farragh, for $10,200.

Ontario-Kirkland.

Exploration and development work on the Ontario-Kirkland property is being carried on at the rate of about 500 feet every thirty days, according to official information. An average speed of about 17 feet daily has been attained. With the completion of the shaft to a depth of 300 feet, a cross-cut was driven, and at a point 30 feet from the shaft the No. 1 vein was encountered, showing a width of about five feet of commercial ore. Drifting toward the west is under way, and values are increasing, visible gold being present. Also, the cross-cut is being driven toward the No. 2 and No. 3 veins, which parallel No. 1 in comparatively close proximity.

Adanac Ore Will be Treated at Temiskaming Mill.

The management of the Adanac mine has made arrangements with the Temiskaming Mining Company to treat a large tonnage of medium grade ore in the mill of the latter company, the arrangement being to treat Adanac ore in 500-ton lots.

At the same time the high grade ore encountered during the course of work will continue to be bagged.

Government Prospecting Parties.

Members of the Canadian Mining Institute are being urged by H. Mortimer-Lamb, secretary-treasurer of that organization, to support representations which have been made to Sir James Lougheed, Minister of Soldiers' Civil Re-establishment, asking for the establishment of a prospecting expedition headed by returned men, to explore and investigate the mining possibilities of these parts of the Dominion, of which little is known.

The suggestion is that the government should utilize returned soldiers in the work of searching for mineral under the auspices and direction of the Department of Mines. It is recommended that suitable territory should be selected in different parts of Canada, and that each section so chosen and defined be placed in charge of an officer of the Department, whose duty would be to act as general supervisor of the work of the exploration parties. Each of the parties would be under a mining engineer who is a returned soldier, and the personnel of each expedition would be made up of returned men who are qualified for the work of prospectors.

Mr. Lamb further explains the idea as follows:

"After making a discovery an officer of the Department of Mines would investigate it and upon his recommendation it could be opened up. If the showing is found to be promising the Government would invite the larger exploration companies to send their representatives to make an examination and give them an opportunity to secure a working bond on it with the option to purchase.

"Of the monies realized from the sale of properties, 75 per cent would be retained by the government and would go towards defraying the expenses of the explorations, while the remaining 25 per cent would be divided among the members of the party responsible for making the original discovery. This latter provision is suggested as being not only a fair one, but as as an incentive to activity on the part of the men who enter this service."

Cobalt Views on Shining Tree Area.

Among the representative mining men in the precious metal mining fields of Northern Ontario, considerable discussion is heard relative to the situation in the West Shining Tree district where a number of professional promoters are advertising stock in prospects at prices for which shares in proven mining concerns may be purchased. The tendency on every hand appears to lean toward advising caution when delving or speculating in propositions where the older established mining concerns have hesitated to venture, after having made investigation. Not much real development work has yet been done on the promisng prospects found in the West Shining Tree field, where the deposition of gold is found to be spectacular at times, but is decidedly patchy.

Important Development at Nipissing Mine.

One of the most important developments met with in the Cobalt district during recent years, is the huge oreshoot opened up in vein 109 on the Nipissing mine. So far about 170 feet of drifting has been done, and the average silver content of the vein is high.

Some of the most optimistic statements made on the street are to the effect that the vein averages four inches in width and may be expected to be at least 100 feet in depth, and contains average values of about 6,000 ounces of silver to the ton. This would point toward there being about 3,600,000 ounces of silver in the shoot. While this report is probably over optimistic, yet it is interesting to note an official statement made in the Journal last week that the vein had then been drifted on for about 130 feet and had averaged about two inches in width of 3,000 ounces ore. Should this shoot prove to be 100 feet in depth it would contain about 1,500,000 ounces of silver.

The Nipissing management has always been noted for being very conservative when estimating ore, and while the reports that 3,600,000 ounces have been placed in sight may be somewhat high, yet it is a fact that the shoot is exceptionally large and may reasonably result in the company redeeming its former position as regards ore reserves as of the close of 1917 which were about 8,000,000 as compared with a decline to about 6,000,000 ounces at the end of 1918. In doing this the company is making still more secure its position of being the leading silver mine in the British Empire.

Resume Work at South Lorrain Mines.

Arrangements have been made to resume work at the Pittsburg-Lorrain and the Wettlaufer mine in South Lorrain. It is planned to re-open the mill of the Wettlaufer, which is under lease to the Pittsburg-Lorrain.

The present plan of operation does not include underground work, but is confined to the retreatment of the tailings dump from previous operations. Horace F. Strong will manage the operation.

Business men of South Porcupine are planning a more or less extensive building program, following the loss of a score of buildings in the fire which swept the western part of the town recently.

Kirkland Lake Gold Mines.

The Teck-Hughes is now producing at about full capacity. During the month of April a total of 2,602 tons of ore was treated, containing an average of $10.46 per ton, according to official advice. This appears to indicate a production of $27,216.92. The mill treated an average of upwards of eighty-six tons of ore daily.

With the Lake Shore mine having produced $44,781.56 in April, the Teck-Hughes having produced $27,216.92, and the Kirkland Lake Gold Mines producing about on a par with the Teck-Hughes, it is evident these three mines are now producing at the rate of about $100,000 every thirty days. That this output will be gradually increased within the next few months is probable.

In the meantime the Tough-Oakes is developing ore at a rapid rate and will reopen its mill some time during the summer, and the Wright-Hargreaves is proceeding with the construction of a large new mill. These two mines will be producing in a big way before the close of the year, and it is calculated the combined output of the mines of the Kirkland Lake field will aggregate about three million dollars during 1920.

In addition there are a number of smaller mines that should in due course add to the output. First is the Kirkland-Porphry where the erection of a mill is already warranted. Second is the La Belle-Kirkland where a large tonnage of commercial ore is in sight and where operations may be resumed before very long. Third, is the Ontario-Kirkland where very favorable results are now being met with a depth. Fourth, is the Canadian-Kirkland, the property recently acquired under a working option by the Crown Reserve Mining Company of Cobalt.

In addition to these are a large number of promising prospects upon which considerable exploration work is being carried on.

Catherine Township Claims.

Arrangements have been made to explore the Angus and the Bent veteran claims in the township of Catherine, in the Boston Creek district. A small force of men have been taken in for the purpose.

Adanac.

The scope of operations at the Adanac mine is being enlarged, a third machine having been set to work this week for the purpose of opening up the main vein system at the 200-ft. level. Heretofore, the greater part of the work done has been at the 310-ft. level, and at which point a considerable quantity of low grade ore has been opened up, and several tons of high grade ore has been bagged. Following the arrangement recently concluded with the Temiskaming Mining Company, the Adanac will begin shipping ore early next week to the Temiskaming mill for treatment. The content of the large tonnage to be treated will be returned to the Adanac in the form of concentrates following which the concentrates will be disposed of to the smelters.

Indian Peninsula Mill.

The new mill on the Indian Peninsula mine of the Penn-Canadian Company has been completed, and is now understood to be in readiness for operation. Early in June, it is planned to commence production. The Indian-Peninsula is a molybdenite property, situated in north-western Quebec, about twenty-two miles south from Amos on the Transcontinental Railway. The property was formerly known as the St. Maurice Mines. Mr. W. F. Haines, president of the Penn-Canadian as well as the Indian Peninsula has just concluded a visit to Cobalt, and although it is quite evident the market for molybdenite is more or less limited at the present time, yet the probability of a rapidly improving situation is good, and Mr. Haines appears to be very confident as to the future of the mine.

Exploring Hohenaur Property.

Exploration work has been resumed on the Hohenaur property, formerly held under option by the Temiskaming Mining Company up to the time of the change in the control of the latter company. At the time the Temiskaming dropped the option held on the Hohenaur, a plant had been installed at the expense of the Temiskaming. This plant was left on the property, adequate reimbursement being made to the Temiskaming. H. Cecil and S. Renaud are behind the present program of operations.

Chambers-Ferland.

As a result of the recent strike of high grade ore at the Chambers-Ferland mine of the Aladdin-Cobalt Company, upwards of sixty sacks of high grade ore have already been bagged, and a considerable tonnage of mill rock has been opened up. Further work is proceeding along the vein, and the outlook for additional high grade is stated to be quite promising.

Ontario Kirkland.

According to official advice to the Journal, the No. 2 vein has been cut at the 300-ft. level of the Ontario-Kirkland property, at which point the vein shows is said to be well defined and apparently well mineralized, although assay results have not yet been ascertained.

The manner in which the veins of the Canadian-Kirkland are developing at the 300-ft. level, particularly the No. 1 vein, has led the management to consider the advisability of installing a mill later on in the year. The trend and result of developments during the next few months will probably decide the course to be taken.

Greene-Kirkland Gold Mines.

Among the new companies formed for the purpose of operating property in the Kirkland Lake field is the Greene-Kirkland Gold Mines, with a capitalization of $3,000,000 divided into 3,000,000 shares of the par value of $1 each.

Miller Independence.

In the "D" or incline shaft on the Miller Independence Mines at Boston Creek, drifting operations are again under way. It is planned to develop as much ore as possible at this level so as to provide tonnage for the 100-ton mill which the management has decided to erect. In the meantime, diamond drill operations are making satisfactory headway from the 200-ft. level of the new central shaft. It is expected the main vein will be tapped at a vertical depth of about 300 feet.

Lake Shore.

The Lake Shore mine produced $44.781 during the month of April, according to official information. The mill ran 96.6 per cent. of the possible running time, reducing 1,800 tons of ore and recovering $24.88 per ton, or an average of $1,492.72 daily.

This compares with an average daily output of $1,463 in March, during which period the ore averaged $24.46 per ton.

Canadian-Kirkland.

The shareholders of the Canadian-Kirkland Gold Mines Company will hold a meeting in Haileybury May 28th, for the purpose of considering, and if approved, ratifying an option agreement whereby Sir John Carson, representing the Crown Reserve Mining Company is given an option on 800,000 shares of the Canadian-Kirkland Company on a working option basis. Also, the shareholders will be asked to ratify a by-law recently passed by the directors authorizing the sale of 400,000 shares of treasury stock at 25 cents per share.

The Crown Reserve Company has already started work on the property, and the situation points toward the probability of the shareholders ratifying the deal on Wednesday.

Temiskaming.

It is understood in usually well informed circles that prominent interests in the Temiskaming Mining Company still entertain hopes of being able to secure the Dolly Varden Mine, in British Columbia, despite the fact that the Taylor Engineering Company have been reported to have outbid the Temiskaming.

Whereas the Temiskaming bid $900,000 for the Dolly Varden, it is understood the Taylor Engineering Company has bid $1,100,000. On just what grounds the Temiskaming interests base their hope of still competing successfully for the Dolly Varden has not been made clear. There even appears to be many reasons for hesitating to share such a hope, in the light of the trend of events during the past few months.

Silver Leaf.

The annual meeting of the Silver Leaf Mining Company will be held in Toronto on June 6th for the transaction of business that may properly be brought before the meeting.

May Reopen Hylands Property.

The reopening of the old Hylands property, lying between the Ophir and the Gifford Extension properties, is under contemplation and arrangements are expected to be concluded within a short time. It is understood a number of business men who are interested in the property have arranged for the necessary finances.

The geology on the Hylands is said to be favorable, the formation being keewatin overlying diabase. On the north side of the property the distance down to contact is not far, but the contact dips quite sharply and reaches a depth of perhaps 400 feet at the southern boundary.

Berry Claims Optioned.

Interests close identified with the McIntyre-Porcupine Mining Company have secured an option on the Berry group of claims in the Kirkland Lake gold district. The Berry group are situated along the boundary between the townships of Teck and Lebel, and adjoin the Burnside mine on the south. The property consists of five claims comprising a total of not far under two hundred acres.

It is interesting to note that the McIntyre-Porcupine is the first important Porcupine mining company to interest itself in the prospective area of the Kirkland Lake district. Perhaps no other mine in the Porcupine fiel dhad a greater struggle to succeed than did the McIntyre on its Porcupine property. For many months at one point of development it appeared as though the proposition would go down as a failure. Perhaps the two chief reasons why the McIntyre did not experience such a fate was the fact that it was backed by such a competent man as the late Col. A. M. Hay, and with the work being done under the management of the present manager, R. J. Ennis. The company's entry into the Kirkland Lake field, although yet only to the extent of holding an option on an important group of claims, shows the aggressive policy of the McIntyre. Having firmly established itself as the third largest gold mining concern in the Dominion, it is evidently not the intention of the company to limit its ambition even to its present very favorable position.

BRITISH COLUMBIA.

Granby.

The last quarterly dividend of the Granby Consolidated Mining & Smelting Company was at the rate of $1.25 a share, amounting to $187,481, and making a total of $11,136,367 paid in 20 years.

Florence Silver.

The Florence Silver Mining Company operating in the Ainsworth, has mailed cheques for its monthly dividend (April) of $17,650. The rate is 1½ cents a share. Total disbursements amount to $35,500. In future disbursements will be made on the quarterly basis instead of the monthly system.

Gold Discovery at Terrace.

William Dahl, of Terrace, B.C., states that he has found free milling gold in paying quantity on a property which he and his partner have been developing for the past nine years in the vicinity of Terrace. A tunnel has been driven 180 feet, in addition to considerable stripping and surface work. The veins uncovered run from 18 inches to 14 feet in width, and the general average of the ore is said to return about $10 a ton. Seven claims, which are known as the "Lucky Seven," have been staked. A handsome specimen taken from the lower workings is on exhibition at the rooms of the Vancouver Chamber of Mines.

Geological Survey Work in B. C.

The season's work of the British Columbia Branch of the Geological Survey, Mines Department, Ottawa, commences this month. It will be conducted under the supervision of Charles Camsell, the well-known Canadian geologist. Several new fields are to be subjected to geological investigation and examination. One party at least will be sent to Northern British Columbia, and it is likely that the Alice Arm and Salmon River sections will be visited and reported upon. Nothing definite is yet known as to the policy in regard to the continuance of the investigation of the Tulameen platinum deposits.

Smelter Rates Enquiry.

The report of the special committee appointed to inquire into the justice or otherwise of the custom rates charged by the Consolidated Mining & Smelting Co. of Canada at its Trail (B.C.), Smelter, is expected to be available shortly. Messrs. S. S. Fowler, Ivan DeLashmutt and James Anderson, who constitute the personnel of the Committee, recently held a conference with Mr. O. R. Whitaker, the Colorado metallurgical expert, who has been employed to give technical advice, and the latter's findings are looked for in the near future.

Ore Receipts at Trail.

For the first four months of this year, some 65 mines contributed a total of 124,894 tons to the gross total of ore and concentrates received by the Consolidated Co. in Trail. This compares with 140,157 tons in 1918, and 146,395 tons in 1917 for the same months (four) respectively. Considering metal market conditions, which in the case specially of lead and copper, have been most chaotic, with almost no call for either metal, and then at nominal figures, the showing is encouraging, to say the least.

No ore whatever is being received from American mines, and comparatively little from mines in British Columbia other than those owned and operated by the consolidated concern itself. In fact, the tonnage from the company's own properties comprise about 86 per cent. of the total received thus far this year.

Metals still continue to pile up at the refining works in Trail, or are stored in other central points awaiting a market of some sort. However, no one can tell what that market will be when a demand does appear. It is hoped that this will eventuate in the near future to relieve the situation. Thus far American sellers have been able to dump their lead in the Canadian market at any price that could be obtained.

For purposes of comparison herewith is given the monthly tonnage ore receipts at Trail smelter, separately, for the last three years.

	1917.	1918.	1919.
January	36,570	27,404	35,283
February	40,967	33,989	30,450
March	42,949	41,725	30,809
April	25,909	37,039	28,352
Totals	146,395	140,157	124,894

Miller-Independence.

It is understood that a number of the directors of the Miller-Independence Mine and other shareholders from Ohio will shortly visit the mine at Boston Creek.

The directors are Geo. J. Miller, president; Wm. Stroop, vice-president; J. C. Schaeffer, secretary; Ed. Rettich, treasurer; Geo. W. Ozias, Judge O. B. Brown, Adam Begard, Frank Groch and J. A. Read.

Canadian Collieries Wins Case.

Judgment has been given in favor of the Canadian Collieries (D), Ltd., against the Pacific Coast Coal Mines in the action brought by the former for trespass and for the taking from its property without authority of a quantity of coal. Mr. Justice Murphy has allowed the plaintiff company damages of over $85,000. The defendant company's answer to the allegations mentioned was that the boundary marked and accepted was not the true boundary and that, apart from this point, it had permission from the late Mr. Coulson, manager of the Wellington Collieries at that time, to remove the coal in question. That the coal was taken was not disputed. The contention as to the boundary not being accurately shown on the map, the judge observes, was not very seriously upheld. The main defence as to the coal having been removed by Mr. Coulson's permission he has been forced to find "with great reluctance" not proven. His Lordship points out that the only man who could have contradicted this statement is dead. "I think the plaintiff's case is made out that there was a deliberate taking of coal with knowledge that it was beyond plaintiff's boundary line," remarks the judge in conclusion. He fixes damages at the rate of $3.25 a ton for 25,066 tons removed, and 15 cents a ton for 23,516 tons of coal left in place, but which is now valueless. The case, no doubt, will be appealed.

The Supreme Court of Canada has just handed down judgment in a case of a similar nature, in which the Canadian Collieries (D), Ltd., and the Pacific Coast Coal Mines figure as the principals. In this the latter have been ordered to pay $64,097.70 to the former as recompense for trespass and the removing of coal without authority. The Pacific Coast Coal Mines appealed from the Appellate Court of British Columbia to the Supreme Court of Canada, but the latter court has dismissed the appeal with costs, without hearing argument from respondents' counsel.

The Fires at Princeton Mines.

Ernest Waterman, general manager of the Princeton Coal & Land Company, is making every effort to establish the identity of the party or parties responsible for the fires which damaged the company's storeroom and destroyed the hoist at the mines on the morning of April 25th. For a time there was a suspicion that some of the strikers, who formerly were employed on railway construction near Princeton, were responsible. This theory is not now credited. It is said that there have been three fires at the mine in the past year, all apparently of an incendiary origin. On at least two occasions some of the fire hose was found to be cut and the hydrants tampered with. In the hope of solving the mystery and removing these annoyances by the apprehension of the guilty ones, Mr. Waterman has announced that the company will pay $500 for the necessary information and the police are making a special effort.

Surprise Mining Company.

Development operations are reported to have proved a considerable body of milling at the Ivanhoe Mines of the Surprise Mining Company, and there is a possibility that the Rosebery Surprise Mill at Sandon will be reopened.

Paul Lincoln, of the Noble 5 Mines, has returned from Salt Lake City, where he has been negotiating for the equipment of a new mill it is proposed to instal this summer. The headquarters of the Clarence Cunningham mining interests are to be moved from Sandon to new quarters adjacent to the Alamo mill site.

Mining Convention at Nelson.

The Board of Trade of Nelson, B.C., is asking the Provincial Government to support the International Mining Convention to be held in that City on June 19-20-21, by a vote of $1,000. It is pointed out that the Government aided the Vancouver Convention to the extent of $2,500 and also assisted that of 1918 at the City of Revelstoke, B.C. The mining men of the interior of the Province are enthusiastically behind those who are arranging for this gathering, and it is proposed inviting representative mining men from the adjacent States as well as from all parts of British Columbia. There will be a full discussion of all the problems affecting the industry of the Northwest and it is hoped that action will be decided upon that will have beneficial results. Incidentally visitors will be assured of ample entertainment.

Will Develop Gypsum Deposits at Falkland, B.C.

The British Columbia Gypsum Co., Ltd., announces its intention to develop its large gypsum deposits at Falkland, Grande Prairie, near Kamloops, B.C. A modern plaster mill is to be erected on the property. The Manitoba Gypsum Co., which is successfully operating in the prairie province, owns the greater part of the stock of the British Columbia Company. The decision to open up the Falkland property is believed to have been a result of the promise that a Kamloops-Okanagan Railway will be constructed, thus providing necessary transportation facilities.

Algeria's production of minerals in metric tons for the first three-quarters of 1918 included iron, 674,106; lead, 11,429; zinc, 37,297; pyrites, 10,976, and antimoney, 6,400. The report comes from Consul A. C. Frost, sfationed in Algiers.

New Machinery for Placer Mining.

An organization known as the Noble-Metals, Ltd., Vancouver, B.C., announces its intention to undertake active placer mining this season in the Omineca and other British Columbia Districts. It is said that entirely new machines and methods of recovery of gold and other previous metals from the placers of the Province will be used. A five-ton per hour capacity machine is reported to weigh less than 150 lbs., making it possible to transport it easily on horseback to "the most inaccessible parts of the interior." It also is stated that this machine, when necessary, may be operated by hand power. The company announces its intention of developing placer and other deposits on a royalty, lease, or percentage of gross earnings basis.

Canada Copper Corporation.

The strike of workmen who were engaged in the construction of a branch railway from Princeton to Copper Mountain, B.C., the latter being the site of new mines of the Canada Copper Company, continues at the time of writing, May 6. There are no signs of a settlement, despite the attempts of government officials and others at conciliation, and consequently the preparations which had been going forward on a large scale to put the company's mining property on a shipping basis remain at a standstill. The position of the Canada Copper Corporation is shown by the terms of the following notice, which was posted recently by instruction of the management:

Notice.

Any employee of the Canada Copper Corporation, who has joined the union of the railway strikers is hereby requested to withdraw from said railroaders' union or leave the employ of the Canada Copper Corporation.

The reason for this request is not that the Canada Copper Corporation is opposed to organized Labor (provided said organiaztion does not seek to establish a closed camp) but is very much opposed to giving support to the railroad strikers.

We consider that a minimum wage of 40 cents per hour for unskilled railway labor is a fair wage to-day, and that since the railway company is making no demand for a 10-hour day, they are not acting either unreasonably or unfairly, but, on the contrary, are both reasonable and fair. The fact that the great majority of laborers on the railway are employed by station men, means that the great majority are receiving 45 cents per hour instead of 40 cents per hour. Before the war the minimum wage on railway construction was $2.50 per day of 10 hours. The 40 cents per hour now offered is 60 per cent higher than the wages paid before the war.

If employees of the Canada Copper Corporation wish to join a miners', millmen's, or a smelter-men's union, they are at liberty to do so, but to join the railroaders' union they are merely helping the railroaders to tie up our mine and mill, and that means we will have to close up our works both at Allenby and Copper Mountain.

We intend that Canada Copper Corporation money shall not help support a strike that will close us down.

The notice is signed by the Canada Copper Corporation, Limited, per H. R. Van Wagnen, and is dated at Allenby, April 22nd.

L. F. Fogle succeeds F. C. Moore.

F. Cushing Moore, who has been associated with Clarence Cunningham as consulting engineer at the Hewitt and Van Roi Mines, Silverton, B.C., has severed his connection with the Cunningham interests and has left for Spokane, Wn. L. F. Fogle, former mill superintendent for the Consolidated Interstate Callahan Company, in the Coeur d'Alenes, recently took charge of the Hewitt and Van Roi Mills.

Mr. F. M. Sylvester's Views on Joint Council.

The Royal Industrial Commission, appointed by the Dominion Government to investigate and report upon the relations between employee and employer throughout the Dominion, met in British Columbia recently to take evidence. Among others heard was F. M. Sylvester, managing director of the Granby Consolidated Mining & Smelting Company, who expressed the fear that any effort to establish a joint council of employees and employers for the purpose of handling labor problems would have to be confined to units if it was to meet with success. He said that such a joint council might fail because there "is so much difference of opinion and such a wide chasm between the employer and the employee in many industries. In his opinion an organization of the kind would have to be built from the bottom and extended over a long period to meet with success. Mr. Sylvester told the Commission that he had not give the question any great study, but he thought that the results achieved by an industrial council would be in proportion to the provision made for the education of the men. Progress could only be by evolution. Each industry would have to work out its own salvation. To illustrate his position he pointed to the impracticability of two cities having an amalgamated government. This would not work out, and for the same reasons different units of industry could not be regulated by an industrial council with satisfactory results.

Coal Mining Branch for Institute.

The complete re-organization of the British Columbia branch of the Canadian Mining Institute has been decided upon and H. Mortimer-Lamb, the secretary treasurer of the organization, is in the Province for the purpose of attending to the details. As a result, there has been a meeting of coal mine operators at which it was decided that it would be in the best interest of this branch of the mining industry that it should have an entity separate and distinct from the metalliferous interests. The majority felt that the Institute's activities in this Province heretofore have been devoted to such an extent to the metal mines that those associated with the coal industry have been overlooked, or, at least, given so little attention, comparatively, as to make it scarcely worth their while to continue with the organization. They, however, realized the benefit of the work of the Institute, generally, and wished to continue to support it, but not on the same basis of the past. If a coal mining section of the western branch of the Canadian Mining Institute were launched they would give it their hearty endorsation, as it then would be possible to give problems peculiar to the industry the attention warranted by their importance: It appears that the same sentiment exists among the coal miners, who are members of the Institute throughout Canada and, consequently, Messrs. Thomas Graham, superintendent of the Canadian Collieries (D), Ltd.; John Hunt, General Superintendent of the Canadian Western Fuel Company, and George Wilkinson, Chief Inspector of Mines of British Columbia, all of whom have long been prominently identified with the coal mining industry of the province, have subscribed themselves to the following circular.

"It is suggested that a special section of the Canadian Mining Institute be organized in the interests of the members engaged in coal mining in Canada. This Section should have branches in Nova Scotia, Alberta, and Eastern British Columbia and on the Pacific Coast. May we depend on you to assist in organiizng a Coast Branch of this section, and also to give it your active suport after organization. It is obvious that such a branch will serve a most useful purpose in bringing the coal men together in their common interests. It is hoped, therefore, that you will reply in the affirmation to the above inquiry. Please address your reply to James Hargreaves, Technical Branch, Parliament Bldgs., Victoria, B.C., who has kindly consented to act as Provisional Secretary of the proposed coal branch."

These have been forwarded to as many of those identified with the industry in the coast district as possible. It may be that some have been inadvertently overlooked and, if so, they are requested to accept this notice.

On June 4th it is proposed holding a gathering of coal mine operators and others interested at Nanaimo, B.C., at which the organization will be completed and questions relating to the industry discussed.

Miners' Evidence Before Commission.

At the sitting of the Royal Commission on Industrial Relations held in Victoria on Monday, Robert Walker, member of the Cumberland Miners' Committee, said the results of the arrangements whereunder the grievance committee of the employes in the Cumberland plant of the Canadian Collieries (Dunsmuir), Ltd., meet the management every month or oftener if necessary, were good. Relations between the men and company had materially improved since the new management took charge.

One source of discontent among the men was the opinion that they were being denied the righ to organize. They feel they are under the absolute control of the management, and if the present management were changed that they might suffer at the hands of the new. While he did not know much of the Whitley plan of joint management and control, he felt that if it meant merely increased efficiency, there would be little gained by its adoption. But if the conditions under which the workers worked and lived would be improved it would undoubtedly prove beneficial.

Asked what he considered were the chief causes of unrest among the labor unions, Mr. Walker somewhat surprised his hearers when he declared it to be his opinion that the main cause was the idea the workers have of the corruptness of the union officials. He also referred to the labor troubles at Princton and the opinion of some of the men that police are being sent in with some ulterior motives. In the Cumberland district the workers feel they should have a greater share of the product of their labor. If they felt they would get something more along that line they would be more satisfied, though he supposed they would not be really satisfied, until they got it all.

He stated that the Cumberland men voted for the One Big Union idea, 169 to 5, and on the proposal of the six-hour day and five days a week only 12 voted against. There was no complaint about wages there, the chief demand being a shorter day. There was discontent, too, because of the men having to work with Asiatics.

Mr. William Fraser, employed by the Canadian Collieries Company at Ladysmith, said the present arrangements for the men meeting the management worked out fairly well. There is a branch of the union there, but the company did not recognize it. Opinion was divided, he said, as to whether the present committee arrangement was better than a union. The chief cause of discontent among the workers was the high cost of living. The last increase made under the system of readjustment every three months had been exactly two and three-quarter cents per day, while in the shipyards the advance had been at that amount per hour. No dissatisfaction has been expressed in the Ladysmith district with the eight hour day from bank to bank. The six-hour day had not be discussed, he said. Up to recently there had been little or no unemployment, but now that men were returning from overseas there was some. The company was putting returned men to work as fast as it could. He suggested some public works at Ladysmith which the Government should undertake to provide employment, among them being new wharf, extension road work, etc., as well as the re-opening of the smelter, thereby encouraging mine development.

The Rotherd Furnace.

The Industrial Committee of the Victoria Reconstruction Group, a body of business men banded together to forward the development of the natural resources of British Columbia, is urging the Provincial Government to lend its financial support to the end that the Rotherd Electric Furnace is established in this Province. It also is recommended that the water power available at Stamp Falls, Vancouver Island, be reserved in order that they may be harnessed to supply the necesarry electrical energy. Opinion is not unanimously in favour of immediate action, the view having been expressed by some organizations that the efficiency of the furnace should be subjected to careful investigation before the Province should lend its guarantee to the bonds which would have to be floated in the financing of the enterprise. It should be observed that the Reconstruction Group does not go on record as being in favour of the guaranteeing of bonds. On the other hand its resolution, which now is before the Executive Council, concludes as follows: "It is therefore urged that the industries of the Province should be developed by Provincial finances for the benefit of the community at large rather than for that of certain individuals." The Government, however, at present has only one proposition before it from those who control the smelter, namely, that it should go behind the latter up to a certain point in any issues that may be necessary. Incidentally, it is interesting to note that and ex-parte report on the furnace is not yet evailable. and that the Industrial Committee—a body composed of representatives of the returned soldiers' organizations—ask that action be suspended pending the result of investigations being made as to the practicability of the soldiers undertaking the operation of the suggested smelter.

Miners Want Assay Coupons With License.

The Free Miners' League of Prince Rupert has presented a petition to the Provincial Government asking that the Minister of Mines appoint licensed assayers at central points throughout the Province. It also is asked that the holder of a Free Miners' License Certificate, when purchasing his license, shall receive five assay coupons, each of which, on presentation to a district assayer, shall entitle him to one assay at half the current charge. These coupons, it is suggested, should be made valid only for the year of their issuance.

Officers for Nelson Convention.

A meeting of the Nelson, Slocan, and Eastern British Columbia Mining Associations was held recently at Nelson at which preliminary arrangements were made for the International Convention to take place on June 1920 and 21 at Nelson. An organization was appointed to prepare for the gathering, the personnel of which is as follows: Hon. Wm. Sloan, Minister of Mines, honorary president; S. S. Fowler, Riondel, honorary vice-president; Sidney Norman, Spokane, Wn., honorary vice-president; Frank C. Bailey Spokane, honorary vice-president; A. B. Trite, Fernie, honorary vice-president; J. J. Malone, Nelson, president; W. A. Cameron, Rambler, vice-president; A. N. Wallinger, Cranbrook, vice-president; Fred J. Peters, Rossland, vice-president; Alex. McCrea, Revelstoke, vice-president; J. R. Hunter, Nelson, vice-president; J. D. Blackwood, Nelson, vice-president; J. E. Thompson, M.P.P., vice-president; Fred R. Starkey, Nelson, secretary; J. A. Gilker, Nelson, treasurer; A. G. Larsen, Spokane; M. M. McCune, Sheep Creek; E. W. Widdowson, Nelson; I. G. Nelson, Nelson, and C. F. Caldwell, Kaslo, directors.

Rich Silver-Lead Ore at Woolsey Mine.

What is described as an exceptionally fine strike is reported from the Woolsey Mine at Silver Creek, near Albert Canyon and east of Revelstoke. Cross-cutting and other development has opened up a vein said to carry about fifteen feet of milling ore and twenty inches of very high grade silver lead ore.

STEEL PLATE CONSTRUCTION

Oil Storage, Gasoline Tanks, Air Receivers, Pneumatic Water Supply Tanks, Smoke Stacks, Boiler Breeching, Riveted Steel Pipe, Bins and Hoppers.

UNREST.

A protracted period of high cost of living has had its natural consequence—widespread unrest. Now comes a demand for shorter hours of labor, which would naturally lead to higher cost of production of essentials and consequently further increase the high cost of living. The unrest is not surprising, for the purchasing power of money has greatly depreciated. The long and costly war has imposed a great burden on people in all parts of the world. The endeavor of various classes to shift the burden onto others naturally bring discontent.

The labor unions are at present engaged in an endeavor to improve the condition of their members, and it is quite proper that they should do so. Other citizens will sympathize with members of the unions, but they also are affected by the high cost of living and they will not take kindly to a movement that will give costs another boost. The labor unions would be more popular with the rest of the community if they would endeavor to bring down the cost of living while maintaining wages at the present standard.

In the mining industry the eight hour day is already in force in Ontario for underground workers. It is generally necessary to have some of the surface men work a little longer. We need not expect any radical change in hours at Ontario mines so long as miners are willing to do a reasonable day's work. A miner can, if he wishes, do a good day's work in eight hours. A very much shorter day would, however, make mining a farce, and make inadvisable the furnishing of capital for developing and equipping mines.

In the search for properties and in their development much money is expended without any return. The workmen get their wages, but the men who supply the money are more likely to lose than gain. They run the risk in the hope of finding a prize; but the prizes are few. If there are no prizes there will be no one to risk the larger expenditures and there will be no new mines developed. The capitalist must depend on the miner to do his part and he must see that the miner gets a reasonable wage. The miner also must keep in mind the fact that those who supply money to develop mines are making profitable work for the miner. There must be co-operation or there will be no mining.

Mining is a hazardous occupation and the men who engage in it should receive higher wages than men of corresponding ability in many other occupations. Unless mining can be so conducted that all who engage in it can earn a decent living and enjoy a reasonable share of the good things of life we might better have no mining industry. If by unrest in other industries the cost of living is increased, is it reasonable for the miner to keep alive that unrest by supporting it in any way? In his own interest he should try to keep down the cost of living. It is reasonable for miners to unite their forces to obtain better conditions in their own industry, but it seems to us that in the present situation their natural allies are their own employers. They must, of course, make satisfactory term with their employers; but they might well recognize that they have in high costs a common enemy.

There has been much in evidence lately the term "collective bargaining." What this may mean needs definition in every case. In some cases, for instance, all the employees of a company might collectively bargain with their employers, or all the miners in one district might collectively bargain with the employers in that district. These are simple cases such as are of frequent occurrence. When, however, miners in widely separated districts unite and wish to deal with their employers through officials of such unions rather than through local unions, we generally find trouble. This trouble arises not so much from the method of procedure as from the history of the international unions. This has been the stumbling block in many cases. Now that several more years have passed, years of much greater consequence tha nany preceding ones, without the chief international union giving many indications of behaving as in the past, we might perhaps do well to forget its history and live more in the present.

Collective bargaining may also be interpreted to mean bargaining with employees or representatives of employees in some other industry. This seems to us, as indicated above, an unwise proceeding. The present conditions in some industrial centres seem likely to give their method of bargaining an unsavory reputation..

There is unrest in the mining districts as elsewhere. The gold and silver mines of Northern Ontario are in splendid shape to make a good showing this year. As compared with some mining districts the demand for labor at Cobalt, Porcupine and Kirkland Lake will be exceptionally good. It is reasonable to expect that the miners in these districts appreciate their good fortune. It is not possible, however, that they will escape the unrest bug altogether.

POWER FREIGHTER CARRYING ORES AND MINING SUPPLIES.

At the time of taking over the Dolly Varden Mines the Taylor Engineering Company is running the trials of its new large power freighter, the Teco, which will carry supplies and general cargo to all way ports en route to Alice Arm and to the Dolly Varden properties, and bring back cargoes of concentrates from the mine property. The Teco is intended to be the first of a fleet of power freighters for the British Columbia coast trade; the fleet to be controlled by the Taylor Engineering Corporation.

Additional interest is created owing to the fact that the crew of the new craft will consist entirely of men from the motor boat patrol service. She will be under the command of Lieut. E. C. Godfrey, who is the son of Mr. Godfrey, of the Bank of B. N. A., Vancouver, B.C., and who has recently returned from long service overseas.

The Teco was designed and built by the Taylor En-

gineering Company and has a 300 ton deadweight cargo capacity. She is so constructed that she can be turned into an oil tanker at seventy-two hours notice. She is 125 feet long with a 23-foot 6-inch beam and is driven by 200 h.p. Bolinder type engines. Her fuel capacity will give her a 1,600-mile cruising radius and she is designed to develop a speed of 8½ knots when fully loaded. She has accommodation for a crew of twelve men.

The Teco is to be docked after her trials and after the installation of a special quick-handling deck winch of a new type in about three week's time she is expected to take up her regular run.

FEDERAL EMBARGO ON GOLD EXPORTS.

The following letter addressed by the Mining Bureau of the Board of Trade of Vancouver to the Minister of Finance, Sir Thomas White, is of general interest to our readers, and points out clearly a weakness in the Federal measure which is intended to prohibit the free export of gold out of Canada:

"The Mining Committee of the Board of Trade of Vancouver note with pleasure that, with a view to conserving the financial strength of the Dominion the export of gold from Canada will be prohibited except with the consent of the Government. Permit us to point out to you that your regulation, however, only applies to gold in the bullion form. As a matter of fact five-sixths of the gold produced in British Columbia is derived from complex sulphide and copper ores, and while the ores mined by the Consolidated Mining & Smelting Company are now refined in this country and their gold product available to strengthen your gold reserve, the remainder is shipped out of Canada to American smelters and refineries, and you lose the benefit of that gold for your national purpose unless you provide that, for such gold exported in concentrates or blister copper, an equivalent shall be returned to the Treasury at Ottawa by the American smelters and refineries receiving the products from this side.

For instance the Belmont Surf Inlet Mining Company shipped to Tacoma Smelter in the State of Washington last year about $1,000,000 of gold contained in concentrates. The Tacoma Smelter has a refinery in connection with its smelter so that no hardship is inflicted on anyone by requiring the Belmont Surf Inlet Mining Company to arrange with the Tacoma Smelter for the return to the Dominion assay office at Vancouver of the gold bullion obtained from its concentrates.

While you cannot, of course, control American Smelters and refineries, you can provide that the Canadian Companies shipping gold under such conditions shall arrange to have that gold or its equivalent returned to Canada.

We submit that, unless you make provision, your purpose will be largely defeated, desirable as your policy is to conserve international credit; and venture to make the suggestions conveyed in this letter to make your plan as effective as possible.

We hope such a policy will lead to the refining in Canada of all metallic products of this country, to the national enrichment; the employment therein of our own people and natural resources such as the water power; and any co-operation this Bureau can offer you in such a policy will be cheerfully given.

Yours truly,

Secretary, Mining Bureau."

BRITISH TRADE FAIRS.

At the request of the Senior Trade Commissioner for the Imperial Department of Overseas Trade we have pleasure in giving publicity to the following circular announcing Trade Fairs in London, Birmingham and Glasgow, which would appear to offer good opportunities to Canadian manufacturers to advertise their wares in the United Kingdom.

The Senior British Trade Commissioner in Canada and Newfoundland, (Mr. G. T. Milne) is informed by the Imperial Department of Overseas Trade that Fairs representative of various branches of British industry will be held concurrently in London, Birmingham and Glasgow early next year. The London Fair will be organized by the Imperial Board of Trade, and the Fairs at Birmingham and Glasgow by the Municipal Corporations and Chambers of Commerce of these cities, but under the auspices of the Board of Trade.

These Fairs which have been held annually since 1915 were somewhat limited in scope during the war period owing to the restrictions which had to be imposed in the interests of munition manufacture. The future Fairs will; however, be on a scale commensurate with the magnitude of British industry.

For the purposes of the London Fair the Crystal Palace, which is the largest Exhibition Building in the world, has been secured. On the ground floor alone there are 14 acres of floor space. This Fair will embrace a wide variety of products, including cutlery, silver and electro-plate, jewellery, paper and stationery, fancy goods, brushware, drugs and druggists' sundries, musical instruments, scientific instruments, toys and sport goods.

The Birmingham Fair will include general and domestic hardware, tools and small machine tools, lighting fittings for electricity, gas, oil, etc.; India rubber goods, machinery belting of all kinds, motor cycles and cycles; accessories for motor cars, cycles and aeroplanes; sanitary appliances and a number of other items utilized in industrial and domestic construction.

The Glasgow Fair will embrace textiles of all descriptions, both in the piece and made up, boots, shoes and gloves, foodstuffs and beverages, and light and heavy chemicals.

The British Industries Fairs are not exhibitions—they are Trade Fairs to which admittance is restricted to "bona fide" trade buyers seriously interested, and admission is by invitation only.

Participation in the Fairs is confined to British manufacturing firms, which shall be deemed in this instance to be firms whose principal works and Head Offices are situated within the British Empire, and which are not controlled by Foreign interests. Exhibitors are not permitted to exhibit goods other than those they actually manufacture. From the foregoing it will be noted that Canadian manufacturers are eligible as exhibitors.

Full particulars may be obtained at the office of the Senior Trade Commissioner, 367 Beaver Hall Square. Montreal, and applications by Canadian manufacturers for space will be received by the Senior Commissioner up till 31st August next.

Education has been mentioned as a cause for discontent. This is to be regarded as a sign of progress. Insofar as discontent is the result of intelligent observation it is a virtue. We hope that there will always be much discontent of this kind in Canada.

Occurence of Elaterite, or Elastic Bitumen, in a Fluorite Vein at Madoc, Ontario*

By CYRIL W. KNIGHT.

The attention of the Ontario Bureau of Mines having been called to the occurrence of a peculiar bituminous substance in the fluorite vein of the Canadian Industrial Minerals, Limited, at Madoc, Hastings County, Ontario, the writer spent a short time in the early part of May, 1919, examining the deposit. Mr. R. C. Bryden, manager of the company, very kindly took the writer through the mine, and pointed out the location of the material. Specimens were collected and forwarded to Ledoux and Company of New York, and the material was determined to be "elastic bitumen," or "elaterite." Elaterite has not previously been found in the Province of Ontario, and its occurrence is not mentioned in Johnston's "List of Canadian Mineral Occurrences" published by the Geological Survey of Canada.

The fluorite veins at Madoc have been known for many years. They contain, in addition to fluorite, the minerals barite and calcite. It was only during the Great War that they were worked to any large extent. Mr. T. F. Sutherland describes sixteen properties around Madoc in which fluorite is found.† The deposits are also described in this Journal for June 15th, 1918, and in the Twenty-Second Report of the Ontario Bureau of Mines, Part II.

The veins intersect granites, schists, crystalline limestones and other rocks of pre-Cambrian age, and also fossiliferous limestones of Black River (Paleozoic) age. The deposit owned by the Canadian Industrial Minerals, Limited, occurs in a red and grey granite and has been worked to a depth of 200 feet. The elaterite was found on the 200-foot level, and was seen at the time of examination to occur sparingly — less than half a pound altogether—for several feet along the vein where the latter is two or three feet wide. It is not found in economic quantities. It has a dark brown color and occurs in vuggs in the vein material. In the specimens collected these vuggs are from a fraction of an inch to one or two inches in length and fractions of an inch in width. It was reported by Mr. Bryden that larger masses of the material had been found.

The description of the identification of elaterite by Ledoux and Company is given below:

"After superficial examination of the sample of bituminous substance associated with fluorite, barite, calcite minerals referred to in your favor of May 10th, 1919, especially with regard to the manner in which it melts and burns and the action of organic solvents upon it, we have little hesitation in expressing the opinion that it is elaterite, known also as mineral caoutchouc or elastic bitumen.

"Elaterite and similar bitumens are subject to change in composition due, in part, to more or less oxidation. There are a number of closely related compounds which have been given different names by different observers. The original mineral appears to be an unoxygenated hydrocarbon containing 86 per cent. of carbon and 13 to 14 hydrogen.

"The only way to positively identify the compound would be by ultimate analysis, but the sample submitted is insufficient for this purpose; at least, it is impossible to separate enough of the hydrocarbon perfectly free from the associated inorganic minerals to obtain an accurate analysis. We do not believe it is necessary to go to the considerable expense of ultimate analysis for the purpose of classification, since, if the mineral is not elaterite, it is at least something very close to it, and, furthermore, such authorities as there are on these minerals differ as to the composition.

"We would also call your attention to the fact that the bitumen in the sample is not uniform, part of it being more or less sticky and fluid, while the rest is of the consistency of crude rubber. This variation in consistency (and also in composition) is noted in Dana's Mineralogy."

It may be added that Mr. R. C. Bryder told the writer that he considered the material to be elaterite. This was before the sample was forwarded by the Ontario Bureau of Mines to Ledoux and Company for definite identification.

The origin of the elaterite in the fluorite vein is obscure. It may have been deposited at the same time as the fluorite, calcite and barite which now compose the deposit. If this is true, then possibly the elaterite may have had a volcanic origin, since fluorite is often considered to have been deposited from gases and vapours given off by igneous rocks. There are, however, no known igneous rocks cutting the Paleozoic beds between Madoc and Lake Ontario.

Another suggestion as to the origin of the elaterite is that the material descended into the vein from pools of oil which might have been present at some time prior to erosion in the overlying beds of Paleozoic limestones.

Whatever may be the origin of the material it is interesting to speculate as to the possible occurrence of a large vein of the material in the Madoc area, hidden somewhere in a valley or other depression. Southeastern Ontario has produced an amazing variety of minerals, some of them in paying quantities, such as talc, fluorspar, feldspar, graphite, mica, iron pyrites and other minerals. Perhaps the region has in store another surprise in the form of workable deposits of elaterite, or some other closely related hydrocarbon.

It is worth while recalling in this connection the deposit of the hydrocarbon known as albertite, which was found in New Brunswick many years ago. The occurrence is described by Frederick G. Clapp in a publication (No. 291, Vol. 2, page 59) o fthe Department of Mines, Ottawa, as follows:

"In 1849 Dr. A. Gesner discovered on Frederick brook near the present site of the Albert mines, a vein or bed of a bright, jet-black, shiny mineral, after-

*Published by permission of Thos. W. Gibson, Deputy Minister of Mines for Ontario.

†Ont. Bur. Mines, Vol. 27, 1918, pp. 136-138.

wards identified as mineral pitch or bitumen, and called albertite. This mineral proved on investigation to be of great value and was mined for nearly thirty years at great profit. The records of production were destroyed, but it was known that in each of the years 1865 and 1866 the output of albertite was 20,500 tons, while the total from 1863 to 1874 amounted to 154,800 tons, and during the entire period of working it was probably not far from 230,000 tons. The price ranged from $15 to $20 per ton.

"Albertite is a solid bitumen representing the residuum of petroliferous seepages. It occurs in veins in the Albert shales at several points in Albert and Westmorland counties. While in itself an indication of petroleum in past times rather than at present, it is generally associated with petroliferous shales, and in the Albert mine liquid petroleum was actually collected in buckets from seepages from sandy beds included in the shales associated with the albertite. Albertite is not a coal, notwithstanding the opinions of certain interested parties or legal decisions, but is a petroliferous residuum and therefore to be classed among the indications of oil, at least to the extent indicated above."

BRIDGE RIVER LILLOOET DISTRICT.

A party of geologists, from the Federal Government, in charge of Capt. W. S. McCann, who has seen service at the front, is making a survey of the geological formation along the Bridge River between Rexmount and Gull Lake in the Lillooet District.

This is the completion of the work, left unfinished by Mr. C. W. Drysdale, who was drowned in 1917. At the time of the drowning Mr. Drysdale's entire manuscript was lost. This necessitated the work being done all over. It is expected this will be finished this year.

THE SHORTER DAY.

Trouble has developed through the enforcement of the Provincial Eight Hour Act, which gives the eight hour working day to all workers in and around a coal mine. The underground workers had the Eight Hour Day. This legislation extends it to those employed on the surface. In the application of the measure, however, W. H. Armstrong, director of Coal Operations in District 18 (Eastern B. C. and the Province of Alberta), has issued an order permitting a reduction in wages proportionate to the time employed. Thus, in Eastern British Columbia, which embraces the Crow's Nest Pass Collieries, the men, while getting a shorter day by an hour, may expect a reduction in their pay. As a result orders recently came to the unions of Fernie and Michel from the Calgary, Alberta, headquarters of the U. M. W. of A. to take a ballot of the men to ascertain their feeling as to the declaration of a strike for the purpose of registering their resentment of the Armstrong dictum and, of course, to force the company to pay the same scale for nine as for eight hours. This was done and shows that the majority are in favor of the extreme step should it become necessary.

Further advices received to-day from Fernie make slight change necessary in my notes re enforcement of Eight Hour Day Law and its result, namely, the taking of a strike vote in District 18, the outcome being that the majority appear to be in favor of that course of action. It seems that the surface workmen in and about the Crowsnest Pass Coal Mines have been, generally, conceded nine hours pay for eight hours work, that is their wages will not be affected by the change in hours called for by statute. Some, however, notably the fanmen at Coal Creek, have been working ten and eleven hours a day. In cutting their working day to eight hours it is proposed that their pay shall be based on the nine hour rate, in other words, if they worked ten hours, one hour's pay will be taken from their wages. It is on behalf of men so placed that the strike is proposed and not, as suggested in my memorandum of yesterday, for the maintenance of the claim of all surface workers for nine hours pay for eight hours work. No definite action has yet been ordered from the U. M. W. of A. headquarters at Calgary and in the meantime W. H. Armstrong, the director of coal operations, is at Fernie conferring with the men and the operators with a view to the reaching of an understanding that will avoid the tying up of the coal mining industry of eastern British Columbia and Alberta.

WASAPIKA.

There is considerable interest now in the West Shining Tree gold area. It seems likely that the area will at last receive the attention it deserves. The good judgment and persistence of Mr. George Rogers, who has been responsible for most of the development work done in recent years, seems very likely to result in the adding of at least one mine to Ontario's gold producers. Mr. Rogers has been quietly plodding along and we are glad to learn that he is meeting with considerable success. If the Wasapika proves to be as good as it looks it will be a real mine.

Some good should come out of all the discussions that are now going on in the industrial world. It is reasonable to hope for a better understanding between employer and employee in the future. There is naturally a feeling of pessimism over the present situation; but after both sides have been presented and the differences adjusted Canada will undoubtedly begin a new era of industrial prosperity.

It has been brought forward as a cause for discontent that certain companies have published reports showing that they made very large profits. It is well to bear in mind, however, that it is customary to give much more publicity to successful ventures than to unsuccessful ones. Comparatively few men care to advertise their losses.

Molly Gibson.

The Molly Gibson, one of the properties of the Canadian Consolidated Mining & Smelting Company, situated near Kitto Landing on Kootenay Lake, which has been idle for some months, is once more shipping ore. The tram line, which was damaged by snowslides, has been repaired.

Pumping Out Suquash Mine.

The pumping of the water from the workings of the Suquash Mine of the Pacific Coast Collieries, which is situated some distance north of Nanaimo, B.C., on the east coast of Vancouver Island, is being undertaken. This mine was closed when the war broke out in 1914 and since has been practically deserted. It is understood to be the company's intention to put the mine on a producing basis at the earliest possible moment. The Suquash coal is of good quality and with adequate transportation facilities should be assured a ready market.

-:- Peace River Oil -:-

By J. J. RUTLEDGE.

This is the fourth successive year of drilling for crude oil in Peace River, Alberta, and the deepest depth attained to date is 1,155 feet. During the four years referred to six wells have been put down with not a dry hole in the lot. In more than one well the oil rose of its own pressure to a height of 425 feet in the well. One well is estimated by the driller at over 100 bbls. daily capacity.

These six wells cover a distance of about fifteen miles in a straight line from north to south and along the banks of the Peace River.

In the spring of 1916 the first well was drilled to a depth of 1,135 feet. At 930 ft. the oil producing sands were encountered, showing 70 feet of productive oil sands. At the depth of 1,100 feet salt water was struck which stopped further drilling on that well beyond the 1,135 ft. level.

The spring of the following year (being 1917) the second well was drilled, and on the 11th day of October the oil sands were reached at the 962 ft. level (this well being at a point one and a half miles south of well No. 1.)

When the drill had entered the oil sands to a depth of 17 feet in the sands, the oil rose on the first day to a height of 40 feet in well. The second day oil rose to a height of 90 feet in the well, and the driller gave it as his opinion, considering the rapidity with which the oil entered the well, that the well would bale 50 bbls. or pump 100 bbls. each 24 hours. Drilling was continued on down in the oil producing sands of this same well, No. 2, till the depth of 1,032 feet was reached, thereby making in all 70 feet of continuous oil producing sands. The oil here rose to a height of 425 feet in the well. With the above estimate of the driller to go from as a guide one may estimate the probable production with the oil at the 425 ft. level in the well. The 100 bbl. estimate taken from driller's statement of oil at time of being 90 feet in well on 13th day of October, 1917.

Not satisfied with this remarkable showing of oil at so shallow a depth, the company, or some other person or persons, in authority, decided to go on further down with the drill in order to reach what is persistently believed will be found the Great Sea of Oil below, and at the 1,085 ft. level entered salt water which continued on down to the 1,125 ft. level. Here the casing was set in eight feet of solid standstone and water was shut off successfully. It being now well on into cold weather, December, work was stopped for the short winter spell. During this interim the salt water broke the casing at the collar and let water into the well. The weather being cold it was impossible to shut it off. The next best thing to do was to move location again during winter, and the outfit was moved to a point six miles further south and still on the bank of the Peace River. Work was started during the summer of 1918 on well Number 3, with the result that at about same depth, 962 ft., the oil has been encountered, and it is hoped that better luck will follow this well than that which overtook the first two wells.

Across the river a well was put down last year. On approach of winter the oil was struck at 962 ft. and with the drill into oil sands for 30 feet the oil rose about 200 ft. when work was discontinued for winter. It is hoped that when the bottom of the oil sands is reached that a pump will be placed on the well and actual production capacity ascertained.

One mile south of this last mentioned well another plant has been installed. The drills are down some 200 ft. This summer good results are looked for here.

Two miles further south and on the same side of river bank a rig was working. At closing time for winter season last fall approximately 900 feet had been drilled.

On the opposite bank and on the east side of the river is another well down 1,155 feet and into oil. The operators have not yet commenced work this spring. Six miles south of well No. 3 mentioned above, and at the townsite of Peace River, is the well of the Consolidated Oil Company, a corporation capitalized for $2,500,000. This well is now down to the 1,139 foot level, with the drill into two feet of oil producing sands. From reports, which can be verified, it would appear as though this prospect promises to be as good as the best well above described.

On the opposite bank of the Peace River from the townsite, another company with an up to date rig of the Standard pattern is operating. This company is now hard at work drilling and the well is down about 300 feet. From indications of the formation passed through, and comparison with all the other wells, the wise men in the geological line assert that there can be no doubt but that good results will follow from this drilling also. So we have in all six wells to date that have pierced the genuine oil producing formation. It only requires now that pumps be placed on the property to determine the actual producing capacity.

It may be well to here call the attention of the reader to the fact that we have now a prospected field of some twenty miles in extent, with more than promising results and yet there is not the slightest evidence of what may be termed "An oil boom." What we have been anxious for is however happening in this field; an increase in drilling activity which will demonstrate to the world the existence of an old field here in Peace River. We do not desire a premature oil rush such as has taken place in very many portions of the globe. When we ship out by rail one car or a train load of the precious fluid, or "Liquid Gold" those living at a distance will soon learn of the Peace River Oil Field in Alberta.

Another item of great importance regarding this oil is the fact that by the cracking process it contains fifteen per cent. gasoline; fifty per cent kerosene; thirty per cent. lubricating oil, and one five per cent. residium, in the form of asphalt, this oil being of an asphaltic base. This we consider quite good enough. The oil is Sixteen Baume.

For the benefit of those interested in the production of oil in any country where transportation is as

good as it is here, this field being on a branch line of the standard gauge which connects with all transcontinental lines at Edmonton only 300 miles distant, it might be well to say: For the amount of territory covered to date and the shallow depth, approximately one thousand feet, and with a showing of over four hundred feet of oil in well from a uniform depth of seventy feet of oil producing sands, we are inclined to doubt if this condition for the amount of prospecting can be duplicated on this continent, and the end is not yet.

Another attractive feature exists here in this Great Dominion of Canada, and it is also mighty important to the investor, and it is this: The Dominion Government has a system of leasing in vogue which entitles the lessee of oil and gas leases from the Government to a lease of twenty-one years—with right of renewal of twenty-one years more, at the rate of fifty cents per acre per annum (with the proviso that a drilling plant be installed and in operation within the first eighteen months of the lease) it being the evident intention of the Government to encourage oil production, and more than that, the Government gives a bonus of fifty cents per bbl. on each and every barrel of oil so produced in the Dominion.

These conditions are generous. It is not going too far to say that an equal amount of liberality does not exist on the face of this globe in respect of the laws governing the securing of oil and gas leases from the Government of any country.

There is to date some three hundred thousand acres thus leased by our local people here, and it is not a difficult matter for any one who would desire to drill for oil to obtain a choice location under existing lease in good standing from the Government, upon very liberal terms as to a division of the oil without the payment of any cash down.

Of course, as soon as any one of these wells is placed on the pump and a certified statement of the actual production takes place, it is not out of reason to suppose that these leases referred to will be very much more in demand and as a result much more valuable than they would appear to the outsider to be to-day.

In conclusion, I wish to state that what is herein contained with regard to development and the field in general, can be taken as the actual fact, as I have been an actual resident on the ground from the first day of drilling here. I have the refined product, and a signed verification of the above facts by the drillers on the ground, together with the log and core of drillings. Experienced drillers make the statement that it is ideal drilling for a rotary, in which case a well should be put down in thirty days from commencement of drilling operations.

COAL LANDS CASE GOES TO PRIVY COUNCIL.

Two important actions, both involving title to the disputed coal rights of the Esquimault and Nanaimo Railway Belt, Vancouver Island, B.C., will come before the Privy Council in England this summer. Hon. J. W. deB. Farris, Attorney General of the Province, leaves shortly to appear before that court on behalf of the Province. One of these cases is that between the E. & N. Ry. Co. and H. W. Treat, the latter being a resident of Seattle, Wn. A lease was given the latter by the Provincial Government to certain foreshore on the east coast of Vancouver Island and to this the company, by virtue of the terms of the grant it received in the year 1884, claims the ownership. It may be stated that Mr. Treat proposes, if he is successful in his suit, developing the foreshore in question for its coal. From the Provincial standpoint its interest is to maintain the validity of its lease and to establish its authority to give such title. If the effect fails it follows that the company will have possession of all the foreshore on the east coast of the Island from Esquimault to Nanaimo, a distance practically as the crow flies of 80 miles and of indeterminate extent if the indulations of the shore line be followed. Then there are two cases of a similar character, namely, Esquimault and Nanaimo Ry. Co. vs. Dunlap and Esquimault and Nanaimo Ry. Co. vs. Wilson and McKenzie (Ganner Estate). In these Crown Grants to coal rights within the Railway Belt were issued to the defendants by the Provincial Government in accordance with the terms of the Settlers Rights Act, 1917. These Grants were issued by the Province during the interval elapsing between the passage of the Act by the Provincial Legislature and its disallowance almost a year later by the Dominion. The position taken by the company is that the Grants were vetoed automatically with the disallowance. If this is not controverted it is likely to have a serious effect on one large and important island enterprise of recent date, namely, that of the Granby Consolidated Mining & Smelting Company at Cassidy's Landing, to which some reference has been made in these columns. The Granby company holds its coal lands and, if the provincial title which it holds is found invalid, it may be in a serious predicament, as development has proceeded to the point that there is now a producing mine provided with modern plant and equipment. Besides coke ovens, which are understood to depend for their supply on the Cassidy Colliery, are nearly completed at Anyox, B.C., the site of the company's copper smeltery. For these reasons Mr. Farris's trip has a special interest to the coal mine operators of this Province.

Meanwhile the agitation among the settlers of the E. & N. Railway Belt, as a result of the disallowance of the Settlers' Rights Act passed at the last session of the Provincial Legislature by the Dominion Government, continues. A deputation of residents of the Newcastle District recently waited on Hon. John Oliver, Premier, and Hon. Wm. Sloan, Minister of Mines, to ask what action would be taken to secure them their coal rights in view of the course taken by the Dominion. It will be recalled that the Provincial legislation of 1917 was disallowed at Ottawa and that the Lieut.-Governor refused his assent to the re-enacted measure of 1918, this being done, it is assumed, on advice from the Capital. The delegation was informed that, in view of the attitude of the Federal authorities in 1917, and what has since transpired, there seemed little reason to believe that the 1918 legislation would be allowed, so that the chances of their having an opportunity to obtain title to their coal rights appeared to be slim. There are 180 settlers affected, at any rate that number of applications were under consideration at the time the Act was vetoed. These people propose now directing their representations to Ottawa and with that end in view a general meeting of protest is to be held at Nanaimo, B.C., shortly and it is considered likely that a delegation will be despatched to the Capital to present the settlers case, first hand, to members of the government.

HON. MR. SLOAN'S VISIT TO OTTAWA.
$100,000 For Ore Testing Plant.

That the Dominion Government is providing $100,000 for the establishment of an ore testing plant in British Columbia and that legislation is promised by the Federal authorities confirming the Provincial Government's action in throwing open Indian reservations for mining are two important announcements made by Hon. Wm. Sloan on his return to Victoria from the Canadian Capital recently.

In discussing with Hon. Martin Burrell, Minister of Mines for Canada, the matter of ore testing, Mr. Sloan pointed out the advantage of having the same established in connection with the University of British Columbia at Vancouver, B.C., and also suggested that an expenditure of $100,000 was scarcely adequate, it being probable that twice that amount would be necessary in order that the best results might be assured. Mr. Burrell, in reply, explained that a further grant could be made later if such was found to be the case and that in the meantime the $100,000 would permit a start to be made. As to the site of the proposed mill that was a question which had not been decided and the Dominion Minister could not concur in the view that it should be made an adjunct of the Provincial University. Mr. Burrell did not deny that it would be, if so placed, of great value in the technical training of western students while, at the same time, serving its purpose to the mining operators and the mining industry generally. But he took the position that if a precedent of the kind were established the central government would be called on to provide similar equipment in connection with all Canadian seats of learning. Mr. Sloan is extremely gratified that the Dominion Government has decided upon the construction of the plant although disappointed on the minor issue of its being made a part of the University. He thinks that it will prove a practical benefit of the utmost importance to those engaged in the development of the complex ores of some sections of the province, affording them a means of obtaining advice, without the expense and inconvenience of shipping ore to Ottawa for test, as to the most economical equipment to install for the treatment of the ores with which they are engaged.

Will Open Indian Reserves to Prospector.

As to the matter of Indian Reserves, of which there are large areas in British Columbia, Mr. Sloan informed the Dominion authorities that the province by legislation had thrown these lands open to the prospector, both under the terms of the Mineral and the Placer Acts, but that these amending Acts were inoperative until proclaimed law by the Lieut.-Governor. The latters' proclamation would be published when the Dominion Parliament passed confirmatory legislation, it being recognized that the Canadian Government was the final authority by virtue of being the guardian of the Indians. Mr. Burrell appeared to see no reason why reservations should not be opened and the Indian Department saw the matter in the same light. It, therefore, is promised that the necessary Dominion Legislation will be introduced at the session now in progress, whereupon Mr. Sloan asserts no time will be lost in recommending that these lands, which in many instances are highly mineralized and offer promising fields to prospectors, be declared free to the miner.

In the same category, almost, is the Dominion Railway Belt, a tract of land extending twenty miles on both sides of the C. P. R. in this province, and within the limits of which the control of minerals is divided between the Province and the Dominion. The precious metals are vested in the Province and the base in the Dominion. Mr. Sloan represented to the Federal authorities that the administration of these minerals should be in the Province, that until this was done their development would be retarded, and that the present unsatisfactory condition was stultifying the advancement of the mining industry. The Dominion Government, however, did not commit itself, taking the view that immediate action was not imperative and that this had best be left in abeyance until it was decided what course would be pursued in respect of the demand of the Prairie Provinces that large sections of their lands, now in the hands of the central government, be returned.

Another matter taken up at Ottawa by the Provincial Minister was the report that it was intended to remove the duty on fuel oil, to which proposal the coal operators of British Columbia have entered vigorous protest. They contend that the local market would be affected and that, as it is, the mines are not working to capacity. Mr. Sloan states that the viewpoint of the western producers was appreciated and that, in his opinion, the existing duty was not likely to be radically changed, if any amendment were made. The Dominion Government now controlled a large railway mileage in this Province and no doubt would use British Columbia coal, if for no other reason than to patronize home industry. The demand for the removal or reduction of the duty comes from the Prairie Provinces.

In regard to oil flotation Mr. Sloan was much interested in a demonstration of what is termed the alkaline process which he witnessed at Brooklyn. He says that, as far as he could judge, good results seemed to be obtained. While the oil flotation method in the treatment of British Columbia low grade ores had been a success the necessity of importing the oil needed made it somewhat expensive, and there now was an agitation among the companies using it for the reduction of the duty on this oil. If the alkaline process, therefore, proved in practical use to give the results claimed for it the industry might reap a very material benefit. On the probability of otherwise of such a development, however, he was not prepared to commit himself until more was known of the economical possibilities of the new process.

THE GOLD MINES.

In the gold camps of the north, particularly Porcupine, Kirkland Lake, and Boston Creek, the situation is gradually adjusting itself in favor of the gold mines, and all signs point toward the probability of the next few months and years being the most active and profitable ever experienced in the gold mining industry of Canada. In a number of instances the larger mines are adding to the scope of operations, while in numerous instances small mines are opening. In the case of the Hollinger Consolidated, work has assumed great magnitude.

Coke Ovens at Cole Creek Closed Down.

The coke ovens of the Crownsnest Pass Coal Company at Coal Creek have been closed down. Those at Michel, B.C., an adjoining colliery town, are expected to be able to produce sufficient to meet the present requirements.

WORK FOR THE CANADIAN MINING INSTITUTE.

Under the heading "The Canadian Mining Institute as a 'Prospect' for Canada and Canadians," the following statement of the opportunity lying before the institute, has been made by Mr. J. P. Macgregor of Toronto.

The success of the several Victory Loan campaigns has two definite lessons for members of the Canadian Mining institute: 1. Public support is the most powerful instrument in a free democracy; 2. Even the most astute of financiers had not hitherto guaged the miracles that could be worked by whole-hearted public support of patriotic purposes.

The mining industry has not had its just or fair measure of public support; largely, it may be said, because many, if not most, of the capable men associated with it have not grasped the completeness of the prevailing ignorance of the extent and value of the industry. Probably not one average citizen in ten naturally classes the mining industry as on a par with agriculture or general manufacturing.

Of necessity the development of the mining industry is, and has been, a matter of growth. The original settler of this country found the soil fertile; and so agriculture developed, and, as tools, utensils, supplies, clothing, etc., were needed, manufacturing followed.

But with the civilization of United States to the south at least half a century in advance of us industrially and with these infant industries—agriculture and manufacturing—to fall back upon, the development of the mining industry in Canada was artificially retarded by the comparative elimination of the spur of necessity; also the prominence of the precious metals in the early stages of the mining industry of this country, and together with the inevitable speculative excitement served to fix the mining industry in the public mind as a series of alluring speculations rather than as a stabilized and permanent industry. Hence, it is especially necessary at this time, when the reconstruction of the industries of the country on a solid and substantial and permanent basis is being surveyed, that the Canadian mining institute should be organized:

(a) To press for and obtain assisting legislation whereby the safety of the capital secured for investment in the industry will be protected by all the inviolability of a British Crown grant;

(b) To seek and secure adequate support for technical education and training to prepare for solving the problems incident to the development of the vast mineral resources of this country.

(c) To provide all possible freedom of investigation and certainty of investment in legitimate enterprises incident to the industry, and to make it recognized that in a free democracy it is inherently necessary to maintain watch and ward and corrective power over the hasty and ill-considered legislation inimical to the sound, legitimate and permanent interests of the industry;

(d) By our own voluntary effort, to justify a liberal expenditure on the plans of the various departments of the government for the development of the mineral resources of the country, and of the industries founded thereon, and to urge with all our weight and influence, and by all possible co-operation with the organization of other industries, the further prosecution of this governmental work along further and more adequate lines.

At this time, when reconstruction problems press upon us, when the mineral weath of the country eagerly beckons us to its adequate development as the surest and quickest road to that permanent industrial success, proved to be possible by the results of the past four years of munitionment effort; at this time when American capital is eager for investment in Canadian standards of character, initiative and energy; at this time, when the combination of these two elements of Canadian industrial success waits on the direction and energy of the Canadian mining institute, it is essential; it is imperative; it is the patriotic duty of the hour for us to see that the Canadian mining institute rise to its opportunity and speak for the mining industry in this country as the Canadian Manufacturers' Association, and as the United Farmers are speaking for their respective industries.

Our first consideration and duty is to convince the public that mining is one of our principal industries, on a par with agriculture and manufacturing, in fact that these three great industries are the basic pillars of our national industrial development.

CASEY MOUNTAIN SYNDICATE, LTD.

A contract for 200 feet of cross-cutting has been let on the property of the Casey Mountain property in the township of Casey, the working having been started recently.

According to official advice, the main shaft has reached a depth of 425 feet. During the course of driving the shaft a layer of diabase 320 feet in thickness was cut, instead of 270 feet as previously reported. Underlying the diabase is a layer of conglomerate ranging from 110 to 125 feet in thickness. Keewatin formation underlies the conglomerate. It is now proposed to carry out extensive lateral operations in the conglomerate formation.

The shaft was put down part of the distance on a strong fissure, which dipped out of the shaft, and which will be opened up in the present cross-cut. It is learned officially that commercial silver values were encountered during the course of work in the overlying diabase, average values of about thirty ounces, or some $30 to the ton being obtained at one point over a width of about ten feet.

The Casey-Mountain Mining Company, Ltd., with head office in Toronto, is the holding company, while the Casey-Mountain Syndicate, composed of interests in Regina, Sask., is the operating syndicate. Mr. R. G. Williamson is manager of the mine.

The mining plant on the property consists, in part, of a five-drill compressor, two boilers being 45 and 90 h.p. respectively, and a 6 x 8 hoist. The property consists of a group of claims comprising about 240 acres, and is situated about two miles from the rich Casey-Cobalt mine. A force of about ten men are engaged.

Not only is the geological structure at the Casey Mountain very similar to that found at the Casey mine, but is also very similar to that occurring in the most productive area of the Cobalt camp. Success would open a large prospective field, and one that should appeal to the larger mining companies, by reason of the fact that prospecting is made difficult owing to deep mining being necessary. It has often been said by leading mining engineers and geologists that the best place to look for new mines is in the neighborhood of proven mines. The Casey township area presents ample opportunity for putting the thought into actual practice.

INTERNATIONAL HIGH SPEED STEEL COMPANY EXTEND OPERATIONS.

To meet the requirements of their rapidly increasing business the International High Speed Steel Company have transferred their executive and main offices from 99 Nassau Street, New York City, to their works at Rockaway, N.J.

They have opened a branch office at Nos. 294-296 Lafayette Street, New York City, where they have secured a suitable and commodious warehouse.

The International High Speed Steel Company manufacture an extensive and varied stock of tool alloy and high speed steel, and also the celebrated "Bulldog" brand of Mining and Rock Drill Steel, both Hollow and Solid, in Hexagon, Octagon, Quarter Octagon, Round, and Cruciform Sections and in all sizes from ¾in. to 2in. diameter.

Mr. Wm. Garrow Fisher is president; Mr. Wm. T. Dunn, general manager, and Mr. John T. Mungovan, manager of the New York office.

They are represented in Eastern Canada by Mr. H. L. Usborne, Toronto, and in British Columbia by E. S. Prior & Company, Victoria, B.C.

SUNDAY STAKING IS LEGAL IN ONTARIO.

That a prospector may lawfully stake out a mining claim on Sunday, is the decision rendered by Mining Commissioner T. E. Godson, K.C., as is shown in a summary of Mr. Godson's decision, in the dispute of Knox versus Graham and Stevenson, printed in another column of the Journal. It is gratifying to note that Mr. Godson does not advocate nor does he encourage prospectors to stake mining claims on Sunday; but, that it is his opinion that where such is the case, the staking should not be made invalid owing to the operation of ths Lord's Day Act.

"A prospector who separates himself from the comforts and the protection of society; blazes a trail to unknown mineral zones and discovers mineral of value is serving not only himself, but the public at large, and no unnecessary restraint should be placed upon his activities," says Mr. Godson. Further, "I can appreciate one such, who, from absence of contact for an extended period, being excusably forgetful of the day of the week. I can also understand the necessity for haste when the grub-stake is running low and the distance between the prospector and point of supply many miles away," says the Commissioner.

Mr. Godson also says: "I confess a desire to abstain from finding that to stake a mining claim on Sunday creates an invalidity through the operation of the Lord's Day Act and yet I wish to be understood that Sunday should be observed as a day of rest and calm when the mind can be disconnected from worldly tasks. Nature, however, has its own quietening influence and it provides "Books in the running brooks; sermons in stones; good in everything."

Points brought out by the Commissioner, are these: In computing the time within which work must be performed on a mining claim, neither Sundays nor public holidays are excluded by the Act. A Miner's License is in force for twelve months, and during the duration of the license the licensee is unrestricted as to day or time, etc. In the case under review, the former claim reverted to the Crown at the first moment following midnight on Saturday, hence when Knox staked the ground on Sunday he was acting lawfully, according to the Mines Act.

INDUSTRIAL RELATIONS COMMITTEE AT COBALT.

The Industrial Relations Committee has concluded its labors in Cobalt. Among the points brought out might be mentioned the fact that before the war, the minimum wages in the gold mines was about $1.75 per day, as compared with a present wage of $3.50 per eight-hour day as the lowest paid underground workers at present. The eight-hour day is being generally recognized. The average wage paid for eight hours work in the gold mines is well over $4, while in the silver mines a like condition prevails. As an instance of this the Nipissing Mine may be cited, where, in the words of general manager R. B. Watson, the average paid to the employees of this, the largest silver mine in Canada, amounts to $4.34 for eight hours work.

Mr. Watson declared that he did not think it necessary to have an industrial council in Cobalt. He pointed out that as matters now stand, the employees of the mine have a committee which meets the management at intervals. The members of the committee are elected by the employees themselves, by secret ballot, and the system has proved successful. The attitude of the mine managers is made clear, and is this: they express their willingness to meet and to deal with representatives of their own employees and do everything to promote harmony and fair treatment, but they are not prepared to deal with the union, because it has its administrative head in a foreign country, and that it does not fully represent the majority of the mine workers of the camp, but, rather, represents only union members.

Chief Justice Mathers, when asked for an expression of opinion with regards the situation in Cobalt as compared with other parts of the Dominion so far covered by the Commission, stated that unrest was less pronounced in Cobalt than in certain points visited in the West.

After hearing the evidence presented from all parts of the district, and from various points of view, the situation in the mining districts has the appearance of being fairly favorable, and leaves the impression, that, after all, the chief bone of contention is not a question of wages and not conditions in general, but is due to the refusal of the International Mine, Mill and Smelter Workers Unions for failure to gain recognition.

The Dolly Varden Mine.

The Dolly Varden Mine, one of the most promising silver properties of the Alice Arm District, Northern British Columbia, is expected to be taken over by the Taylor Engineering Company. This concern constructed a railway from the Coast to the mine, which incidentally taps a number of other good prospects. The Dolly Varden Company failed to pay the Engineering Company all that was claimed for this work and, by virtue of legislation passed at the last session of the Provincial Legislature, the first mentioned company and the Temiskaming Mining Company, were given until May 19th to take care of claims amounting to $462,500. This they have not done apparently and the Taylor Engineering Company, therefore, has the power to take possession, its first responsibility on doing so being the discharge of wages due workmen amounting to about $150,000. This done the same concern has authority to proceed with the operation of the mine.

Special Correspondence

BRITISH COLUMBIA.

The Canadian Mining Journal issue of April 16, report of the Mining Committee of the B. C. Legislature regarding the Dolly Varden case was printed in full. In that report the Mining Committee decided that the Taylor Engineering Company, which met financial disaster in the construction of a railway from the Coast to Alice Arm, B.C., was entitled to payment in full of the cost of work done plus 10 per cent. contractor's profit. The committee took this position in order to protect the contracting company and its creditors before the Provincial Legislature should consent to the renewal of the railroad charter.

Under Bill 103 the Dolly Varden Company had until May 17th to pay wages and until May 22 to pay the balance of the claim. At this writing (May 20) the wages had not been paid and there were only two days more in which to pay the balance of the claim. If the balance is not paid on May 22, the Taylor Engineering Company are going to exercise the privileges conferred by Bill 103, and will then operate the property in accordance with the terms of the Bill.

The amount of the claim is $462,500. Mr. A. J. Taylor, of the Taylor Engineering Company states that his company is not in any way affiliated with any existing mining company and considers the property worth very much in excess of the charges against it. It is a high grade silver property on which over $1,300,000 has been actually expended up to the present time. The railway is fully equipped and the mine in full development with 2,000 ft. of tunnels.

Eastern B. C. Branch of Mining Institute.

Advantage is to be taken of the International Mining Convention to be held next month at Nelson, B.C., to launch an Eastern British Columbia branch of the Canadian Mining Institute. It also is stated that there will be a meeting of a joint committee to formulate a system whereby better co-operation will be established between the American Institute of Mining and Metallurgical Engineers and the Canadian Mining Institute. L. K. Armstrong, secretary of the A. I. M. & M. E. in a letter to F. A. Starkey, who is in general charge of the convention arrangements, states that E. P. Mathewson, New York, chairman of the A. I. M. & M. E., A. R. Ledoux, the member of the Canadian Committee, D. H. McDougall, Nova Scotia, and L. K. Armstrong, Spokane, along with W. G. Miller, Toronto, and R. H. Stewart, Vancouver, probably will be in attendance. Besides S. A. Easton, Kellogg, Idaho; P. N. Moore, past president of the A. I. M. E., St. Louis; J. H. Haas, chairman of the Columbia section A. I. M. E., and the president and secretary of the Associated Engineers, Spokane, Wn., are expected to be among the visitors. S. S. Fowler, Riondel, B.C., a member of the executive of the A. I. M. & M. E., is expected to advise the convention management as to the part of the technical portion of the programme the A. I. M. & M. E. will undertake.

To Conserve Gold Supply.

An extension of the existing Dominion prohibition upon the export of gold bullion, so as to include complex ore carrying gold, will be urged upon the Canadian Minister of Finance by the Vancouver (B. C.) Board of Trade. In discussing this matter one of the Board's members, Nicol Thompson, stated that the present legislation was designed to stabilize the country's credit and he thought the proposal was of the utmost importance, if results were to be assured. The greater proportion of the gold production of the Province was from complex ores and much of it was smelted at Tacoma, Wn., and other points outside British Columbia. It is proposed, as an alternative to the total prohibition of exportation that the Government make it obligatory that an amount of gold equivalent to the amount recovered outside the Province from provincial ores be returned to the exporting company. Such a policy, it was stated, besides making more effective the policy of increasing the country's gold reserve, might lead to the refining of all metallic ores in Canada.

B. C. Coal Output.

Coal output returns for the month of April are to hand and show that the total production of the collieries of British Columbia for that period was 197,180 tons. This is made up as follows:

Company.	Location.	Coal Tonnage.	Coke Tonnage.
Crow's Nest Pass Coal Co.	Coal Creek	26,788	337
Crow's Nest Pass Coal Co.	Michel	14,798	3775
Corbin Coal & Coke Co.	Corbin	5,315	....
Merritt Collieries, Ltd.	Merritt	3,300	....
Fleming Coal Co.	Merritt	2,604	....
Princeton Coal & Land Co.	Princeton	841	....
Canadian Western Fuel Co.	Nanaimo	54,825	....
Canadian Collieries, (D), Ltd.	Cumberland	51,037	....
"	Extension	19,326	....
"	South Wel'ton	6,574	....
Pacific Coast Coal Mines.	South Wel'ton	6,822	....

Nanoose Collieries Co.	Nanoose	135	....
Granby Consolidated Mining & Smelting Co.	Cassidy's	2,804	....
		197,180	4112

Multiplex Mining Co.

The Elove Mining Company, situated at Camborne, B.C., Lardeau District, has been bonded to the Multiplex Mining Company, the consideration being $30,000, according to the statement issued. The property has been in process of development by the owners, John Kennedy and Roderick McLennan, for some years and a vein of ore carrying silver-lead, with high values in

Obituary.

John Bates.

One of British Columbia's pioneer mining men died recently in the person of John Bates, who was well-known among prospectors and operators of the Kootenay and Boundary districts of this Province as well as in Alaska. On leaving the American Army, Mr. Bates migrated to Nelson, B.C., which he made headquarters while prospecting the adjacent country. Subsequently he journeyed to Alaska and the Yukon among the placer grounds, of which he roamed for several years. He then returned to the interior of British Columbia, where he has since lived. He was about 70 years of age, and a native of Ireland.

Silver Standard.

With the mine again on a shipping basis and the plant in operation, the Silver Standard property, Glen Mountain, Omineca, is expected to be active. Work was resumed on the 1st of May. This is one of the largest producers of silver, lead, and zinc of northern British Columbia, and is gratifying to know that arrangements as to freight rates, treatment of concentrates at the smelter, etc., have been satisfactorily concluded, and that there is every prospect of clear sailing for the management. W. G. Norrie-Loewenthal, the manager of the mine, who, of course, has returned to his duties, had a conference with General Stewart, D. McLeod, and Angus Stewart, some of the chief owners, while on the coast and states that they have every confidence in the future of the property and of the district, it being their opinion that other producing properties would be developed in the vicinity.

The O. B. U.

The "One Big Union" is much to the fore in the Canadian West. The idea of such an organization started with the Calgary Convention of the Federation of Labor and since has been discussed by practically every union in the West and, if reports are to be credited, has been generally endorsed, so that nothing remains but to give it effect. Among the leaders in the Crowsnest Pass Coal District it is, of course, the leading subject of discussion. Recently John Potter, of Fernie, and a member of one of the Locals, District 18, U.M.W. of A. addressed a meeting at Trail, B.C., held under the auspices of Trail Union No. 105, International Mine, Mill and Smelter Works, his theme being the One Big Union. He was on a mission, it was explained, to obtain members for the O. B. U. one of the primary objects of which was to secure a six-hour working day and a wage of $1 per hour. He deprecated the action of the Calgary Convention in expressing sympathy by resolution with the Bolsheviki doctrines, but asserted that the workingmen should get what they want by a nation-wide strike through the O. B. U.

Silver Standard.

The Silver Standard Mine is in full operation again. Ore is being taken out and development is being pushed. The Mill is handling the ore satisfactorily and a carload of zinc concentrates is ready for shipment. Lead concentrates are to be sent to Selby Smelter, San Francisco, Cal., instead of to Trail, B.C. The explanation given of this change is that the American smelter handles a lower grade of concentrates.

Federal Support for Technical Education.

Federal suport for technical education aggregating ten million dollars within the next ten years, the money to be paid to the provinces is provided for in the following resolution of which notice has been given by Hon. J. A. Calder, minister of immigration and colonization: Resolved that it is expedient:

(1) To bring in a measure for the promotion of technical education in Canada.

(2) That for the purpose of promoting and assisting technical education in Canada, the following sums, aggregating ten million dollars, shall be appropriated and made available for payment out of the consolidated revenue fund of Canada, during each fiscal year for the period of ten years, beginning with the year ending the 31st day of March, 1920, namely: (a) During the fiscal year ending March 31, 1920, the sum of $700,000; (b) During the fiscal year ending March 31, 1921, the sum of $8,000,000; (c) During the fiscal year ending March 31, 1922, the sum of $900,000; (d) During the fiscal year ending March 31, 1923, the sum of $1,000,000; (e) During the fiscal year ending March 31, 1924, the sum of $1,100,000 and the like sum of $1,100,000 during each of the succeeding fiscal years until the expiration of the fiscal year ending March 31, 1929.

Such sums subject to the conditions of the proposed legislation shall be allotted and shall be paid quarterly as grants to the governments of the several provinces in proportion to the population of the said provinces respectively, as determined by the last federal census.

(3) That the grant payable to any province in any year shall not exceed the amount provided for each province by the foregoing resolutions, nor shall it exceed an amount equivalent to that which the provincial government shall expend on technical education within such year.

(4) That in determining the grant payable to any province annually no account shall be taken of any liability of expenditure incurred by the province for the acquiring of lands, the erection or improvement of any buildings, or the supplying of furnishings or equipment for any technical education institution established in the province prior to the first day of April, 1919. Then follow the terms and conditions under which the grants shall be made.

Changes in Alberta Mines Act.

Some minor changes were made in the Mines Act of the Province of Alberta at the session which came to a close a short time ago. One amendment provides that the provisions of Section 29 of the Act shall not apply to mines where coal is extracted by the process of removing all the overlying strata. Section 29 deals with the control and supervision of a mine, making it obligatory that its operations shall be under the "control and supervision" of a certified manager and laying down rules and regulations the object of which are to enforce the keeping of underground workings in such condition as will assure their being safe to workmen. Another alteration provides for the semi-monthly payment of wages in coal mines as follows: "Wages earned from the 1st to the 15th day of each month shall be paid on the first Saturday after the 26th day of the same month, and all wages earned from the sixteenth day to the end of the month shall be paid on the first Saturday after the 12th day of the following month; provided that if any of the said Saturdays is

a holiday the wages shall be paid on the Friday before." The power given an employer to retain moneys due for doctor's fee has been repealed. Safety lamps shall be inspected by a person holding a first, second or third class certificate. The two persons appointed by workmen to inspect a mine shall be practical miners.

Granby Wage Increases.

Another advance in the wages of employees of the Granby Consolidated Mining & Smelting Company was announced recently at its smelting centre, Anyox. It amounts to 50 cents a day to miners and 25 cents a day to smeltermen and others, approximately 1,200 men being affected. This is in addition to a 25 cent raise a day for every 2 cents increase in the selling price of copper. Wages have been increased about $1 a day since April 1, when the plant was reopened after being suspended for some thirty days.

Paradise Mine.

A promising body of ore has been developed at the Paradise Mine, on Toby Creek, near Windermere, B.C. During 1917 over 2,000 tons of ore was shipped from this property to the Trail Smeltery, the nature of the ore being a lead carbonate with an approximate content of 30 oz. in silver to the ton and 30 per cent. lead. It is expected that the Paradise will be a steady producer during the present season.

Drilling Placer Ground.

A Keystone drilling machine is to be used in testing certain placer leases situated on Swift River, of the Cariboo District. The work is being undertaken by C. W. Moore, of the Waverly Mining Company. In the early mining days the Chinese sluiced over acres of the territory in question, taking out large amounts of gold. With the crude appliances in use then, however, the surface of the ground only was worked and the promoters of this enterprise are hopeful that the drill will reveal profitable ground at bedrock.

Manganese.

With further reference to the manganese claims situated in the Cowichan District, it is announced that the Tacoma Smeltery of the Burrows Alloys Co. has contracted to take twenty tons of the ore as soon as it can be got out. The ore will be supplied as soon as the road now under construction is completed. If there is a market for manganese at all C. H. Dickie and his associates are confident that the Vancouver Island ore will find a ready sale owing to its exceptional quality.

Fire at "Old Sport" Mine.

Fire broke out at the "Old Sport" Mine, Quatsino Sound, recently and destroyed the compressor house, besides rendering useless the electric light dynamo, the air compressor, and some $5,000 worth of miscellaneous tools and apparatus. The camp, which has been maintained by the Coast Copper Company on behalf of the Consolidated Mining & Smelting Co., has been closed down. It is understood, however, that the plant will be replaced as soon as possible and in the meantime the diamond drilling is to be continued. The "Old Sport" property is considered to be a large copper producing proposition in the making and on the proving of sufficient ore a concentrator is to be installed and a railway built from the mine to the beach. Up to the present the development consists of an adit which crosscuts the ore at a distance of about 400 feet from the surface, a drift along the ore body in each direction for 300 feet, a winze following the dip of the ore for 525 feet, and a drift in each direction at this level for about 300 feet. Besides there has been a great deal of surface work done and considerable drilling.

Dolly Varden.

According to authoritative information, representatives of the Dolly Varden Mining ompany, whose property is situated in the Alice Arm District, intends to appeal to the Dominion Government for the disallowance of the Provincial Legislation which gives the Taylor Engineering Co. power to take over the mine and other of the company's holdings in order to satisfy claims it has presented in respect of the construction of a line of railway from Alice Arm to the mine. It already has been reported that the time given the Dolly Varden Company to meet the financial terms laid down by the Legislature has lapsed and that the Taylor Engineering Company is proceeding to take possession.

District 18 Miners Strike.

The coal miners of District 18 (Eastern B. C. and the Province of Alberta) will strike on Saturday, May 24th, as a result of a disagreement which has arisen in the Crowsnest Pass Section of British Columbia over the pay of some employees who are affected by the Eight Hour Day law. There are about 6,000 men affected by this walk-out, of which number 1,600 are resident in the Crowsnest Pass, and the trouble centres in the wages of some 12 men. The company has conceded that the bulk of the surface workers whose day previously consisted of nine hours shall have the same pay for eight hours, but it refuses the same concession to fan men and others who have been working ten, and eleven hours a day. The Unions have had the matter under consideration for several weeks and, by an overwhelming majority, voted in favor of striking to uphold the claims of the workers instanced for the same daily rate of pay under the Eight Hour Day Act as has been received heretofore. Not only the miners, but all surface workers, including the engineers, have been called out so that the situation to the collieries throughout District 18 threatens to be serious unless some compromise can be reached without much delay. W. H. Armstrong, Director of Coal Mining Operations, is endeavoring to bring about a settlement and it is hoped that his efforts will be successful.

The British Columbia Federation of Labor recently telegraphed the Ottawa Government as follows:

Hon. G. D. Robertson, Minister of Labor, Ottawa:

"Executive of British Columbia Federation of Labor considers refusal of investigation into condition of men who, by Provincial Legislation are working eight hours in coal mines instead of eleven, and as a result have had their wages reduced, is similar in effect to the cause of the Winnipeg strike. Unless something is done for these men the Federation will be compelled to render support in case of strike in the only way possible. Have no desire to see any trouble in the West and consider the only way in which a strike can be averted is by granting an investigation."

NORTHERN ONTARIO.

Matachewan Gold Mines.

According to mining men just returned from Fort Matachewan district, a rich lens of ore has been encountered at a depth of about 80 feet on the Otisse property of the Matachewan Gold Mines. Visible gold, it is said, has been found to occur in spectacular quanties. The outlook for the property appears to be quite encouraging, and, as a result, enthusiasm is growing. The general inclination among property owners is to await further developments, yet there is increasing evidence that a large amount of work will be proceeded with on properites lying close to the Otisse.

The Cyanide Supply.

At the conclusion of his visit to Cobalt, Porcupine, Kirkland Lake and Boston Creek, Mr. Neill, of the Cassel Cyanide Company of Glasgow expressed himself to the Journal as being much impressed with the great headway made during recent years, particularly at the gold mines. Mr. Neill was especially impressed with the efficiency of the mining engineers throughout the district, and appeared to be of the opinion that Northern Ontario was entering into a great period of prosperity.

Concerning the supply and the cost of cyanide, it was pointed out that the supply was now equal to the demand, and that the price had declined more than five per cent., with indications of still further decrease.

Kerr Lake.

A dividend of 25 cents per share will be paid June 16th to shareholders of the Kerr Lake Mining Company, of record June 2nd. This will call for the disbursement of $150,000, and is the second to be made this year. Total dividends paid by the Kerr Lake since the first disbursement on October 4th, 1905, amounts to $8,310,000, inclusive of that just declared.

McKinley-Darragh.

The McKinley-Darragh dividend of 3 per cent. payable July 1st, to shareholders of record June 7th. The disbursement will amount to $67,428, and is the third to be paid so far this year.

The first dividend payment on the McKinley-Darragh was made on March 1st, 1907, since which time a total of $5,551,879, has been paid, amounting to 250 per cent. on the company's issued capital. The company attained the peak of its prosperity in 1913, during which year some 46 per cent. was disbursed in dividends.

The Gillies Limit.

It is learned on good authority that it is quite probable the Ontario government will not open the Gillies Limit for prospecting this year. The government has looked with favor on the suggestion that the Limit be opened this summer, but after making due investigation, feels that it is perhaps only fair that the owners of the Limit should be given the coming winter in order to remove the timber.

The general feeling at the government's probable failure to open the Limit this year will no doubt be one of disappointment, yet mining men and prospectos may reasonably be expected to be among the first to agree that such is the only fair thing for the government to do.

Many returned men are understood to be renewing acquaintances with the Gillies Limit territory, and when the time comes to lift the ban, some of these men will perhaps be in possession of much useful information.

Dome Mines.

The annual meeting of the Dome Mines Company will be held about June 10th. The directors will visit the mine about June 4th or 5th, both in connection with the Dome Extension property as well as the Dome Mines. The favorable developments at the 600-ft. level of the Dome Extension lends considerable weight to the growing belief that the Dome will exercise its opinion on the Dome Extension prior to March of next year. The president of the Dome is expected to make a more or less open statement with regard to the probable trend of developments during the next few months.

$50,000,000 From 50 Acres.

A block of fifty acres of territory lying immediately adjacent to The Square, in Cobalt, has yielded approximately $50,000,000 worth of silver, or an average of about $1,000,000 per acre. There are other sections in the Cobalt camp that can lay claim to a somewhat similar record, yet in no other part of Northern Ontario is there so large a compact block of fifty acres, which has yielded such an aggregate value of precious metal.

The fifty acres referred to is owned in part by the Coniagas and in part by the Nipissing.

McKinley-Darragh.

Despite the fact that the 250-ton oil flotation plant at the McKinley-Darragh has been set in operation at full capacity, and that production during recent months has been considerably higher than during 1918, the company has found it possible to reduce working forces to the extent of about ten per cent.

Arrangements are now being made to explore the south-eastern part of property, which lies adjacent to the Nipissing mine and not far removed from that area where the Nipissing encountered such favorable results in vein No. 109. The McKinley has a small conglomerate area here which has been only partly explored. Several years ago a cross-cut was driven into this area from the 250-ft. level of the main workings, but the work was discontinued before the promising area was thoroughly explored.

Nipissing.

The Nipissing Mining Company has declared a dividend of 5 per cent. together with a bonus of 5 per cent., payable June 21st, to shareholders of record June 30th. The company is capitalized at $6,000,000, and the July disbursement will amount to $600,000.

The Nipissing is the largest dividend payer among the precious metal mines of the Dominion, having paid its first dividend on July 20th, 1906, since which time a total of $19,140,000 has been paid, including that payable in July. The company commenced the current year with ore reserves of 6,000,000, since which time developments have been favorable and point toward the reserve being increased during this year.

Silverton Miners Want Six Hour Day.

At a recent meeting of the Silverton Miners' Union it was decided to endeavor to obtain a six hour shift as a day's work at the rate of pay of $1 an hour.

Miller Independence.

At the 100-ft. level of the Miller Independence Mine at Boston Creek, a rich body of ore has been cross-cut. At the time of writing a width of about sixteen feet has been exposed, with the face of the cross-cut still in ore. Tellurides of gold are said to occur, and while assays have not yet been taken, it is evident the gold content will be high.

The contract for clearing the right of way for an electric power transmission line has been let and the work will be commenced within the week. Transformers placed on order several weeks ago are due for delivery about the middle of June. Several carloads of material and equipment for a big new reduction plant, including a roasting plant, are due for delivery within a reasonably short time and the road from the station is to be improved preparatory to hauling the large amount of material.

Dome Mines.

It is stated, unofficially, that mill heads at the Dome Mines are running as high as $9 to the ton. While it was learned in semi-official circles some time ago that the management intended to treat ore for the time being with an average of about $7 to the ton, it is considered not improbable that a certain amount of $9 ore may be going to the mill.

Hollinger.

Former employees of the Hollinger Mine, who enlisted for overseas service are being given their old positions. Not only this, but they are also being given their promised bonus of 100 shares of Hollinger stock. One of these returned men stated to the writer that the treatment accorded the Hollinger employees, and the working conditions, are of the best, and that every facility was being provided to assist in the efforts of the most ambitious or energetic to get ahead and increase their income.

The minimum wage underground is $4 for eight hours, but where the energetic worker so desires he is permitted to do work by contract and in this way increase his income. In not a few instances, this is being taken advantage of. As in the case of the returned man referred to above, an average of upwards of $5 is being earned for each eight hour day.

Kirkland Lake Miners' Demands.

Under date of May 27th the representatives of the Kirkland Lake branch of the International Mine, Mill and Smelter Workers Union presented a demand to the mine operators of Kirkland Lake, asking for a forty-four hour week instead of forty-eight hours as at present. They also ask for recognition of the Union, for full day's pay on Saturday for four hours work, and a minimum of $4.50 per day for all underground workers. The mine operators are given ten days in which to consider the matter.

The view of the mine operators appears to be that the present high cost of living demands that every workman should be paid as high a wage as is possible, but in view of the heavy economic strain under which gold mines are being operated, it would scarcely be possible to shorten the number of working hours or to increase pay. To this, of course, there may reasonably be found isolated exceptions, but, on the whole, such appears to be the general view.

Teck-Hughes.

According to information from Kirkland Lake, a considerable quantity of high grade ore has been encountered in the Teck-Hughes mine. The new orebody is understood to contain average values well above that of ore heretofore developed.

In view of the fact that the average value of the ore treated during April amounted to $10.46 per ton, the present favorable developments holds out the promise that the average heads may be increased to a point second only to the adjoining Lake Shore mine. While full details as to the extent and average gold content of the new orebody, definite information is lacking, but some of the ore is reported to run as high as $30 to the ton.

CHICAGO MEETING A. I. M. M. E.

Plans for the meeting of the American Institute of Mining and Metallurgical Engineers at Chicago next September are assuming definite form, and the Committee in charge announces the following schedule of events.

On Monday, September 22nd, the opening day, the morning will be devoted to registration of members and guests at the convention headquarters, the Congress Hotel. Monday afternoon the first session for presentation and discussion of technical papers will be held, and in the evening a Smoker, at which the committee guarantees all traces of glaciation will be dissipated.

It is planned on Tuesday to make an excursion in a body, by a boat chartered for the occasion, across the south end of the lake to Gary, for a trip through the famous steel mills. Wednesday will be devoted to technical sessions, morning and afternoon, and in the evening the banquet will be held at the Congress Hotel, at which all members of the Institute and their wives will be the guests of Chicago.

On Thursday, a special train will convey the members and guests to La Salle and Depue, Illinois, where the zinc smelteries, coal mines and cement works will be visited. For those to whom these industrial operations are not of particular interest—this may include many of the ladies—there will be a trip by automobile to Starved Rock and other points of historical interest in the vicinity of La Salle.

For Friday, the 26th, several optional excursions have been planned to local industrial plants. One trip will take in the lead refineries at East Chicago and the Standard Oil Refinery at Whiting. Another excursion will be to Milwaukee, to the plants of the Allis-Chalmers Company and the Power and Mining Machinery Company; this trip will also include the metallurgical works at North Chicago of the Fansteel Products Company where their novel electrothermal processes in the production of metallic tungsten, molybdenum, cerium, and tantalum will be demonstrated.

For those interested in coal mining it is planned to have an excursion to the fields in Franklin and McCoupin Counties, leaving Chicago late Friday evening and spending Saturday at the mines.

Florence Silver.

The retiring board of the Florence Silver Mining Company was re-elected at a recent meeting of the stockholders held in Ainsworth. The board is composed of F. R. Wolfe, president and manager; A. F. Kelly, vice-president; D. E. Saunders, secretary-treasurer; J. A. Lavender and A. M. Frost.

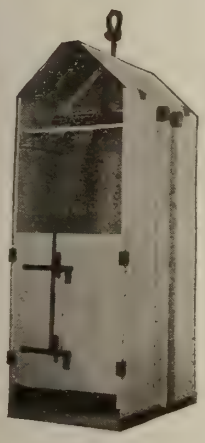
SAFETY MINE CAGES

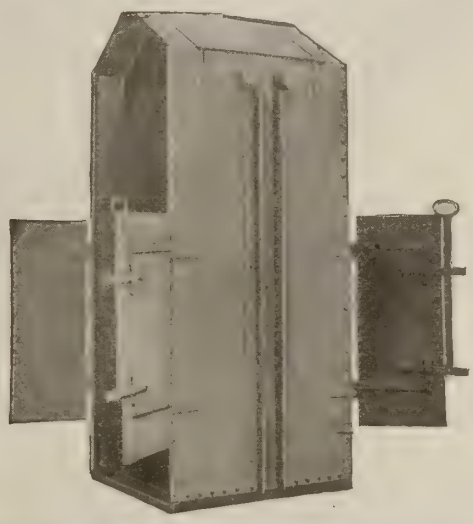
MADE TO FIT YOUR SHAFT

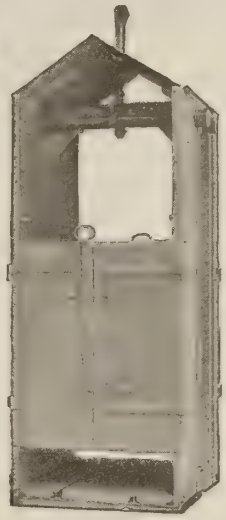
We build these Cages to suit you and your workmen. They are Safe, Strong, and Reliable.

¶ The top doors permit the carrying of long timbers, or the escape of the men in case of accident.

¶ The hand rails are properly placed to safeguard the passengers in the quick ascent or descent.







¶ We supply these cages with either one or two sets of doors for inlet or exit, to suit your shaft.

¶ Rails are also laid in the floor, if required, for convenience in handling the cars.

MARSH ENGINEERING WORKS, LIMITED, Established 1846 **BELLEVILLE, ONTARIO, Canada**

Sales Agents: MUSSENS, LIMITED, Montreal, Toronto, Winnipeg and Vancouver

WANTED.—A Canadian manufacturer of machinery for the use of Contractors, Miners, etc., is open to undertake the manufacture of any other machinery or device for the use of either Contractors or Miners, and invites correspondence with holders of Canadian patents, or with U. S. concerns desiring a Canadian manufacturing agency. Liberal inducements also offered for successful suggestions regarding machinery or other articles that can be manufactured and sold in connection with the above mentioned lines. Address Box 2, Canadian Mining Journal.

FOR SALE—Mining Property to be sold, with Mill and Machinery Shafts, the latter recently re-timbered, roads all in good order. Has yielded half an oz. of Gold to every ton crushed. Railway within 4 miles. Owner over 80 years of age; cannot superintend working. Apply John Witherow, Central Rawdon, Hants Co., Nova Scotia.

KLIM—

Powdered Separated Milk —is best for Mining Camps

The problem of securing a constant supply of natural-flavored fresh milk is best solved by using Klim. Klim is made from the purest separated milk by removing the water from the milk solids by the "spray process," which is the most modern method of drying milk into powder form. Klim remains sweet and fresh under every climatic condition. It will not turn sour even after the tin is opened. To convert into liquid simply add Klim to water and whip until dissolved. It gives the natural milk flavor to cooking and baking, tea, coffee, cocoa, etc. A ten pound tin makes 40 quarts of pasteurized separated milk.

Order a case (6 ten-pound tins) from your supply house.

Mining Corporation.

The Mining Corporation has stopped exploration work on the property acquired some few months ago in the south-eastern part of the township of Bucke. At a depth of about 300 feet some lateral work was done, three veins being cut. In no case, however, did they carry commercial values, with the result that work for the time being at least has been stopped.

The Cowichan Manganese Deposits.

Towards the end of the war announcement was made that a considerable deposit of manganese had been discovered in the Cowichan District, Vancouver Island. The news created much interest in mining circles and also received general attention because of the need of the mineral for munition purposes. Since then a report has been published by G. C. Mackenzie, formerly of the Dominion Geological Survey, on the deposits which speaks highly of the showings, but regrets that more development did not take place between the date of the record and that on which the report was written. Since then C. H. Dickie, one of the owners, who has had some work done, states that some of the ore uncovered certainly contains silver values, but to what extent has not yet been established, the assay returns not having been received. Without question it is a large deposit of ferro-manganese and in this lies its economic value. Enough work has been done with hand steel, he asserts, to prove that the ore carries its high manganese content well below oxidation. Mr. Dickie, with the aid of the Provincial Government, is now preparing to build a road up the mountain side. A satisfactory grade has been obtained, there being a raise of 1,800 feet in a distance of three and one-half miles. Over this road it is proposed to take caterpillar trucks with a trailer to transport the ore to rail. When the property has been further developed and there is more ore in sight the transportation problem should be solved by the installation of an aerial tramway, the conditions for the use of this method being ideal.

THE ROMANCE OF SILVER.

A silent battle is being waged between those who require silver and those who represent the producers. Such is the opinion of interests in close touch with the precious metal situation. The white metal having once more been placed on a solid footing and the price being regulated by the law of supply and demand, the consumer is apparently withholding bids until the last possible moment in an endeavor to induce the producer to throw his product on the market at going prices. Likewise, the producer appears to be waiting competition on the part of those desiring to purchase, with the result that a silent test of endurance, so to speak, is taking place. The present peculiar situation adds still further to "the romance of silver." Like the mystery that surrounds the screen at the close of each episode of serial photoplays so hangs the element of mystery about the white metal. What will be the next move in the quotations for commercial bar silver?

Boston Creek.

One of the most interesting developments in the gold districts is the development of a high grade orebody measuring upwards of sixteen feet in width at the Miller Independence. The ore is exceedingly rich in gold tellurides and has caused much enthusiasm in the Boston Creek district. In a general way, both in the proven gold mining districts and in the prospective field, activity is increasing steadily and the former anticipation of one of the busiest summers on record in this part of Northern Ontario is already being realized.

PERSONALS.

Mr. T. R. Jones, superintendent of the Buffalo Mines, together with his family, are taking up residence in New Wilmington, Pa. Mr. Jones will continue general superintendent of the Buffalo, and will pay a visit to the mine at regular intervals.

Mr. Frank Loring has returned to Toronto after examining properties at Boston Creek.

Mr. W. R. Rogers is at Kirkland Lake, making a topographical map of the area.

Mr. A. G. Burrows and Mr. P. E. Hopkins are making geological examinations at Boston Creek.

Mr. J. B. Tyrrell is at Kirkland Lake.

Mr. Geo. Rogers has returned to Toronto from Wasapika.

Mr. Harwood, who has been recently in Los Angeles, is again at the Schumacher Mine. Mr. Harwood was in charge of the La Rose Mine for several years.

Mr. A. R. Whitman has been examining properties in the West Shining Tree gold area.

Mr. H. C. Crow, President of Cartright Gold Fields, Limited, is leaving the west on a combined business and pleasure trip to England and the Continent. He is being accompanied by Mrs. Crow.

The Carmi Mine.

Seattle and San Francisco interests are said to have an option and bond on the Carmi Lode Mine, Carmi, B.C. A compressor will be installed at once and considerable work done this summer. A new mill may be erected. As the ores of this mines have a copper base the starting of the Greenwood smelter would stimulate the development of the Carmi and other mines of the vicinity.

Oxy-Acetylene Welding and Cutting

Cutting ⅜ inch Sheet Steel Piling (including lock joints 2¼ inches thick) by the Prest-O-Lite Process.

One Man Does the Work of Two In Less Time, at Less Cost

This illustration shows one man, with a Prest-O-Lite blow-pipe cutting ⅜-inch sheet steel piling, used in the construction of the protection piers of a large drawbridge. This one man handled the entire job, cutting an average of seven feet of piling per hour—an enormous saving over the old slow and costly method of sawing, which required the services of two men.

Prest-O-Lite PROCESS

offers splendid opportunities for substantial savings in manufacturing, construction and repair work.

Prest-O-Lite Oxy-Acetylene welding and cutting is opening the way to construction and repair operations which cannot be performed by any other process.

Employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders, for empty ones. Provides dry, purified gas insuring better welds, quicker work and lower operating cost.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the process quickly and easily. There is practically no line of metal manufacturing or repairing in which oxy-acetylene welding has not already established itself firmly as standard routine method.

Write for valuable illustrated literature and data on work others are doing by Prest-O-Lite welding process. It may point out ways to solve your problems.

THE SYMPATHETIC STRIKES.

The sympathetic strikes which we have had recently in various centres in Canada cannot be considered to be remarkably successful from the standpoint of the strike promoters. They have served a useful purpose in directing attention in a forceful way to the widespread discontent caused by the high cost of living. They have at the same time demonstrated that the general public will not submit to the dictatorship of radicals who would turn government upside down if they had their way.

Strikes have their place in the industrial world. If it were not that they are so often accompanied by unnecessary violence and destruction of property we would welcome them occasionally, for they often bring discontent to the surface and lead to desirable improvements in conditions. Strikes are undoubtedly Labor's most powerful weapons and no class need ask that Labor be deprived of its weapons so long as they are used in fighting for a good cause. We would protest against the sympathetic strike because it is obviously a misuse of weapons, an attempt to gain selfish objects by imposing indiscriminate hardships on the rest of the community. We do not wonder therefore at the reception given to these strikes in Canada. The recent action of the Metal Trades Council in advising sympathetic strikers in Toronto to return to work is a sign that the strikers themselves are not overly enthusiastic.

WAGES AND HOURS.

Miners at Kirkland Lake and Cobalt are making demands on their employers for higher wages and shorter hours. These are matters that should naturally be adjusted by arbitration between employers and employees. There are two sides to the question.

The miners are doubtless aware that conditions at present in Ontario gold and silver camps are much brighter than in many mining districts in North America. They will do well to consider whether they should not do their best to hold the jobs they have. If they make unreasonable demands they may so change conditions that there will be few opportunities for profitable employment. Gold must be sold at the standard price regardless of cost of production and where the margin is small the sure result of increase in cost is obvious. Moreover, there must be a very considerable profit on operations in order merely to return capital invested and a moderate amount for the use of the money.

The profitable mine must in addition return a considerable amount to bear the cost of exploring and developing other properties, many of which prove to be "lemons." The profitable companies pay directly for only a very small part of the cost of searching for and developing the other properties; but indirectly they must pay if the industry is to grow as it has in the past. In the hope of developing a very profitable mine, men spend money in very considerable amounts on promising properties. They lose more often than they win. They would surely not continue if there were no hope of large profits. There would then be no new mines developed and the miner would be in little demand. It is obvious that the miner profits more surely than does anyone else as the industry develops. It is up to him therefore to take care that his demands be not unreasonable. He should demand a fair share in the profits of the industry; but so long as others bear the cost of all the unprofitable ventures he should not be disgruntled if a few of these ventures-some ones are successful. In fact, he would have more occasion for discontent if there were no prizes to lure the adventurer into new fields.

The miner may reasonably demand good wages and an eight hour day. He should also have the Saturday half holiday if he wants it and is willing to give something for it. The actual wage must be determined by conditions that are partly local and partly general; but in our opinion general increase in wages at present would give no permanently good result. What is more needed is co-operation between employers and employees to fight the increasing cost of living. Advance in wages may be necessary to relieve the situation temporarily. In fairness to the miner the wages must keep pace with increased costs. It is not surprising that the miner desires to get a lap ahead in the race, but that is not sufficient excuse for keeping him a lap behind.

We have no sympathy with the idea that industry should not be carried on for profit; but if it were, it would be found that there is no great profit in the mining industry at present. There are notable successes which obtain much publicity, and there are countless failures in which the public takes little interest. If the miners owned all the prospects and mines and worked them on a mutual profit sharing plan, they would find that their present wages would appear much larger than when they compare them with the profits of a few successful companies.

The miners can fairly demand that they should receive for their labor, wages that will enable them to bring up their families in reasonable comfort and provide their children with such education as will make them good and useful citizens. If the present wages are insufficient to give labor reasonable cause for satisfaction, demand for increase is a natural consequence. It then remains to be determined whether the industry can stand the increase. There is no doubt that a few mines could be operated at a profit even if wages were much higher; but the answer to the general question is not so simple. We shall be disappointed if it is found that the industry cannot flourish while enabling the miner to earn a decent living.

WORKING HOURS IN NOVA SCOTIAN COLLIERIES.

Before the Royal Commission on Industrial Relations which completed its tour of Canada by a recent sitting in Sydney, C.B., the President of the United Mine Workers in Nova Scotia outlined to the Commission the decision of the miners to obtain a five days week with eight hours daily work, and announced that "ultimately they hoped to get a six hour day and a substantial increase in wages." This system the Local President of the U. M. W. of America thought "would act as a cure for unemployment as a large number of men not now at work would be absorbed."

We have every sympathy with the desire of miners to ameliorate their living and working conditions, but surely the responsible leaders of men do not believe their employment can be increased by decreasing working hours and increasing wages, or, in other words, by the process of adding to the cost of coal to the consumer? The reason for any lack of employment in Nova Scotian collieries at the present time lies in the high cost of coal production there, and the consequent limitation of the radius in which Nova Scotian coal can find a market. There is really no overproduction of coal anywhere to-day. Over-riding everything, and only temporarily obscured by the unrepresentative conditions of the coal market that momentarily exist, is a world shortage of coal. The only place where there is no local shortage is North America, and probably nowhere in the world can coal be mined so cheaply and in such abundance to-day as in the United States.

The amount of employment available at Nova Scotian collieries is decided by the competitive prices of United States coal in Canadian markets. If Nova Scotian coal is now unsaleable at a profit in Montreal, how will much shorter hours and a substantial increase in wages provide additional employment?

Over eighty per cent of the coal now mined in Cape Breton comes from undersea areas. What would a six hour day mean in a submarine colliery? Possibly not more than four hours work at the coal-face. How could coal be produced and sold at a profit from submarine collieries under such conditions?

Further, it should be noted, that coal lies at the base of our industrial structure, and that every manufacturing process and all transportation charges must bear the burden of increased coal-selling prices. It would be interesting to know just how much of the increased cost of living is directly and indirectly attributable to the increase in the price of coal to the consumer. We suspect the bulk of it is so attributable, and if the coal miner insists upon demanding preferential treatment in his work, and hours of work and wages which are out of proportion with those of his fellow-unionists it must inevitably result in lessened employment and increased living costs for everybody.

The maintenance of a gold standard of currency and coal production are very closely inter-related, so inter-related in fact that every increase in the cost of coal to the public is equivalent to a depreciation of the currency value, and it is perhaps time that we should stop talking of the high cost of living and should discuss the depreciation of the dollar. It may be demurred that coal is not any more basic than other essential commodities, such as wheat and food stuffs generally, and from the standpoint of physical existence that is correct. From the standpoint, however, of monetary values, there is nothing to-day that is so fundamental as coal selling-prices, and that is why the wages and hours of labor of coal miners are of greater importance and of wider effect than might be inferred from a comparison of the number of men engaged in coal mining with those engaged in all other industrial pursuits.

EXPLOSION OF BLACK POWDER IN THE BALTIMORE MINE OF THE DELAWARE & HUDSON AT WILKESBARRE.

The newspapers record the death of 83 men and the serious injury of 50 others by burning and violence through the explosion of seven kegs of black powder in the Baltimore Tunnel of the Delaware & Hudson at Wilkesbarre. The powder was being conveyed into the mine in the same trip that carried men to their work by means of an electric trolley road. The accident is, so far as we know, a unique one. Newspapers accounts of mine accident are not always to be wholly relied upon, but the combination of a workmen's train a large quantity of black powder, and a bare overhead electric trolley-wire, is one that is not conceivable in a coal mine operated under the regulations of most civilized countries.

The use of black powder in a coal mine is in itself scarcely excusable, and it is surprising that the practice should still be permitted. The advantages of black powder, and it has some advantages, do not out-

weigh its danger. The use of overhead trolley systems in collieries in the United States has always been a source of astonishment to British mining engineers, although their convenience and economy are very great. The conveyance of black powder in a workmen's train was not only inexcusable but unnecessary. Explosives cannot be carried on ordinary passenger railways, but the conditions of confinement in a colliery tunnel would cause a much greater potential danger than any conceivable conditions above-ground.

Collieries will never become comparatively safe places — they can never be entirely safe — until naked lights of all descriptions are prohibited. Naked lights may be considered to include any sparking or danger of sparking of electric appliances, the use of any form of blasting except "permitted" powders and electric detonators, and, of course, the use of all open lights such as acetylene torches and unenclosed oil lamps.

We shall await with interest the comment of United States coal journals on this disaster, and the more exact details which will be presented at the enquiry.

SUBMARINE COAL LEASE QUESTION IN NOVA SCOTIA.

Text of Recent Act.

The Legislature of Nova Scotia, during the session recently prorogued, passed an act "to legalize and validate an Order-in-Council respecting a Certain Coal Area in Cape Breton," which conveys to the Nova Scotia Steel & Coal Company the right to enter upon the leased areas of the Dominion Coal Company abutting upon the north side of the area leased by the Scotia Company and forming the territory tributary to the workings of the Florence Colliery. The permission given is limited to a distance of one thousand feet in width by approximately 5,000 feet in length, and has the effect of increasing the area tributary to the Florence Slope by a parallelogram of that extent.

Compensation to the Dominion Coal Company is to be paid under the arbitration clause of Chapter 16 of the Acts of 1918, and such compensation will be in addition to the usual royalty of 12½ cents per ton on the coal mined and sold from the transferred area, which the Scotia Company will pay to the Government.

The validation of this Order-in-Council was regarded by the Nova Scotia Government as merely a measure of temporary relief to the working conditions of the Florence Colliery, and at the recent session of the Legislature an act was passed giving to the Government general powers to deal with the submarine coal tracts so as to assure as far as possible that these tracts shall be worked most advantageously and in the best interests of the Province. The text of the Act is as follows:

1.—The Governor-in-Council may whenever he deems it expedient appoint two or more persons, of whom the Commissioner of Public Works and Mines may be one to be commissioners to inquire into and concerning whether any worked or unworked submarine coal mining area now held under lease and subject to the provisions of the Mines Act, can, if unworked by advantageously worked or if worked be more advantageously worked in the best interests of the Province by some other leasee of coal mining areas that are subject to the provisions of the "Mines Act," and to report thereon to the Governor-in-Council with any recommendation such commissioners may think fit.

2.—For the purpose of any inquiry such Commissioners shall have all the powers, privileges, authorities and immunities of a Commissioner appointed under "The Public Inquiries Act" passed at the present session of the Legislature.

3.—Notwithstanding any of the provisions of any act of the legislature of Nova Scotia and notwithstanding any lease of coal mining areas heretofore or hereafter issued under authority of an Act of the Legislature of Nova Scotia, the Governor-in-Council on the report of such Commissioners is authorized and empowered to make such orders and regulations as he may deem expedient for the purpose of ensuring that such submarine coal mining area shall be worked in the best interests of the Province, and for greater certainty but not so as to restrict the generality of the foregoing terms of this section it is hereby declared that the Governor-in-Council may by Order-in-Council, vest in any leasee of any coal mining area that is subject to the provisions of the "Mines Act" any submarine coal mining area that is so subject and is held by any other person as lessee.

4.—When any such area is vested, as aforesaid, the person in whom the same is so vested shall hold the same subject to the same terms and conditions and covenants upon which it was held immediately before being so vested and on such other terms and conditions as the Governor-in-Council deems expedient.

5.—Compensation shall be made by the person in whom such areas are so vested to the person so divested of such areas and the same shall be determined by the Governor-in-Council and may be according to such method and on such basis as he deems expedient and without restricting the generality of the foregoing such method and basis may be in one or more of the following ways or partly in one way and partly in another, namely:

(a) vesting as aforesaid of areas in one person in satisfaction in whole or in part of those vested as aforesaid in another person:
(b) a payment of a fixed sum in cash or in instalments; two hundred and forty pounds of coal which may be mined from the area so vested;
(c) a payment or royalty per ton of two thousand and two hundred and forty pounds of coal which may be mined from the area so vested;

6.—The compensation for any area so vested shall stand in the stead of such area so vested, and any claim to or encumbrance thereon shall as respects the person in whom the area is so vested be converted into a claim to or upon compensation and shall no longer affect such area; provided that where such compensation is wholly or in part in cash the same may be paid to the Prothonotary of the Supreme Court at Halifax, and the same may be paid out to the person or persons entitled thereto on application to a Judge of the Supreme Court who may make such orders and direct such notice to be given as he deems necessary to protect all persons interested in the cash paid to the Prothonotary as aforesaid.

7.—This Act shall not apply to any submarine coal mining areas now held under lease dated 1st day of April, 1893, entitled "An Act for the further encouragement of coal mining."

The Act, which was brought down as a Government measure, was moved by the Hon. Commissioner of Mines, Mr. E. H. Armstrong, in an exhaustive speech of some three hours in duration which showed that the Commissioner had devoted to one of the most important matters that ever come before the Nova Scotia Legislature the attention and research that the delicate and involved question of the undersea coal leases deserves.

A perusal of the Act will show that it is not a confiscatory or extremely radical measure, and that it aims only to empower the Government of Nova Scotia to transfer the right to mine coal from undersea leased areas upon payment of proper compensation.

Clause 7 of the Act excepts from the provisions of the Act the so-called "blanket lease" of the Dominion Coal Company, which is a lease of the various properties consolidated and incorporated into the Dominion Coal Company's areas at the time of the formation of the Company in 1893. This lease contains special covenants inhibiting the Legislature of Nova Scotia from enacting future laws that would lessen the value of the properties contained in the "blanket lease."

It is of course, well known that the action of the Government arises out of the undersea areas question as it affects the Dominion and Scotia Companies, and it has been publicly announced by the Commissioner of Mines that the appointment of a Commission under the powers conveyed by the Act will not be made until it shall have proved impossible to arrange an adjustment of the undersea areas by private negotiation between the two companies concerned. It is understood that, at the request of the Nova Scotia Government, committees from the Boards of Directors of the Dominion and Scotia Companies have already been in conference with this object in view, but so far no information has been given to the public by either company as to the progress of the negotiations. —F. W. G.

REPRESENTATIONS OF THE NOVA SCOTIA STEEL COMPANY

In Connection With the Extraction of Coal From Under-sea Areas:

The technical side of the representations made by the Nova Scotia Steel & Coal Company in connection with the extraction of coal from the undersea coal tract off Sydney Harbour is contained in the following excerpts from a letter addressed to the Commissioner of Mines of Nova Scotia. After referring to the manner in which its collieries are specifically affected, the Scotia Company states:

"Without attempting to detail all the present and future hindrances to the successful extraction of coal brought about by the two companies owning leases which interfere with each other's mining operations, we believe the situation may be summarized by stating that the configuration of the mining areas as defined by the present lease line imposes upon the always difficult engineering problem of successfully mining coal from seams underlying the sea unnecessary and additional hardships, both in regard to the physical difficulties of approach and extraction, and the cost of mining.

The consequences of the existing situation are, and will be, in part as follows:

Duplication of Expenditure and Waste of Effort.

If the Nova Scotia Steel & Coal Company, for example, should decide to win coal from the leases it holds off Lingan Head; or if, conversely, the Dominion Coal Company should extend its operations to the Sydney Mines side, it will necessitate a duplicate expenditure in railways, shipping piers, colliery equipment, shaft-sinking, and other outlays inseparable from the development of collieries, of an entirely additional and completely unnecessary character.

There will also be other expenditures of a municipal character, such as accompany the development of a community, including water-supply, houses, streets and schools. The major portion of these expenditures will fall upon the operators, who will, of course, be the largest ratepayers.

There is no manner in which these unnecessary and duplicate expenditures can be recouped except through the selling price of coal, and eventually, the public will pay for a proceeding that is inadvisable in every interest as well as unnecessary.

The coal companies are also the largest ratepayers in the existing municipalities, or in other words, they are the largest shareholders in the existing municipal investments.

As the existing municipalities decline, therefore, so will the bulk of the liabilities fall upon the coal companies, who will at one and the same time be required to support declining municipal finances, and also to bear the brunt of new and unnecessary outlays for the creation of mining communities, which can only have an ephemeral existence, because they will be brought about by the attempt to build upon the essentially unsound basis of duplicate exploitation of the coalfield inseparable from a perpetuation of the existing arrangement of leases.

Increased Costs of Mining.

Apart from the permanent burden on the cost of mining coal which would be occasioned by the duplicate expenditure just mentioned, any attempt to mine coal in conformity with the existing lease lines must heavily increase the cost of mining the undersea coal-seams. The conditions imposed by the intervention of leases held by other than the operating company prevent the projection of future workings under the sea in the manner and in the order that ordinary mining practice would direct.

Anything that increases the difficulty of mining coal also increases the cost.

Limitation of the Life of the Submarine Coalfield.

The point where the extraction of coal from under the sea will become impossible by reason of physical limitations is unknown. There is, however, another limitation to undersea coal-mining, that of cost, and it is self-evident that this limitation by cost will be reached at an earlier date by a retention of the difficult conditions of mining occasioned by the lease lines than it will be if mining is carried on in a natural way.

You are without doubt aware how great is the proportion of the coal reserves of Nova Scotia that is contained in the undersea areas. It is most desirable that the maximum yield should be obtained from the sub-

marine tracts, and it is apparent that the more natural, and in consequence the less costly is the method of mining used, the greater will be the income which the undersea coal will yield in royalties.

In other words, the amount of coal recoverable from the undersea coalfield will be decided by the costs of mining, and anything that tends to increase these costs will lessen the amount of coal profitably recoverable.

An Endangering of the Accessibility of the Remoter Undersea Coal.

In those cases where the leases of undersea areas cover territory adjacent to the shore, but do not permit of access to leases held by the same operator lying further out to sea because of the intervention of the holdings of another lessee, it is to be expected that when the immediately available territory is exhausted, except as regards the coal left standing in pillars, that these pillars will be drawn in retreating order commencing at the deepest extension of the pillar workings, which will thereby cut off the access to the outlying coal, and render the extraction of the remoter coal difficult, if not entirely impossible, because of physical problems, and certainly quite impossible as a commercial enterprise.

The foregoing conclusions do not exhaust by any means the possibilities of serious damage to the future of the submarine coalfield, but we believe they are sufficient to indicate to you how real and pressing is the danger."

In confirmation of its statements, the letter of the Scotia Company quotes extracts from a report made in 1877 by the late Dr. Henry S. Poole, at that time Chief Inspector of Mines for Nova Scotia, a document which the "Journal" believes is of sufficient present interest to justify its reproduction in the next issue. The gist of Dr. Poole's recommendations is contained in his statement that "instead of allowing distinct individuals to take out leases of areas, one beyond the other, it would undoubtedly have been better and more conducive to the interests of the country to have restricted each lease to a certain frontage on the adjoining coast."

NORTHERN MANITOBA MINING CO.

The Northern Manitoba Mining Company, with a capital of one million, divided into one milling shares of one dollar each, is a local enterprise, almost entirely officered and financed by Pas people. The company's property comprises three gold claims situated at Herb Lake. Machinery to the value of $12,000 has been installed, consisting of a 40 h.p. boiler, two drills and compressor, with blacksmith shop, and several buildings. A shaft was sunk to a depth of 120 feet, and the values, it is sttaed, held all the way down. Last spring a carload of ore was sent to Trail, and the smelter returns gave $81 a ton. The mine operated for a short time only, when, on account of the lack of funds, it closed down.

The president of the company is Mr. H. S. Johnson, manager of the Armstrong Trading Company, and the secretary is Mr. R. Kerr.—The Pas Herald.

WEST SHINING TREE.

The Foisey claims at West Shining Tree have just been placed under option to the E. J. Longyear Co. of Sudbury, Ont., and Minneapolis, Minn. The Millar-Adair, north of the Foisey, has been purchased by Isbell, Plant and Co. The Wasapika gold mine adjoins the latter further north, and all these properties are on the great Ribble vein.

THE ABSORPTION OF SILVER BY INDIA.

A writer in the Boston News Bureau says:

As the Orient was willing to accept silver in place of gold or commodities furnished the Allies during the war, it was to the interest of the United States and the allies that foreign trade balances should, as far as possible, be settled in silver rather than in gold. It was better, also, than by stabilizing exchange or raising-credits. The latter expedients only defer the final settlement in gold. The settlement of the Oriental balances in silver during the war represented a definite settlement, calling for no future adjustment.

Normally, India had an adverse trade balance of about $90,000,000 before the war, but by the end of 1917 the balance is said to have grown to nearly $400,000,000 in her favor. London could not satisfy this Indian demand and so Lord Reading was sent over here in 1917 to induce the United States government to come to the aid of Great Britain with our store of silver dollars, the only supply in the world left available.

According to official figures, India has absorbed, since April 1913, 1,200,000,000 silver rupees, about 404,166,000 ounces, or roughly, $400,000,000.

How seriously the situation is viewed in Britain is gathered from the following remarks delivered recently by Sir James Meston, the financial member of the Indian government, in his budget speech:

"Few would suspect the forbidding portals of the finance department of harboring a romance, and yet the whole story of how Sir William Meyer and his trusty henchmen held the gate against inconvertibility and its attendant woes, and of how our old friend Sir James Brunyate fought our battle simultaneously in Washington—the whole story is as good as any romance to those who, like myself, were anxiously awaiting the situation from London. It seemed from week to week an utter impossibility that the government of India could possibly escape from the suspension of specie payments, and yet the feat was accomplished, and India owes no inconsiderable debt of gratitude to those whose skill and tenacity averted the misfortune.

"The crisis, however, has a lesson and that lesson is that we are on permanently unsafe ground until India is educated up to abandoning its habit of hoarding money in unsettled times. India's reputation as the sink of the precious metals is an unhappy one, and we all trust that in time she will outlive it. Meanwhile, government cannot possibly go on meeting the insane demand for silver rupees, which disappear from circulation as soon as they are minted, without serious effects on the world price of silver, already far too high for comfort. There is absolutely no justification for the continuing panic which has drawn 1,200,000,000 silver rupees from our mints during the last four years, and unless it is checked and the hoarded coins restored to circulation we may be forced to reconsider the whole basis of our currency and exchange policy."

When the Federal Reserve Board removed the ban on silver exports, the action was accepted everywhere as heralding the beginning of a new era in silver. "Silver has come into its own," people said. "India needs silver, China needs silver, the world needs silver. Europe must have silver to fortify its paper inflated currency. There cannot be other than a soaring market for silver."

Such were the optimistic beliefs expressed generally, excepting in bullion circles. There, experts know, what most people overlook, that silver is a commodity, the

market for which, like few others, is subject to government necessities. In the absence of any definite knowledge as to future government demands, dealers refused to share in extravagant predictions as to how high silver is apt to go with the export ban lifted.

Seventy-five per cent of the annual silver production has been going to India—the Sink, as it is called; for there it stays and disappears from view. As one silver authority put it, "It is the market for the other 25 per cent production that is expected to govern the price of the whole 100 per cent. If you will tell me what the Indian government is going to do about silver now, I could give you some idea of where the price of silver is going."

India has always been the enigma of silver. But is more than ever so today. It is impossible to get bullion dealers to prognosticate. They deal in only a small proportion of a market—the greater part being at the uncertain disposition of the Indian government; for you cannot ship silver into India without the authority of the Indian government.

"When people tell you," said this silver authority, "that silver is bound to go sky high under present conditions, it is fair to ask them whether regarding that 25 per cent of open supply, or that 75 per cent of India's usual quota. And you will not find anyone who is able to tell you definitely what India is going to do about silver.

"India's absorption of silver is as much a matter of fancy as of trade. It is much easier to gauge the price of a commodity, like wheat, because there we have something that represents a definite human demand.

"As the Indian demand for silver has been most intense for the past two or three years, I think my guess as good as anybody's when I say that if there is to be any change at all in the Indian silver demand, it will be lessened."

If this expert's opinion proves to be the case, the silver outlook would be complicated by the fact that, other things being equal, more than the usual 25 per cent of the production may find its way onto the market.

WASAPIKA GOLD.

Toronto, June 6.

Developments at the Wasapika are stated to be shaping up in a highly favorable manner since aggressive work was resumed early in the year. Manager Geo. R. Rogers, who left for the property last night, stated that the shaft, which has been sunk west of the Ribble vein, has reached a depth of about eighty-five feet and that the showings in the bottom are very encouraging.

While the shaft was sunk some eighty feet away from the vein, it has been proven that gold values permeate the rock over the full width between the shaft and the vein, indicating a very extensive ore body.

It is planned to continue the sinking of the shaft at the Wasapika till the 100-foot level is reached. At this point a station will be cut and a cross-cut run to test out the vein at this depth. The shaft will then be continued down to 200 feet.

The deepest shaft at Kalgoorlie, Western Australia, is at the Ivanhoe mine, which is bottomed at 3,620 ft. Reserves are 1,000,209 tons of $8.16 ore.—Mining & Scientific Press.

INTERNATIONAL NICKEL.

In his remarks accompanying the annual report, President Bostwick, of International Nickel Co., says it is futile to attempt to forecast conditions that will obtain throughout the current fiscal year.

"There are certain important factors in the consuming markets, both here and abroad," he says, "that must be reckoned with that are temporarily adverse in character, such as the hesitant condition of industry generally, until the definite consummation of the peace treaty; the presence of large stocks of metal and scrap metal, both in governmental and private possession; the embargoes against imports in foreign countries, the difficulties of financing and exchanging in the foreign markets and the possibilities of some restrictive measures as to armaments or trading freely in raw materials being incorporated in the peace treaty.

"On the other hand the company's plants, mines and ore reserves are in splendid physical condition, and there has been provided a capacity badly needed by the company to enable it to advance the uses of its various specialty nickel and Monel metal products for commercial uses. Moreover, with increasing growth in the use of alloy steel an increased consumption in that quarter can be looked for."

Mr. Bostwick says in the first eight months of the fiscal year, up to the signing of the armistice, the company's operations were conducted at full capacity and under the greatest possible pressure for maximum production. The completion of the Port Colborne refinery and the Copper Cliff smelter permitted the company's output to keep pace with the constant increase in the demand for nickel from allied governments. Almost the entire production was used for government purposes and little was available for ordinary commercial lines.

Following the armistice the demand from the various governments was greatly curtailed and this required a rapid adjustment of output. At the close of the fiscal year, March 31, plants were operating about one-third of capacity.—Boston News Bureau.

At the annual meeting of the stockholders of the International Nickel Co., at Bayonne, N.J., the retiring directors were re-elected.

The board met and organized by re-lecting the officers. No successor was chosen for the vacancy created by the death of the late Captain J. R. Delamar.

In a recent issue the depth of the Ooregum mine, on the Kolar goldfield, in India, was given as 5,380 feet. A later report, just to hand, states that two shafts, the Oakley and Bullen, have reached the 60th level, which is $5,419 feet vertically below the surface. The Ooregum exploits an ore-shoot, or series of nearly parallel ore-shoots, on its pitch northward from the Mysore and Champion Reef mines. These properties, so successfully managed by the old and honorable engineering firm of John Taylor & Sons, have been highly productive since 1883. They were first explored by white men in 1871, when an Irish soldier, named Lavelle, began to prospect on the site of ancient workings, which were 300 feet deep in places, notably on the Mysore ground. Last year this group of four companies, all under the same capable management, produced $10,029,000 worth of gold.—Mining & Scientific Press.

Mines Are Not All Profitable

Ninety Per Cent. of Earnings in Successful Northern Ontario Mines are Paid Out in Wages and Materials.

By J. A. McRAE.

In those days of reconstruction, when the nationalization of certain of the industries of the nation are moot questions, it is interesting and may possibly be instructive, to review the position of the precious metal mines. In a sense, the statement that the cost of producing gold ranges between $30 and $40 per ounce may sound ridiculous when it is considered that gold has a standard value of but $20.67 per ounce. The fact is that where one gold mine is brought to a point of profitable production there are scores of mines that do not share so desirable a fate, with the result that nearly twice as much money is spent on gold mines than the value of the total output.

Any one familiar with the mining industry of Northern Ontario and the large amount of capital being spent annually on the mines can clearly realize that during 1918, when only three gold mines and but ten silver mines paid dividends amounting to an aggregate of $6,819,880, the interest return on the capital involved must be lower than the interest return on the capital invested in any other industry. Indeed, were it not for the fascination of mining, presenting as it does opportunity for large reward to the successful, the business of mining would not be the important national asset that it is to-day. While it would be comparatively easy for an organization or a government to subsidize the existing profit yielding mines and realize a profit for the benefit of the state, yet it is a fact that such a condition would cease with the working out of the present mines, for the reason that the cost of prospecting, exploring and developing new mines would be greater (as shown by facts of history) than the value of the precious metal produced. In a word, the nationalization or the subsidization of the precious metal mining industry does not appear feasible, and if the industry is to flourish, as there is every indication that it will, then the mining of silver and of gold must be left to private or individual effort.

In connection with the silver produced in Cobalt, statements have been made that the mining companies get $9,000 out of every $10,000 produced. While to mining men such a statement is known to be utterly erroneous, yet among those not altogether familiar with the facts, reference is often made to such "an unfair division of the result of man's labors." Therefore, in order to prevent the spread of such absurd stories, it might be well to present the facts, which are these:—

In the year 1918, which was the second best year in point of value of production in the history of Cobalt, the mines of the camp produced a total of $17,290,826, of which $4,948,348 was paid in dividends, the balance of $12,342,478 being absorbed in costs of labor and supplies. During the same year the gold mines produced $8,567,178, out of which $1,871,542 was paid in dividends, leaving a balance of $6,695,636 to defray the cost of labor and supplies.

The total output, therefore, of the silver and gold mines was $25,858,004, of which a total of $6,819,890 was paid in dividends, as against a cost of $19,038,114 for labor and supplies. In dealing with these figures it is well to remember that the dividends paid, as above shown, represent the return on thirteen companies having an aggregate capital of $67,050,000, and that the interest on this capital amounted to about ten per cent. So much for the successful mines. But, where one mine makes good there are generally scores of failures. Northern Ontario is no exception, and while $25,858,004 was being produced in 1918, and while the disbursement of $6,819,890 was being made on the involved capital of $67,050,000, the unsuccessful mining company were spending sums of money in an effort to make good, this expenditure unquestionably exceeding the profit derived from the successful mines.

Then, too, who are the recipients of the dividends paid? To this there is but one answer: The shareholders of the stock companies operating the mines. At this point another interesting condition arises. The shares of these companies are held by scores of thousands of men and women. Among them are a large number of the mine workers of Northern Ontario. Indeed it would probably be a revelation to know the large total in dividends being collected annually by wage earners in this country and the United States who are shareholders in the mining companies.

With regard to the statistics to which reference has been made in this article, the following figures are presented, which show a complete list of the mining companies in Northern Ontario which paid dividends during 1918, showing the capitalization of each company, and the amount disbursed in dividends. The scores of non-dividend-paying mines are not shown for the reason that they are so numerous and could not be included in any alleged unfair division of wealth, unless it should be that the shareholders might complain against unfair cost of labor and supplies as compared with the value produced:

Company.	Product.	Capital.	Divids. paid in 1918.
Buffalo	(silver)	$ 750,000	$ 250,000
Coniagas	(silver)	4,000,000	500,000
Hollinger	(gold)	25,000,000	1,230,000
Kerr Lake	(silver)	3,000,000	600,000
La Rose	(silver)	7,500,000	30,000
Lake Shore	(gold)	2,000,000	100,000
Mining Corp.	(silver)	8,300,250	1,380,751
McIntyre	(gold)	4,000,000	541,542
McKinley-Darragh	(silver)	2,000,000	269,712
Nipissing	(silver)	6,000,000	1,800,000
Penn-Canadian	(silver)	1,500,000	40,491
Seneca-Superior	(silver)	500,000	2,394
Temiskaming	(silver)	2,500,000	75,000
Totals		$67,050,250	$6,819,890

NORTHERN ONTARIO.

Since the resumption of work early in the year at the Tough-Oakes Mine, development work has added greatly to ore reserves. It is understood from six to eight months ore is now in sight as compared with practically no reserve at the time of closing down last summer.

The mill has not yet been set in operation, it being the intention of the management to concentrate effort toward development work until such time as there can be no likelihood of running out of ore during any period in which development work failed to add to reserves. According to late advice from the mine, a new vein has been encountered in a cross-cut on the Burnside property, which is to be concluded in a merger with the Tough-Oakes. This vein was discovered during the course of connecting the underground workings of the two properties. The consolidated properties bid fair to soon be producing gold at a rate equal or perhaps in excess of the banner days of the Tough-Oakes before the shortage of labor and high cost of supplies caused the big slump in gold mining during the closing months of 1917 and the whole of 1918. Prior to that time the Tough-Oakes was producing as high as $60,000 per month.

Percy Hopkins and A. G. Burrows, members of the permanent staff of geologists of the Ontario Bureau of Mines, are in the Boston Creek field making a study of conditions there. The amount of work done in the district since the last government report was issued a few years ago makes it possible to prepare a more detailed may and should convey a better idea to the mining public of the big potentialities of the new camp.

The gold tellurides which occur on the Miller Independence are being tested.

An encouraging discovery of gold has been made on the Wickstead property, situated a short distance to the east of Bourke's siding, according to reports just brought out by prospectors.

The case involving a strip of territory lying along the boundary between the O'Brien Mine and the Violet property of the La Rose Mining Company has been concluded, judgment being reserved.

A good deal of work was done on the Violet by the La Rose prior to the time of the dispute concerning the correct location of the boundary. The main shaft, as well as a part of the mine buildings are located on the strip of territory involved.

Among some of those who heard a good deal of the evidence presented at the hearing, the opinion appears to exist that no matter what the decision may be, an appeal to another court is not improbable.

The Sullivan property, situated in the township of Maisonville, near Sesekinika, is to be diamond drilled this summer, according to word just received. The property received a good deal of attention several years ago owing to the discovery of a narrow vein being opened up with spectacular showings of gold.

The return of interest to this area is the logical result of increasing interest in gold mining after the war.

A diamond-drill hole put down near the north boundary of the Miller Independence Mine has penetrated an ore body about sixteen feet in width at a depth of 103 feet. The hole was put down by the company owning the adjoining property to the north, it being planned that the drill would pass onto the Cullen-Renaud property at some little depth. Permission had been granted allowing the machine to be set up on the Independence. The ore body, although encountered near the north boundary of the latter company's property is dipping at an angle of about fifty degrees to the south and is considered to be of very considerable importance to the Miller Independence.

According to information just to hand, not only is it proposed to operate the old Keeley Mine in South Lorrain in an aggressive way, but the controlling interests also are evincing a desire to secure additional property in that district.

During the exploration and development work carried on several years ago in the South Lorrain area, quite a number of large veins containing a good deal of cobalt, with low silver values were opened up. While these veins at that time were of questionable commercial value, it is thought the present higher value of silver might reasonably make them worth mining. And, as a consequence, mining interests are taking new interest in the field.

Dr. Merchant, superintendent of Technical Education in Ontario has concluded a visit to the Haileybury Mining School. Mr. McLaughlin, assistant director of Technical Education also paid a visit to the school.

Arrangements are being made to hold the formal opening within the next few weeks, Hon. Dr. Cody, Minister of Education as well as Hon. G. Howard Ferguson being invited to be present for the occasion.

Arrangements are to be made, it is understood, to provide a mining course for returned soldiers, including assaying, milling, cyanidation, flotation, surveying, etc. A number of applications have already been received.

On June 7th, the Hollinger Consolidated Gold Mines will disburse a one per cent. dividend to shareholders of record June 7th. The disbursement will amount to $246,000, and is the third of like amount to be paid this year.

The Hollinger paid its first dividend in 1912. Total disbursements since that time, including the June dividend, amount to $10,162,000. The net earnings are now well above requirements for 1 per cent. every eight weeks, and it is generally expected the rate will shortly be increased to 1 per cent. every four weeks, which was the rate up until a couple of years ago.

Interests in control of the Murray-Morgridge property, at Wolfe Lake, are stated to have made the necessary financial arrangements to resume operations at a very early date.

A small plant was installed about two years ago, and a limited amount of development work done, during the course of which some commercial ore was opened up in a wide vein. An endeavor is now being made to carry out a more or less extensive development programme.

Shorter Hours and Increased Wages Asked by Cobalt Miners' Union

The Miner's Union has shown a tendency to press for demands for shorter hours and increased pay, as well as recognition of the Union in the northern mining camps, including Cobalt, Boston Creek, Kirkland Lake, Porcupine and Gowganada.

A strike vote is to be taken Sunday, in view of the mining companies having not seen their way clear to grant the demands. The Union has asked for a forty-four hour week, and a minimum underground wage of $4.50, with time and a half for overtime, and double time on Sundays and legal holidays.

Although a strike vote is to be taken, and although there appears to be some possibility of the majority of the union members (which does not represent a majority of the mine workers), voting in favor of a strike, yet there is a feeling that a strike may not be actually called. The belief is growing that should a majority vote be secured, the union might hesitate to strike, and might prefer to request the government to appoint a commission to decide the matter. However, as to this, it would be folly to make a prediction and only the passing of time will determine the outcome of the present controversy.

The letter and wage scale as presented to the mine managers of Cobalt, follows:—

Cobalt, June 2, 1919.

To the Mine Managers,

Dear Sirs,—In accordance with instructions received from a mass meeting of the members of the Cobalt Miners' Union No. 146, held in the Grand Theatre, Cobalt, yesterday, June 1st, we received instructions to visit the mines of the Cobalt Camp and deliver the enclosed demands from the Cobalt Miners' Union. We attach the motion as passed for your information. You will observe by reading the motion that a reply is asked for within forty-eight hours and in order to avoid delay, preparation were at once undertaken to permit of a strike vote being taken on next Sunday, June 8th, should no satisfactory progress be made this week by way of reply or negotiations.

Copy of motion carried at yesterday's meeting:—

"That Executive Committee of the Local Union, visit the Mines of the Cobalt Camp to-morrow, June 2nd, and present our demands as adopted by this meeting and also at last Sunday's meeting; that the Mine Operators be given forty-eight hours in which to reply and that in the meantime, preparations and printing be instituted at once to take a strike vote next Sunday, June 8th, provided no satisfactory reply or adjustment be made in the required time."

Trusting you may see your way clear to confer in regard to the enclosed demands, we are,

Yours truly,

(Signed) JOSEPH GORMAN, Secretary, and others,
Executive Committee, Cobalt Miner's Union.

Following is wage scale adopted by Cobalt Miners' Union, Local 146, exclusive of bonus, concerning which a rider is attached at bottom of this scale.

Underground Men.

Minimum base wage for all underground men irrespective of their trade or line of work	$4.50
Men working in raises and shafts (no helpers)	5.50
(With rubber boots and oilers.)	

Surface Men.

Deckmen	$4.00
Deckmen, over sinking operations	4.50
General blacksmiths and all steel sharpeners	5.00
General blacksmiths and all steel sharpeners' helpers	4.50
Carpenters	5.00
Mechanics	5.00
Mechanics helpers	4.50
Hoistmen and engineers	4.50
Firemen	4.00
Compressor men	5.00
Pipefitters	4.50
Pipefitters helpers	4.00
Pump men	4.50
Diamond drill runners	5.00
Diamond drill helpers	4.50
Rockhouse men	4.25
All surface laborers	4.00

Mill Men.

Solution Men	$5.00
Roll and battery men	5.00
Repair men	5.00
Repair men helpers	4.50
Table men	4.50
Tuke and Ball men	4.50
Filter men	4.50
Flotation men	4.50
Press men	4.50
Jig men	4.50
Dryer men	4.50
Oilers	4.50
General mill laborers	4.00
Electricians	5.00
Electrician helpers	4.50
Lathe men	5.00
Motor men	4.50
Cooks, with room and board; per month	$135.00
Cookees with room and board; per month	85.00
Teamsters, with room and board; per month	90.00

In addition to above wage scale, bonus to be paid on price of silver as follows:

When the average price of silver is at or over 80 cents per ounce, a bonus of 25 cents per shift to be paid to each employee, and an additional 25 cents per shift for each ten cents per ounce above 80 cents average price.

In no case shall more than $1.00 per day be charged for board in company boarding houses, based on above wage scale. If more must be charged, wages to be raised correspondingly to cover the difference.

Eight hours per day to be maximum work day for all employees, both underground and on surface, with Saturday half holiday, with full pay, commonly called the forty-four hour week.

In case of underground men the eight hours per shift to be from collar to collar and not at the working face.

Time and a half for overtime and double time for Sundays and all legal holidays.

Recognition of the Union with collective bargaining and the check-off system.

MAGNITUDE OF TEMISKAMING PRODUCTION.

Despite the fact that what is now known as the district of Temiskaming, has been an important silver and gold mining district for more than a dozen years, and that a total value of $175,000,000 in silver and about $49,000,000 in gold has been mined, it is a remarkable fact that ore reserves now actually left in sight amount to about $125,000,000. From past experience it is probable many scores of millions will be added to reserve during the course of mining the gold and silver ore now in sight. Thus, value already produced and value actually in sight makes a total of approximately $350,000,000. Added to this is a good deal of evidence that would indicate that production has not yet reached the maximum, and that the thousands of miles of territory as yet practically unexplored may be found to contain as great or perhaps even greater deposits of precious metal than those so far opened up.

Altogether something like 11,666 tons of silver and about 120 tons of gold bullion has been taken out. Estimating each car to contain an average of about thirty-five tons, the output of silver would fill about 333 cars while the output of gold would amount to 120 tons and would fill amout three and a half cars. The total would make up close to seventeen trainloads of twenty cars to each train. When it considered that a good deal of the silver ore does not yield more than about one pound of silver to each ton of ore treated, and that an average of less than half an ounce of gold is taken from each ton of gold ore treated, it can readily be realized the tremendous tonnage necessary to yield seventeen train loads of bullion.

Further, in mining hundreds of thousands of tons of ore, it has been found necessary to handle scores of thousands of tons of waste rock. The whole process has necessitated several score miles of drifting, or cross-cutting, tunnelling and sinking — always in the solid rock — so extensive being the workings that if they were placed end to end it would constitute a tunnel through solid rock nearly from Cobalt to Toronto. There are a number of the mines each of which have done more than twenty miles of underground work.

Mining men and prospectors recently returned from the Skead township district report more activity in that area than since 1913. Several gold finds have been made, some of which bid fair to be of importance.

The shaft of the Wiscon-Skead has reached a depth of 100 feet, at which point a station is being cut, and arrangements being made to do some drifting.

In the past few weeks the position of silver has been reversed. Where the maximum price recently prevented an increase in quotations, that barrier has now been removed, and, instead, a minimum price of $1 an ounce has virtually been fixed. The reason for this belief is the fact that the treasury of the United States is to be restocked at a price of $1 an ounce for silver, to the extent of perhaps one-quarter of a billion ounces. The silver producers, therefore, appear to be assured of a favorable market for their product for a good many years to come.

In the aggregate the mining industry of the north never appeared to command so much attention as now. British and American interests appear to have awakened to the enormous potentialities of Northern Ontario, and there are indications that a large volume of much needed capital will be made available during the next few months for the exploration and the development of mineral deposits in all parts of the country.

A. H. Brown, mining inspector for this district, has recovered from his recent illness, and has resumed his duties.

C. H. Porrier, of New York, is making an examination of the Cullen-Renaud property, of the Allied Gold Mines.

J. M. Wood, of Toronto, is in the north on business.

W. E. Gowans, late of the C. E. F., and formerly of the staff of the Dome Mines, has been engaged as mine captain at the Miller Independence.

Frank L. Culver, president of the Beaver Consolidated, is in Kirkland Lake in connection with the Kirkland Lake Gold Mines of the Beaver Company.

C. D. Kaeding, manager of the Dome Mine, will return to the north this week from New York.

MINERALS SEPARATION.

Washington, June 5.

United States Supreme Court in the case of Minerals Separation, Ltd., vs. Butte & Superior Mining Co., has reversed the Circuit Court of Appeals of San Francisco in its holding that the patent covering the so-called flotation process is limited to one half of one per cent, or less of oil.

It upholds the contention of Minerals Separation that the patent covers any fraction of one per cent of oil. The case was remanded to the District Court of Montana for decree and accounting.

A well-known English coal periodical, commenting on the proceedings of the Sankey Coal Commission, remarks that it does not necessarily follow "because a man is good enough for a seat on a Commission he is fit to manage a mine."

The comment is acid, but it is meticulously accurate.

POWDER EXPLOSION ON UNDERGROUND TRAIN.

Wilkesbarre, Pa., June 5. — Sixty mine workers were killed and forty others injured at the Baltimore No. 2 tunnel of the Delaware and Hudson Company, near here, early to-day. A car of black powder attached to a train of cars on which the men were riding to their chambers in the mine exploded. An electric motor drew the cars. The trolley wire broke and sparks ignited the powder. Men were blown everywhere, but most of the deaths were caused by fire and suffocation.

MANITOBA MINING NEWS.

(From "The Pas Herald.")

The copper ore stored at Rocky lake is being brought to The Pas, unloaded into teams and transported across the town to the railway cars. The water in The Pas river is too low to permit of barges getting up to the ore docks. The ore is being brought down at the rate of 100 tons daily.

The Herald is advised that an interesting announcement will shortly be made in connection with the great sulphide ore body at Flin-Flon. Negotiations are taking place in New York between the owners and American capitalists.

The Pas Consolidated, the Rex and the Northern Manitoba, are three properties at Herb lake it is hoped will get going sometime this summer. At present there is nothing more than current reports of their intentions to prosecute active mining. Lack of funds is an ailment common to all three.

W. J. Young, mining broker states that he has received far more inquiries for mining properties this spring than at any previous period. Gold claims appear to be in greater demand than sulphide properties. He finds the situation very encouraging.

C. W. Greenlees is in from Schist lake with a story of a new sulphide ore discovery on the north end of that lake. Samples of ore were shown, and the stuff is something similar to the Flin-Flon ore. The finders are Pete Davidson and Baptise Lavasseur. The location of the strike is exactly on the tip of the lake end, west of the Pineroot river, and well in line between the Mandy mine and the sulphide ore deposit at Flin-Flon. Six claims were recorded on this strike.

An important discovery of silver-lead ore is reported by Mr. J. P. Gordon, ex-chief engineer of the H. B. R. It was made on a claim near Copper lake, in the Athapapuskow area, and the ore body is said to be large and well defined. Mr. Gordon brought an assortment of the ore to The Pas, and it is noted that he is the first one to cross the numerous lakes at such an early period as May 12th. He found the ice all gone from them.

A. L. Stewart and Bob Hassett have two claims on the N.E. arm of Lake Athapapuskow, about a mile and a half in from the shore, with a vein of chalcopyrite, measuring from 8 to 10 feet wide, and assaying 10 per cent copper with small gold and silver values. The vein is stripped for 60 feet, and a hole four feet deep sunk across it in one place. Considerable development was done during the last three months, and the owners are elated over the showings.

J. A. Cameron, of Regina, is another owner of claims at Athapapuskow with excellent showings. On one claim there are three open cuts, with 10 per cent copper showings. No. 1 is 50 feet long, 10 wide and 10 deep; No. 2 is 20 long, 8 wide and 4 deep; No. 3 is 30 long, 6 wide and 14 deep.

The ice in Athapapuskow went out on May 10th, the earliest period in years. Reports reach The Pas that all northern lakes were free of ice about the 10th of May.

THAT TECK-HUGHES VEIN.

Kirkland Lake, June 5.

The acting manager of the Teck-Hughes invites the author of the story that the mine a few days ago discovered $30 ore to come up and show the vein to him.—Toronto World.

FIXING THE WORLD'S SILVER PRICE.

Boston—Four dealers in Oriental exchange, meeting daily at the London Metal Exchange, determine the world's price for silver metal, and upon the basis so fixed the New York dealers and producers arrange their own market price.

An exception existed during the period when the Washington authorities, working in conjunction with the British Government, fixed the price and regulated the international movement. This step was taken in order that India's requirements might be supplied from American treasury stores.

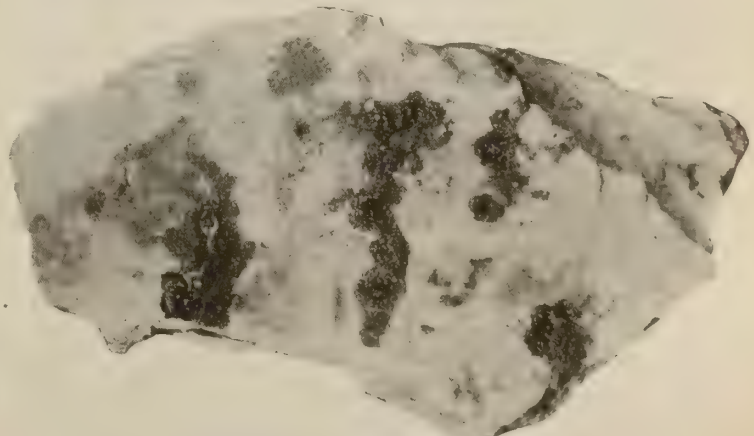
London for many years controlled the copper market as well as the prices for lead, spelter, tin and silver. Through the organization of the Copper Export Association in New York and the breaking up of the German metal combine, the copper market control has reverted to this country, where it always belonged.

The United States is the largest individual contributor to the world's silver yield, and the producers have in mind, it is understood, the establishment of means necessary also to fix the price.

While London, handling India's requirements, dominates the greatest consumptive field for silver, New York actually controls the production.

The past fortnight has shown positively that London still controls in price fixing as it has been practically impossible to secure quotations on silver until after London cables have been received. Owing to the speculative influence abroad silver, since its release from government control, has had a rise of nearly 20 cents an ounce followed by a reaction of 15 cents.—Boston News Bureau.

Apropos of the occurrence of elaterite, or elastic bitumen, in a fluorite vein at Madoc, Ont., reported in the Journal recently, it may be interesting to recall that an occurrence of this rare mineral was reported by Professor Boyd Dawkins as occurring near Castleton, Derbyshire (Eng.) in the Carboniferous Limestone, not far distant from the site of the reported finding of petroleum in one of a series of boreholes which are being put down by the British Government. The consensus of the most eminent geologists of Britain has been that a search for oil in Derbyshire, was, as one veteran inspector of mines said, "the wildest of wildcat schemes."



"Elaterite" or Elastic Bitumen.

The Iron Industry in British Columbia

From Our British Columbia Correspondent.

The development of the iron ore deposits of British Columbia is a problem very prominently before the Provincial Government. During the past two months preparations have been made by W. M. Brewer, resident mining engineer with headquarters at Nanaimo, B.C., to ship ore from some of the at present non-producing properties to small smelters situated near Vancouver City for the purpose of experiment. Mr. Brewer is ready, it is understood, to carry out the terms of the Act passed at the last session of the Legislature authorizing the Government to supply the plants in question with the magnetite ore necessary to establish the practicability of producing in this country high-class pig iron at a reasonable cost. It is believed, however, that he now is met with the fact that the smelters are not in shape to handle the ore, and shipment is deferred until they are prepared to proceed with the work.

W. D. Fleet's Electric Furnace.

In the meantime the Government has been approached by Messrs. William Fraser, manager, and W. D. Fleet, electrical engineer, who are associated with the Magnetite Iron & Steel Company, with an interesting proposition. Mr. Fleet claimes to have perfected an electric furnace capable of producing pig iron from magnetite ores at a cost materially lower than is possible by existing methods. He has entered into an agreement with the Vancouver Company whereby the latter controls his process. The company already has an electrical smelter at Potlatch Creek, near Vancouver City, in which, together with outside equipment, there is said to have been invested some $40,000. Messrs. Fraser and Fleet explained this situation recently to Hon. John Oliver, Premier, and Hon. Wm. Sloan, Minister of Mines, as well as to other members of the Government, and asked for financial aid in carrying the work on which they are launched, to a conclusion. Mr. Fleet stated that before coming to British Columbia he was connected with the Canadian Copper Company at Copper Cliff, Ont., and that his experiments had proved that it was possible to produce pig iron at a cost of $13.55 a ton, with an assurance of a reduction to at least $11 a ton by the use of a larger unit.

After consideration of these and other representations the Government decided that it could not do more at the present time than to extend some small assistance towards the demonstration of the process. Accordingly it was later announced that $2,000 would be advanced the Vancouver Magnetite Iron & Steel Company to aid in proving the practicability of the Fleet Process as applied to the magnetite ores of the Province. With this sum and what will be privately subscribed it is proposed to proceed with the experiment on a small scale, and Mr. Fleet, who states that this can be done in the course of a month or two, is confident that he will be able to satisfy the authorities.

It is appreciated, of course, that, if a high quality pig can be produced here at the figure given, which is materially lower than is estimated by Dr. Alfred Stansfield in his report on the feasibility of electric smelting of British Columbia iron ores, it will mean much to the mining industry of the northwest. In fact it is felt that the practical demonstration of the verity of Mr. Fleet's contentions would result in the early establishment of the iron and steel industry on a considerable scale.

The Port Moody Steel Mill.

With further reference to the local manufacture of steel, interesting evidence was given recently by G. P. Grant, manager of the Port Moody Steel Mills, before a Royal Commission appointed to investigate the condition of enforced idleness at Vancouver shipyards owing, it is stated, to lack of necessary construction material. Mr. Grant said that he did not consider his company was getting enough orders from the Dominion Government in view of the fact that his was a B.C. firm making B.C. steel. He asserted that his plant was in a position to handle larger orders. There was a twenty-one inch mill lying at the plant unassembled because there was not enough work to warrant its being installed. It could be put in working order in two months. Explaining the system used by his firm for making steel by electric smelting, Mr. Grant said that they used scrap, large quantities of which was supplied by the shipyards. The scrap was all put in the furnace, and refined, and the angles used by the shipbuilders were all made under the supervision of Lloyd's inspector, who passed the material before it left the plant. His firm had no trouble in getting the material without going to the United States or to Eastern Canada and had little or no trouble in operation. "We have been running," he stated, "twenty-four hours steadily with only four hours shut-down and only three or four reject heats."

TRAIL SMELTER NOT TO BE CLOSED.

The Consolidated Mining & Smelting Company, which operates the Trail Smelter, asked 75 men from its Rossland mines, on account of the good progress on development work there, to go to the company's Sullivan Mine at Kimberley, the most important zinc and lead producing mine in Canada.

This apparently gave rise to a rumor that the Trail smelter had closed. There was no foundation for the story as the company is operating the plant as usual.

TO DEVELOP THE YUKON.

The Yukon Development League is asking the Federal Government for a grant of $100,000, to assist in the development of lode mining. The League suggests the Government send a mining engineer to the Yukon with authority to spend the appropriation on the properties that, in his judgment, are most promising, provision being made to secure the advance by first liens on the properties on which it is spent.

The League is also asking that a railway survey be made from Hazelton or some point on the Grand Trunk Pacific Railway in British Columbia, and Dawson, with the idea of constructing a railway to Dawson at an early date.

The League wishes to have telegraphic communication opened between Eagle, Alaska, and Minto Bridge, near Mayo Landing, on Stewart River. Eagle is connected with Dawson by telegraph.

Dr. Alfred Thompson, the member of Parliament for the Yukon, is now busy on these matters in Ottawa.

Special Correspondence

BRITISH COLUMBIA.

Smelter Charges.

The report of the special committee which has been investigating the smelter charges of the Consolidated Mining & Smelting Company at Trail, B.C., will be forwarded to the Minister of Mines, Ottawa, at an early date. Its findings are awaited by the operators of the Kootenay and the Boundary Districts of the Province with interest. The personnel of the committee is S. S. Fowler, chairman; and Ivan deLashmutt and James Anderson.

President W. H. Nichols Visits Granby Properties.

Dr. W. H. Nichols, President of the Granby Consolidated Mining & Smelting Co., the greatest copper producing concern of the Pacific Northwest, made a tour of British Columbia during the month of May. His object, primarily, was to inspect the properties of the Granby Company. Accompanied by the company's General Manager, F. M. Sylvester, he visited the new colliery at Cassidy's, Vancouver Island, which has been producing some 2,500 tons of coal a month since shipment was commenced, and the equipment of which is reputed to be the most modern and the finest in every respect in the Province. The plant, of course, is capable of handling a much greater output, in fact, it can scarcely be said to have commenced operation in earnest as yet, such development being deferred until the company is prepared to handle the coal at its new by-product coking ovens, which are situated at Anyox, B.C. From this point Dr. Nichols and party proceeded to Anyox, the company's copper producing centre, where is situated its smelter, and near which are its largest mines. This was Dr. Nichols' first trip to Anyox, and he was much interested.

In interviews given in the course of his tour Dr. Nichols said. "If our country was neutral, there was never a day's neutrality with us." Speaking of the production of chemicals during the war, he said, as Chairman of the Advisory Board on Gas Warfare for the United States, that it was the work of the Board to "go the enemy one better" in the manufacture of gases for offensive purposes. In one plant alone 100 tons of mustard gas was being produced daily when the war ended. Had the war not ended when it did a gas attack would have been made on the enemy from Belgium to Switzerland. The production of acids for explosives also had exceeded the best expectations of the United States Government.

Dr. Nichols said that he was now giving attention to industrial development, especially on the Pacific Coast. He was much interested in the Granby properties, naturally, but, as well, found food for thought in contemplation of the natural resources of the western country. The immense wealth of timber possessed by the Pacific Northwest led to the belief that the manufacture of paper was destined to become a leading industry. Chemists would find a means of making the timber now wasted available for the production of paper.

The development of a steel industry, too, he thought quite feasible. With the abundant deposits of magnetite ore said to exist, together with the enormous electrical energy which could be developed from the many great natural water powers, he considered that the electrical development of iron ore bodies was a project of great promise.

The Ore Testing Mill.

The suggestion that the ore testing mill which the Dominion Government proposes installing in British Columba, should be placed on the Coast is vigorously combatted by the mining men of the Provincial Interior. F. A. Starkey, secretary and manager of the Nelson, Slocan and Eastern British Columbia Mining Association, has addressed a protest to Hon. Martin Burrell, Minister of Mines, Ottawa, in which he comprehensively enumerates the claims to the proposed plant of that section of the Province represented by the Association. He says in part: "It is true there are complex ores at the Coast, but they are chiefly copper and iron, which generally require smelter treatment only. Bodies in the North are developed to but a small extent. The interior, on the other hand, has complex ores of all varieties, and has developed them to such an extent that if the problem of treatment were solved they would immediately produce tonnage. There may be some misapprehension as to what constitutes a testing plant, and what its functions are. Whatever the idea of the Government and its officials may be as regards what is necessary, and what will be of lasting benefit to the mining industry, we do know what the people and the miners of British Columbia want, and that they insist and will have. As their views may not previously have been placed before you for your consideration, it may be well to re-state them very briefly.

"You are no doubt aware that there are vast unworked mineral deposits in British Columbia. In addition to gold the principal resources are complex ores of silver, lead and zinc. Unless there contain a large amount of silver it is impossible to find a market for them in the condition in which they come from the mines, unless they first undergo the process of concentration to separate the lead contents from the zinc. If ordinary simple concentration is adopted by the miner, not more than half of the zinc with its proportion of silver is ordinarily recovered. Even if the smaller miner could afford to erect a concentrating plant, the results are generally of too wasteful a nature to be profitable.

"It is therefore necessary to apply flotation and magnetic separation for the saving of metal values. The ordinary miner has neither the means nor the knowledge to apply this process, for the first essential in a flotation process is to determine what modifications are necessary for his particular ore, and which means all the difference between success and failure. For this purpose very highly skilled and costly experts having a wide experience of every kind of ore are necessary.

"As an instance of this I may state that the Standard Silver Lead Mining Co. only adopted flotation in the year 1916, for previous to that time the highly paid experts employed by them were unable to obtain favorable results. Since that time great progress has been made in the art, but it is not anticipated that we will ever be able to dispense with the services of experts to determine the best procedure in each individual case.

"If a central testing plant were established at a

convenient point the expert in charge would be in a position to definitely determine the best process for each ore, and so encourage the miner to lay out capital on his concentrating plant without the fear of losing his money, which has so often happened in the past.

"It is further our opinion that quite apart from the direct value of a Government plant for this purpose a modern concentrating plant would pay a good profit by the impost of a small charge for custom ores.

"If I may remind you the idea of such plants originated in this district, for an organized attempt was made to interest both Federal and Provincial officials in its advantages to the whole country. The proposal was that small but efficiently equipped government concentrating plants should be located in positions that each would serve about half a dozen small mines. These small mines could be operated if concentrating plants were available to make a marketable concentrate, and would contribute largely to the mineral output instead of being shut down as they must be until concentrating facilities are obtained."

The Lockwood-Dalziel Process.

Mining men have been watching with interest the demonstration in Vancouver, B.C., of the Lockwood-Dalziel Copper Recovery Process which appears to be giving satisfactory results. Those who stand sponsor for the process make four claims for it as against the present standard methods of copper reduction, viz.:

(1) A greater percentage of the copper contents of the ore is extracted—the method increasing recovery from five per cent to twenty-five per cent over standard methods.

(2) A saving in operating expenses of from two cents to five cents on each pound of copper produced.

(3) A reduction of from twenty per cent to forty per cent in cost of plant and equipment.

(4) Only ten per cent to twenty per cent as much water required as in other concentrating or leaching methods.

It is said by practical mining men with technical qualification that there is no doubt that apparently satisfactory results are obtained insofar as the separation and recovery of copper is concerned. Which is the most expensive?—rosting, leaching and depositing the copper by electricity as is done by the new process or the direct smelting of the concentrates after paying transportation charges on the latter from the mills. While the efficiency of the method appears to be admitted, there is no certainty on the latter point, although it is not at all improbable that the process will be given a practical economic test in connection with some one of the copper properties which now are in course of development.

Lucky Jim Mines.

The new Board of Directors of the Lucky Jim Zinc Mines, Ltd., is composed of Dr. H. C. Lambach, Spokane, President; George T. Edmiston, Spokane, secretary-treasurer; A. W. Allen, assistant secretary-treasurer; J. J. Collison, Victoria; Charles McKinnis, Charles Ehrenberg and Dr. T. A. Russell, Spokane, directors.

Tramway Installed at Wonderful Mine.

The tramway installed in connection with the Wonderful mine, situated near Sandon, B.C., is complete. It is about half a mile in length and has one span over a thousand feet in length without a tower, one of the longest spans of the Ainsworth-Slocan District.

Tramway from Sovereign Mine to Sandon.

Construction of a tramway from the Sovereign mine to Sandon, B.C., is in progress, the work being in charge of Irwin White. The Sovereign is one of the Cunningham properties and its ore will be treated at the Alamo concentrator. The Alamo mill it is reported to be almost ready for operation. The completion of the pockets and the elevating plant for the handling of ores from the Sovereign and Wonderful mines will put the concentrator in shape for work.

Portland Canal.

Portland Canal is attracting much attention and in this conection the recent announcement that the Big Missouri Group has been transferred by Sir Donald Mann to the Pacific Coast Exploration Company, Ltd., is interesting. William Noble, who is to have charge of the development of this property this summer, has gone in and proposes putting men to work immediately.

Will Develop Babine-Bonanza Property.

Further development of the Babine-Bonanza and the Emerald Group of Claims is proposed by James Cronin, the well-known mining operator of Spokane, Wn., this summer. He already is in the North to make arrangements for the commencement of work as soon as the season opens. On the Bonanza he intends to proceed with the driving of a tunnel to tap the main vein and incidentally to uncover a few other showings. Last fall a contract was awarded for this work and a good start was made before the snow flew so that everything is in readiness for resumption. The Emerald Group is not as far advanced, being as yet a prospect, comparatively speaking. Mr. Cronin has confidence in it and intends giving the work of developing it his personal attention. He states that there is every reason to believe that it will be proved a rich property as soon as the work decided upon is completed.

J. D. Galloway, mining engineer, reported on the Bonanza in 1917. He said that the development since 1909 had been corried on continuously, some work being done each summer and during several winters, a small crew of men being kept at work. Up to that time about $60,000 had been expended. All the work had been done by hand and had been expensive owing to the difficulty of getting in supplies. The total footage of shafts and tunnels at that time amounted to about 2,500 feet. As to the ore bodies, Mr. Galloway stated that they were of two types, viz.: Fissure-veins in rhyolite; and (2) contact replacement bodies lying between rhyolite and schistose argilite. "In both of these types," he continues, "galena carrying good silver values is the most important ore mineral."

California Mining Co. Will Develop Claims on Bird Creek.

The California Mining Company, with which are associated J. R. Cassin, of Spokane, Wn., president; W. R. Orndorff, of Spokane, Wn., secretary-treasurer; and W. H. Turner, manager, has obtained control of five mineral claims situated on Bird Creek, near Nelson, B.C., and proposes placing the property on a producing basis without loss of time. The development to date consists of two adit tunnels, the lower of No. 3 being in 1,200 feet, No. 2, 170 feet vertically above No. 3 is in 627 feet and ore from No. 1 is stoped to the surface. The vein is reported to be strong and well defined, and development has shown ore for a considerable distance in Nos. 2 and 3 tunnels which will average $17 a ton in gold. The Athabasca Mill has been leased for the purpose of handling the output.

SATISFACTORY PROCESS EVOLVED FOR TREATING SULLIVAN MINE ORES.

The presence in British Columbia of E. W. Beatty, the newly elected president of the Canadian Pacific Railway, who has been making his first transcontinental tour of inspection, was made the occasion of a formal announcement by J. J. Warren, general manager of the Canadian Consolidated Mining & Smelting Company, that the problem of the treatment of the complex silver-lead-zinc ores of the Sullivan mine at Kimberley, B.C., has been solved by S. G. Blaylock and his metallurgical staff of the Trail Smeltery.

This statement was made in the course of an address delivered after a banquet tendered Mr. Beatty and D. C. Coleman, vice-president of the C.P.R., at Nelson, B.C., by the Associated Boards of Trade of Eastern British Columbia. It is understood that Mr. Warren's announcement means that the metallurgists at Trail have been successful in evolving a method of treatment which will recover the silver, lead and zinc of the Sullivan mine ore, the importance of which will be better appreciated when it is understood that this mine has exceedingly large reserves and at present is the greatest producer of any property shipping to the Trail plant Mr. Warren also asserted that he believed that the problem of the treatment of the low grade gold-copper ores of the Rossland mines had been solved and that within a short time the Rossland properties of the company would be turning out between 2,000 and 5,000 tons of ore daily. High costs of production, and the fact that the price of gold has not risen to meet it, forced the company to reduce its operations at Rossland to a minimum. Since then it has been developing ore for shipment and working steadily on the problem of discovering a method by which the ore can be more profitably treated.

Prospecting is Necessary.

The mining industry was briefly referred to by S. S. Fowler, of Riondel, B.C., in a brief speech which he directed chiefly to the President of the C.P.R. He said that the Province was credited with having produced $350,000,000 worth of minerals other than gold, but the important thing was the development of the mines in the future. The greatest duty of the mining community today was to encourage prospecting. Either the old-times must be brought back or a new class of prospectors developed. "If new ore bodies are not located the District is bound to go back," said Mr. Fowler, who went on to assert that there was no doubt that there was much valuable mineral to be found and developed.

Smelter Charges.

Mr. Warren, who was called on a little later, opened by some complimentary references to Mr. Beatty, and then declared that he felt that he was under suspended sentence when it came to speaking of the Trail smeltery. At best he was "only an executive," but he was blamed when the price of copper went up and when it came down; in fact he seemed to be blamed for a little of everything.

Speaking of the future, he said that he would try to adopt a policy which would make for the development of the province. The smelter endeavored to make its charges fair, but not to give something for nothing. He did not think that would be good for the country, but he would give and do what he considered to be right.

Referring to Schedule B (which is the schedule of custom ore treatment charges of which there has been considerable criticism), he said that it was intended to be a basis for reasonable charges for the work done by the smelter. He was waiting the decision of the special committee which had the schedule under consideration, with a feeling that all should get together with a view to the development of the country. The smelter had been criticised for treating the ore from the Sullivan mine on a lower schedule than that charges for outside word, but it was forgotten by those responsible that it would be impossible for the smelter to operate without the Sullivan ore.

War Service.

The speaker told of the special operations carried on by the smelter to assist the Allies win the war. The company has saved the British Government over $6,000,000 on the cost of its zinc alone. In this statement Mr. Warren referred to the installation of Trail of an electrolytical plant for the recovery of zinc, the initial cost of which is understood to have been about $1,000,000 and which was responsible for turning out large quantities of the metal during the latter years of the great war.

Mr. Warren said he would like to see more co-operation with regard to the development of the Canadian market. Illustrating his point, the speaker told of observations made during a trip to Washington after the United States had entered the war. Mr. Warren had offered to sell lead at about two cents under the price which the American producers were receiving, and as a result was nearly driven out of the city. Recently in Canada the Canadian National Railways sent to Mexico to purchase lead when the smelters had several thousand tons on hand. He said that that sort of thing should be stopped.

Decreasing the Cost of Treatment.

He looked to the future optimistically, however. "We will soon be in a position," he continued, " to treat from 2,000 to 5,000 tons of Sullivan ores every day. S. G. Blaylock and his staff of metallurgists have solved the problem of treating the Sullivan ores at a reasonable price. They also have discovered a new low cost process for the treatment of the low grade Rossland ores. The research department at the smelter is working hard attempting to find ways to reduce the cost of the treatment of British Columbia ores generally and we will reduce Schedule B as soon as possible."

Mining and the C. P. R.

Mr. Beatty has given considerable attention during his tour of this Province to the mining and associated industries. He has visited the Rossland Mines and the Trail Smelter as well as the West Kootenay Power Company's plant. He also spent a short time at Nanaimo, the coal producing centre of Vancouver Island. Incidentally it may be mentioned that the announcement was made recently that the C.P.R. would proceed with the construction of an extension of the Esquimalt & Nanaimo Ry. from Alberni, the present Island West Coast Terminal of the line, to Great Central Lake. It is possible that this will lead to the development of the Big Interior and Ptarmigan Groups of Claims. They are both low grade copper propositions but, as far as development has gone, show immense deposits, the working of which is held back only by lack of transportation facilities.

THE DOLLY VARDEN MINE.

The position in regard to ownership and operation of the Dolly Varden Mine and its equipment, including the 18 miles of railway from tidewater at Alice Arm to the Mine, has developed in complicity during the past two weeks. Hon. John Oliver, Premier of British Columbia, has been officially notified by the Canadian Government, Ottawa, that it has received an appeal from the Dolly Varden Mining Company for the repeal of the Provincial Legislation under which the Taylor Engineering Company obtains authority to take possession of the property and operate it for the purpose of paying the claims of $462,000, which the Engineering Company has against the Mining Company, and the justice of which has been upheld by the Legislature. Premier Oliver interprets the notification as merely the extension of usual formal courtesies between the Federal and Provincial Governments. If, however, it means that the Province is expected to enter a defence of its legislation it is another matter, and it is hardly likely that the British Columbia Government will do so. Its position is that the legislation is within its jurisdiction, having to do only with civil and property rights, which are laid down by the British North America Act, as being within provincial purview. Disallowance by the Dominion Government, therefore, would precipitate a more or less bitter struggle and lead to exceedingly strained relations between the two administrations.

Meanwhile the Taylor Engineering Company is proceeding to take over the mine, etc., arrangements being under way for placing the property on a shipping basis, and for the operation of the railway over which the ore, of which a considerable tonnage has been proved by diamond drilling and otherwise, will be transported to the sea. Nor has the matter of water transportation been overlooked.

A new power freighter is being put in commission to carry supplies to Alice Arm. She has a 300-ton deadweight cargo capacity, and will be ready to start on the northern run shortly.

A. J. Taylor, president of the Engineering Concern, states that his plans are all made, that the mine will be re-opened without loss of time, that the railway will be operated, and that it will not be long before ore is shipped. He is confident that it will not be long before returns are received which will permit the payment of wages to those workmen who were employed on the construction of the railroad, and whose claims must, under the legislation referred to, be given first consideration.

Waiting for Concentrator for Rossland Ores.

Alarming reports were circulated recently to the effect that the Rossland mines of the Canadian Consolidated Mining & Smelting Company, as well as the Trail Smeltery, were being closed down. It is true that a considerable body of miners and workmen were released from Rossland, but the statement that it is proposed to cease operations entirely either at the mines mentioned or at Trail is emphatically denied by J. J. Warren, general manager of the company. In a statement explanatory of the situation Mr. Warren said: "We have been obliged temporarily to suspend shipments of ore from the Rossland mines because we have found it impossible to make ends meet with the prevailing high costs of both labor and material. We expect to resume, however, before the end of June, when the concentrating mill probably will be ready for operation. To continue in the meantime would not only result in financial loss, but in the serious wasting of our substance—in other words our ore reserves—of which there is only one crop. We are still keeping over 100 men at work in the Rossland mines. The resumption of Rossland ore shipments may be affected by the action of the Crow's Nest Coal Miners in deciding to go on strike, thus shutting off our coke supply, as the Rossland ores require a large quantity of coke for reduction.

Pennsylvania coke is now selling at very little above pre-war prices, while Crow's Nest coke commands $7.71 a ton f.o.b. ovens as against $4.50 a ton f.o.b. ovens before the war. We expect to be able to maintain our smelting operations, which have been continuous for over twenty years, excepting the short periods when our men or the coal miners took a holiday. It would be idle to pretend, though, that we are not passing through a very critical period. There has been, however, some little improvement in the lead situation—not so much in price as in there being a little better demand for the metal. Mexican lead is our chief difficulty. It was offered recently at less than 4c a pound f.o.b. Montreal in bond. We appreciate the co-operation of our men at this trying time, which cannot last for ever.

Outside reports, unauthoritative in character, are to the effect that the number of men let out at Rossland is considerable, and that, for the most part, they are men who have given expression of their support of the "One Big Union" idea. It also is stated that some 75 workmen have been discharged at the Trail Smelter. Mr. Warren, however, is credited with the statement that those who have been so released need not go idle, there being plenty of employment available for them at the Sullivan Mine, which is being developed on a large scale, and from which shipments of ore are to be increased.

The Rock Candy Mine.

The development of the fluorspar property, known as the Rock Candy, and situated near Grand Fork, B.C., by the Canadian Consolidated Mining & Smelting Company, is being vigorously prosecuted. J. J. Warren, general manager; M. A. Archibald, consulting mining engineer, and other officials of the company, recently inspected this property. After looking over the mining operations, they visited Lynch Creek, when the concentrating mill, newly installed, was in operation for the first time. The tramline, which will carry ore from the mine to the mill, also was demonstrated. The bunkers at the mill already are filled. The plant and the general equipment functioned satisfactorily, and everything is ready for work. The spur connecting the Kettle Valley Ry. with the concentrating mill is not yet quite completed, but the steel is on the ground, and will be laid without loss of time. As soon as this detail has been attended to operations will start and be carried on continuously.

BRITISH COLUMBIA

The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, $75,116,103; Lode Gold, $93,717,974; Silver, $43,623,761; Lead, $39,366,144; Copper, $130,597,620; Other Metals (Zinc, Iron, etc.), $10,933,466; Coal and Coke, $174,313,658; Building Stone, Brick, Cement, etc., $27,902,381; making its Mineral Production to the end of 1917 show an

Aggregate Value of $595,571,107

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1895, inclusive. $94,547,241; for five years, 1896-1900, $57,605,967; for five years, 1901-1905, $96,509,968; for five years, 1906-1910, $125,534,474; for five years, 1911-1915, $142,072,603; for the year 1916, $42,290,462; for the year 1917, $37,010,392.

Production During last ten years, $296,044,925

Lode-mining has only been in progress for about twenty years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full information, together with Mining Reports and Maps, may be obtained gratis by addressing

THE HON. THE MINISTER OF MINES
VICTORIA, British Columbia

Complete Tie-up in Crowsnest Section.

With reference to the strike of coal miners in District 18, U.M.W. of A. (Eastern B. C. and the Province of Alberta), the situation has developed since my last letter into a complete tie-up in the Crowsnest Pass Section. The mines are being kept clear of water only by the efforts of the superintendent and a few officials. The City of Fernie, which is dependent on the colliery power plant for its light, is in darkness. The output of coal, of coarse, has ceased, and the production of coke, as a consequence, also has stopped. The latter is likely to have a very serious effect industrially if it continues. The Trail smelter is very largely dependent on the Crowsnest for its coke. Recently a considerable body of men was discharged from the Rossland mines, which are operated by the Consolidated Mining & Smelting Company, and Mr. J. J. Warren, the company's manager, made the statement that the resumption of operations might depend on the action of the coal miners, as without coke the ore of Rossland could not be treated.

In Alberta the position is much the same generally speaking. From Lethbridge comes the report that the mine workers as a body are practically without funds. Before the strike there was about $10,000 in the union's treasury. Therefore, if the strike is continued, the suffering in labor's ranks will be severe. The Lethbridge City Mine is being operated because the Great War Veterans who are helping to man the mine insist that public utilities be maintained. Lethbridge City Power House, therefore, is supplied with fuel.

From Drumheller, Alberta, word is received that, although the strike of coal miners is general in the valley, the Rosedale mine, which is operated by Mr. Frank Moodie, has resumed work with a full crew of men. It is stated there that, while foreign workers are fairly well supplied with savings to continue the strike, the English speaking miners, who spend more money, will shortly be without resources. The strikers are still trying to persuade the engineers to join them so that the mines may be flooded and made inoperative for three or four months. The latter, however, evince a determination to work.

FIRE BOSSES ON DUTY AT FERNIE.

In Fernie District the fire bosses, on a strike vote being taken, decided to remain on duty as in the past to carry out inspection duties and guard against irrecoverable damage within the mines. They state the mine management requested them to do work which, in their opinion, carried them outside their duties, and they refused, whereupon their resignations were demanded. With two reported exceptions not a wheel is being turned at Coal Creek. The exceptions are the pumps in B. North Mine, which mine would become inundated within a period of 48 hours if they were suspended, and the fans in B. North and No. 3 Mines, their gaseous nature of these collieries making it imperative to continue the operation of the ventilating systems. Caring for and feeding of the mine horses and other absolutely necessary work is being carried on by the pit bosses, and clerical and official help still on duty. As near as can be estimated there are between 700 and 800 employees directly affected at Coal Creek; at Michel about 500, and at Corbin less than 100

Settlers' Rights.

A largely attended meeting was held recently at Nanaimo, B.C., to protest against the action of the Lieut. Governor in withholding his assent to the legislation passed by the Provincial Legislature in 1918, giving settlers within the E. & N. Ry. Belt an opportunity to claim the coal rights on their property. Addresses were delivered by Hon. Wm. Sloan, Minister of Mines, J. H. Hawthornthwaite, M.P.P., and Harvey Murphy, the latter being president of the Nanaimo Board of Trade. The former went fully into the history of the settlers' struggle for the coal on their property, and argued that they were asking no more than justice, which should be accorded. Messrs. Hawthornthwaite and Murphy encouraged the claimants to persevere, assuring them that, with right on their side, they would be successful. The following resolution was enthusiastically carried:

"That this meeting emphatically protests against the action of the Lieutenant-Governor in refusing his assent to the Settlers' Rights Bill, and demands that consideration of assent be given forthwith.

"And be it further resolved that this meeting protest against any invasion of recognized provincial rights."

Reserve Mine Closed.

The Reserve Mine, Canadian Western Fuel Company, which is situated near Nanaimo, B.C., has been closed indefinitely. Thus some 200 underground workers and 60 or 70 surface workers are out of employment. The output of the Reserve Mine has been maintained for years at about 10,000 or 11,000 tons of coal a month. The Canadian Western Fuel Company now is operating No. 1 Mine, Nanaimo, with a production of about 30,000 tons of coal a month, and the Harewood Mine, which has been producing in the neighborhood of 22,000 tons a month. The Wakesiah Mine, also near Nanaimo, is still in the development stage.

INCREASED DEMAND FOR GOLD AND SILVER.

The war caused a universal absorption of the available gold supply for credit purposes. It went mostly into the great state banks of issues and national treasuries of the world. It came mostly out of circulation. The vacuum so created, and more, was filled by paper emissions, of more or less doubtful redeemability.

But the world cannot remain satisfied to have billions upon billions of paper circulating as money. The world's bank deposits doubled during the war, going from $25,000,000,000 to $50,000,000,000. It is estimated that note currency increased $100,000,000. In Germany alone there is $7,000,000,000 of new bank notes brought into being on account of the war.

Hence, there will be an increased demand for metallic money, gold and silver, for years to come to supplant, in a measure, this paper circulation. Gold and silver mining will be an economic urgency

But the production of gold has certain limitations. It is only found in paying quantities in certain quarters of the globe. And its price is fixed according to the monetary standard.

It is silver, therefore, that will be relied upon to a great extent, to fill the necessities of coinage. Here there can be extended a premium to encourage production. The United States government has done so by establishing a minimum price of $1 an ounce for silver for an indefinite period.

Over the period of the war the total stock of gold money in the world increased about $1,575,000,000. But in that period the stock of gold in the state banks and treasuries of the world increased approximately $3,125,000,000, or nearly twice as much. The difference is the result of that striking development of the war, namely, the withdrawal of gold from circulation and its concentration under the control of government institutions. The money came partly out of the private banks, but mainly out of the pockets of the people. These figures are based upon returns of the world's output, with due allowance for the gold absorbed in the industries and by India and Egypt.

Gold Circulation $1,500,000,000 Smaller.

Thus, the world's gold circulation, in spite of the increase in the general supply, is to-day smaller by over $1,500,000,000 than it was before the war.

At the end of 1913, 63 per cent of the total stock of gold money was in state banks and treasuries and 37 per cent in the hands of private banks, and the public. On June 30, 1918, the proportions were 85 per cent and 15 per cent respectively.

The proportion in the hands of the public, apart from private banks, before the war, was estimated by the Manchester Guardian of England to have been probably about 30 per cent, mainly in France, Germany, United States, United Kingdom and Russia; while to-day it must be far smaller than the 15 per cent mentioned above. "It may be," said this authority, "that for some years to come gold will not be allowed to circulate freely in European countries for internal purposes, for the amount of gold required by the central banks as a basis of their note circulation and the structure of credit it will have to support will be very great."

It is to be noted along this line that the British currency report issued late last year recommended against complete return to the internal circulation of gold coin that obtained in England before the war.

Before the war the United States held about 25 per cent of the world's stock of gold. To-day it holds 33 per cent.—Boston News Bureau.

An article on the "Efficient Compression of Air' in "Mining & Scientific Press," suggests for the purpose of detecting leaks in compressed-air transmission lines the practice of an Illinois man "who, at regular intervals, puts essence of "peppermint into the air system, and then has all the pipes "inspected. Leaks are revealed by the odor." We can imagine some entertaining possibilities if this method were tried in some collieries our readers know of.

The Technical Supplement to the review of the foreign press, which is issued fortnightly by the British War Office, reproduces a report from the Austrian Chemical Journal that the Hungarian Department of Agriculture has decided to transform the Magyarovar Explosives Works into a factory for the manufacture of artificial manures. The note is headed "From Explosives to Manures." Without desiring to accuse the War Office of levity, is this heading a gentle hint of the modern expression of the ancient formula "swords to ploughshares and spears to pruning hooks"?

THE OIL CONCESSION CORRESPONDENCE.

On April 25th a complete return of the correspondence, telegrams and other documents in connection with the application of the Shell Transport and Trading Company for the grant of certain oil lands was made by the Department of the Interior. Several articles have appeared in this journal during the past winter concerning the proposed concessions. We did not at the time have copies of the correspondence, and we are reproducing parts of it in our next issue for those of our readers who are interested in the matter. It will be noted that the original proposal was definitely turned down by the Department of the Interior in January, 1918. There were subsequent proposals, however, and the memorandum of the interview granted by Hon. Arthur Meighen to Sir Reginald MacLeod and Mr. H. N. Benjamin on July 13th, 1918, is especially interesting. The proposal of these gentlemen was finally turned down in March, 1919.

We have little doubt that most of our readers will commend the decision of the Department of the Interior with reference to these applications. Those who wish to develop oil fields in Western Canada, whether they be big companies or little fellows, should be governed by the mining regulations. There should be no special favors for the corporations that have great financial resources. They can enter the field on the same basis as the pioneers in the Western oil fields, and their financial ability to do things on a large scale should not frighten them out of the field, unless they fear that their exploration ability is not on a par with that of the men who are already in the field.

It will be a good thing for the Northwest if exploration work, such as proposed by the Shell Transport and Trading Company is carried on in the near future. We would be pleased to see this company go into the field and carry on the search for oil in a big way; but under the same conditions as others who have been searching for oil in Western Canada while this company has been seeking concessions.

We are willing to admit that any company would be pleased to have such concessions and we are not surprised that one company should ask for them. Their failure to secure concessions is not blameworthy. The government's failure to refuse them would have been.

Compliance might have brought about development more quickly than we will now have it, and the lost time is something that we regret; but we are very well satisfied that the people of Canada will prefer the loss of time to the loss of their oil rights, and that they would prefer to have a number of smaller companies exploring under the mining regulations rather than one big company operating under special privileges and controlled abroad. The Shell Company can now come into the country on the same terms as the other fellows, having satisfied itself that special concessions are not obtainable. We will be ready to welcome it when it does so.

FURTHER DECREASE IN BRITISH COAL PRODUCTION ANTICIPATED FROM EFFECT OF SHORTER WORKING DAY—INCREASED COST OF COAL TO CONSUMERS.

Sir Auckland Geddes has announced in the British House of Commons that following the commencement of the shorter statutory working day which comes into operation in July, the production of coal in Britain may be expected to decline still further, accompanied by an increase in cost to the consumer of over a dollar per ton. Sir Auckland Geddes stated that as far as possible to judge "the estimated output for the twelve months from July, 1919, after the reduced hours come into force, is between 214,000,000 and 217,000,000 tons a year, compared with 287,000,000 tons in 1913. The consumption of coal for inland purposes and bunkers, which was 210,000,000 tons in 1913, had fallen to 196,000,000 tons in 1918. Exports in 1913 were 77,000,000 tons, and in 1918 were 34,000,000 tons.

In order to preserve approximately the same quantity for inland consumption and bunkers from July, 1919, all present restrictions on consumption must be fully maintained, and, in addition, exports must be reduced from 34,000,000 tons to 23,000,000. After guaranteeing profits to the owners at the rate of four-pence a ton, the estimated deficiency on the working of the industry would amout to £44,600,000. This meant an increase to the consumer of about four shillings and sixpence a ton.

The members of the coal commission were supplied to-day with a memorandum and schedules relating to the coal output. The figures had been prepared by Sir Evan Jones, the coal controller. For the first twenty weeks of 1919 the output was at the rate of 242,000,000 tons a year, compared with 287,000,000 tons in 1913. The average number of men employed during the twenty weeks was 1,111,000, ex-

actly the same number as the average for 1913. The percentage of absentees due to sickness, injury and voluntary absence increased from 10.7 in 1913 to an average of 12.5 in the first twenty weeks in 1919, and to 13 per cent. in the four weeks ended May 24 last."

In a previous statement to the House Sir Auckland forecasted some reduction of the coal supply for industrial and domestic use in Britain, or a stricter limitation on coal exports, as the output of coal per person employed continued to show a decrease without any shortening of the hours of work.

The "Iron & Coal Trades Review" states that the output per person employed in and about mines has since the commencement of the war shown a persistent reduction. In 1915 production per man was 270 tons per annum; in 1918 it was 260 tons, in 1917, 247 tons, and in 1918, 232 tons. During this same period the wages of the miners have increased by close upon 120 per cent.

The production of coal in the United Kingdom in 1913 was 287,411,869 tons, and the ordinary home consumption of coal was something like 250,000,000 tons. If, as Sir Auckland Geddes anticipates, the British coal production should fall so low as 214,000,000 tons per year, it means that Britain will not even supply her own needs, and that instead of being an exporter of coal, she must become an importer. The train of consequences of such a reversal would be so calamitous that one does not care to dwell upon them. One must trust the essential good sense of the British people to see that the axe is not laid to the root of that industry which pre-eminently has enabled Britain to be a great industrial and maritime nation.

It may be noted that the output of 1913 was secured by the labour of 1,110,884 persons, which is slightly less than the number now reported as employed at coal mines in Britain. More men on the payroll, reduced production, lessened working hours, decreased efficiency during working hours, wages more than doubled—Britain is about to pay dearly for the preferential treatment demanded by and accorded to coal-miners.

PROPOSED EXPLOSIVES TESTING STATION AT OTTAWA.

Our British Columbia correspondent writes that Mr. J. G. S. Hudson, of the resurrected Explosives Branch of the Department of Mines at Ottawa, is now conferring wtih the provincial authorities in British Columbia on the desirability of a uniform set of regulations for Canada dealing with the manufacture, sale, transportation and use of explosives, more particularly in connection with mining and quarrying operations.

We also understand that the long-deferred appropriation for the erection of an Explosives Testing Station at Ottawa, under the direction of the Mines Branch, is now to be expended. The undertaking of this work was—like many other necessary undertakings—deferred because of the greater and more immediate necessities of the War, but we venture to assert that the great expansion of mining and qaurrying during the war period, and the more self-sustaining character of the explosives industry in Canada occasioned by the restriction of the sources of supply of the raw materials used in the manufacture of explosives, has demonstrated most clearly the necessity for an explosives testing plant in Canada.

The action of the Government will be welcomed both by the manufacturers of explosives and by all mine owners who have a proper sense of the responsibility that rests upon the user of explosives, a responsibility that touches not only the safety of the workman, but the quality of the product of the mine and the pocket of the owner.

In this connection we would draw the attention of our readers to a paper read before the last meeting of the Canadian Mining Institute by Mr. H. Y. Russel, the Manager of the Technical Division of the Canadian Explosives, Ltd., in which the author remarks: "Until such time as the Dominion Government establishes a Department of Explosives with a testing station, the best a user of explosives can do towards deciding as to the safety or otherwise of an explosive is to take into consideration the standing of the company manufacturng the article.

"In England there is a list of 'Authorized Explosives," that is, explosives which are authorized by the Home Office for use in work outside of coal mines; but in Canada this procedure has not yet been followed, and the permission of the mine officials to test an explosive in any working rests mainly upon the standing and reputation of the firm of manufacturers and the persuasiveness of the company's representative."

Those provinces of Canada which are most interested in the testing of explosives are the provinces containing coal mines, where any regulations limiting the use of explosives under dangerous underground conditions have been difficult to make because no government test or regulation existed which would specify exactly what constituted a "permissible" explosive for use in coal mines. It has been necessary to use British and United States standards for this purpose, which is distinctly awkward when the explosives used are manufactured in Canada. The officials in charge of the United States Bureau of Mines have always been most courteous in allowing the use of their testing station to Canadian applicants, and the literature distributed by the Bureau concerning the composition and the use of explosives has been of great value, but we believe our readers will agree that the mining industry in Canada is large enough and sufficiently important to justify us in having our own explosives testing station, and a department of the Mines Branch especially charged

to acquire and disseminate information as to the composition and use of explosives, and their use under specified conditions in mine workings.

We believe that a significantly large number of the coal-mine explosions that have occurred in Canada originated in blasting operations, and the recent disaster at Wilkesbarre is an example of the result of laxity in the handling of explosives underground.

THE BALTIMORE EXPLOSION AT WILKES-BARRE, PA.

The "Engineering & Mining Journal," commenting on the explosion of black powder in the Baltimore Tunnel of the Delaware & Hudson Coal Company, which occurred on June 5th, regrets that "obvious carelessness in handling large quantities of men and explosives in close proximity still exists."

We are a little puzzled, however, by a reference to the impossibility of avoiding the handling of relatively large quantities of explosives in coal mining which concludes by stating that "the inert character of black blasting powder—its comparative immunity to ignition from shock—undoubtedly causes a certain amount of carelessness in handling." No explosives should be used in a coal mine that are susceptible to ignition from shock. Mine explosives should be of a character incapable of explosion without detonation by a fulminate of mercury or other form of approved detonator, and comparatively innocuous in the presence of ordinary flame. Black powder, which may be fired by a spark, is an anachronism in a coal-mine.

We remember seeing, after the Waterford Explosion in July, 1917, a can, with the lid open, full of "Excelite," over which the full blast of the explosion had passed. Beyond the grey dust deposited by the blast upon the paper cartridge-cover, the explosive was uninjured.

On another occasion a small powder-storage house was blown to pieces by an explosion of detonators, and full cartridges of explosive were scattered over the surrounding country, uninjured and intact. Most "permitted" explosives are quite safe to handle and inert except when used with a detonator, but black powder—or gunpowder—is proverbially and notoriously dangerous, and its persistent use in coal-mines is a deliberate sacrifice of safety to custom and supposed cheapness. It is curious to note that the prejudice in favour of the use of black powder is chiefly found among the miners themselves, and is based, of course, on the fact that black powder, because of its slow disruptive character, is a "good coal-getter." Where black powder is used in coal-mines, open lights are usually found, and they form an ideal combination for the promotion of inquests, especially if there should be present, as is not unusual in coal-mines, a little gas and some coal-dust.

"A TYPICAL CASE."

The following editorial from the "Daily Times" of Victoria, B.C., sums up the unsoundness of the "One Big Union" idea admirably:

"A worker in the shipyards recently purchased a home on which certain payments are due. If he is able to remain on his job a few months longer he will have no difficulty in meeting his obligations. If he must go on strike and lose his revenue he will be in danger of losing his home, especially if the strike be prolonged.

He is a good trades unionist. His relations with his employers are satisfactory, his conditions of employment having been prescribed in an agreement accepted by the employing company and representatives of his union on the basis of collective bargaining. He cannot see why he should have to quit work, break an agreement ratified in his name, lose his home and inflict privation upon his family on account of a dispute in Winnipeg. He cannot recall that workers in Winnipeg imposed these disabilities upon themselves on account of labor troubles in Victoria.

Furthermore, he cannot see how a strike in the Victoria shipyards can help matters in Winnipeg. It cannot influence the Government of Manitoba in the slightest to relax its determination to refuse to take any legislative action until the sympathetic strike in Winnipeg is first called off. The proposition may be all right for the strike officials, for their pay still goes on, but it is poor business for him because in a strike his pay must stop. And this is a typical case."

The Winnipeg strike leaders would not, however, admit the propriety of a shipyard worker owning his own home. That would make him a capitalist, and, if we understand aright the beliefs of those who preach the righteousness of the dominance of the proletariat, the ownership of a house would have the effect of changing the moral nature of such a worker.

The doctrine that all men are separated into two classes, namely, the capitalist and the laborer, is a poisonous and depressing one, and its adoption is only conceivable by those who have no hope in the world. It is more wicked than feudalism, without its chivalry, and the idea is not distinguishable from the Hindu conception of caste. Its acceptance as a principle of political administration would mean that no man could ever hope to escape from the social status of his parents, and it would rivet upon the worker chains as strong as steel and as burdensome as lead.

The division of our Canadian people into two camps, inherently and everlastingly at enmity—which is the doctrine preached at Winnipeg—is so foreign to our national ideals, so exactly the opposite of the self-reliant and ambitious characteristics of Canadian men and women, that we need not fear its spread, except and unless we allow the growth of urban conditions of congestion and poverty that rob men of hope and ambition, and provide nurseries for the spirit of revolt that sleeps, or wakes, in every man, according to his circumstances.

REPRINT OF REPORT ON THE SUBMARINE COAL FIELD OF NOVA SCOTIA BY DR. HENRY S. POOLE IN 1877.

We reproduce in full in this issue of the Journal that portion of the late Dr. H. S. Poole's report as Inspector of Mines for the Province of Nova Scotia for the year 1877, which relates to the coal content and future workability of the undersea coalfields which fringe the shores of Nova Scotia and Cape Breton Island. The report referred to was the last made by Dr. Poole in his capacity as Inspector of Mines and may be regarded as his testament concerning the submarine coal tracts. The Journal has a large and valued circle of readers in Nova Scotia, where the questions connected with the extraction of the undersea coal are attracting much interest. Copies of the Report of the Nova Scotia Department of Mines for so distant a date as 1877 are not easily obtained, and Dr. Poole's statements are so pertinent to existing conditions and show such prescience and sound judgment that in the interest of our Nova Scotian readers we have decided to make this report available for reference.

When Dr. Poole assumed a distance of three miles from shore to be the boundary of profitable working he was in advance of mining opinion in Nova Scotia, but later developments have demonstrated that the extraction of coal may be confidently anticipated at distances from shore much exceeding three miles. The furthest distance from shore at which we know of coal being extracted is at the Whitehaven Colliery, where, in workings off the shores of Cumberland, coal is being successfully won at a distance closely approaching five miles.

We hope, in future issues of the Journal, to publish a series of articles dealing with various phases of undersea mining.

DRILLING FOR OIL IN NEW BRUNSWICK.

"Moncton, N.B., June 14.—The New Brunswick Gas and Oil Fields, Ltd., in the Stoney Creek field at Well No. 18, about eight and a half miles from Moncton, in their deepening process have struck the most prolific and deepest oil sands yet found in this field, at a depth of 2,622 feet. The oil came with such a gush that it flowed intermittently to the top of the derrick, a height of seventy feet above the ground. This is the first gusher struck in this field."

It is understood by the Journal that the interests of the New Brunswick Gas and Oil Fields have been acquired by the Anglo-Persian Oil Company, and that a systematic search for oil is now being undertaken. Four drills are now operating, and a genuine attempt is to be made to prove or disprove the oil-bearing nature of this New Brunswick territory.

For a good many years the town of Moncton has been supplied with natural gas, which is used locally for both lighting and heating purposes.

Mr. Matthew Lodge, who is the moving spirit in the development of the natural resources of coal, oil and gas in the vicinity of Moncton is optimistic over the possibilities of this region, and the Journal hopes to give shortly some authentic information regarding the recent developments.

The Journal understands further that the new interests associated with these New Brunswick properties intend to develop the large deposits of oil-shales in Albert and Westmorland Counties. Recent bores have proved these shales to a greater depth than previously demonstrated.

Mr. Lodge is an "entrepreneur" of the best type, who has spent a good deal of time combatting the doings of a very undesirable type of fakir that seems to have found New Brunswick a favorable operating centre, and it is largely owing to his persistent and well-founded belief in the value of the oil bearing occurrences of New Brunswick that reputable people like the Anglo-Persian Company have become interested therein.

The high cost of coal, and its probable still higher cost, combined with its comparative scarcity throughout the whole north-eastern portion of North America, has entirely altered the relative values of coal and oil as fuels. In this connection there is also to be considered the technical advances made in the use of oil and carbonaceous shales or lean coals as fuels. — F. W. G.

ANOTHER DIVIDEND.

A dividend of 5 per cent. was recently declared by the Belmont Surf Inlet Mines, Ltd., payable July 1st.

VANCOUVER DELEGATES TO THE NELSON CONVENTION.

At a meeting of the Vancouver Board of Trade, held Tuesday, June 10th, it was decided to send three delegates to the Nelson Convention.

The Vancouver Chamber of Mines is sending two delegates whose names have not been decided upon at this writing, but who will be two representative men prominent in the industry.

JOHN L. AGNEW,
Vice-President International Nickel Co., of Canada.

The Mining Industries in British Guiana

By J. BARKLEY PERCIVAL.

During the war gold, diamonds and other precious metals and stones in the colony were officially non-existent. Now that hostilities have come to an end, and the enemy, it is to be hoped, rendered incapable of further mischief for many years to come, there is no reason for silence concerning the existence and possibilities of the rich minerals which exist in the hinterland of the colony.

The principal mining industries at present are, of course, gold, diamonds and bauxite; the latter of very recent growth, and although by now fairly extensive, yet likely in the future to assume proportions of the very first importance.

It is not definitely known when gold was first discovered in British Guiana, but the first gold expedition went up the Berbice River as long ago as 1720. More than a hundred years elapsed before any well organized attempt at mining for gold was made by a company which discovered gold-bearing quartz at Wariri on the right bank of the Cuyuni. The project had, however, to be abandoned on account of the district being in dispute between British Guiana and Venezuela. In the eighties there was a revival and by 1886 the industry was so well established in the Essequibo, Mazaruni and Cuyuni districts that the first set of mining regulations was passed in that year. Gold production continued steadily to increase, reaching its zenith in 1893-4 when 138,528 ounces was produced. At that time the gold industry was in the heyday of its prosperity, and there has been no return to the good old days since that time, the yearly production averaged about 54,000 ounces. Gold bearing quartz is to be found throughout the colony; and all the fields where mining have been carried out have proved of value, rich finds being made in each. Perhaps the most valuable field for its size was at Omai, on the left bank of the Essequibo River, from which place over 50,000 ounces alone of the precious metal, valued at one million, seven hundred and fifty thousand dollars have been obtained from an area about sixty acres. This production was arrived at by working such instruments as sluices and "long toms" which here and there took the place of a dredge or a small stamp mill. Various factors contributed to putting companies engaged in crushing operations out of business; the Peters mine, which was worked from 1905 to 1910 being the last and, having during that period secured 39,017 ounces of gold. There are also now only two companies engaged in dredging, the Guiana Gold Company on the Kenawaeuk or Conawaruk, and the Minnehaha Company on the creek of that name. From 1906 until 1916 the former company had recovered 64,200 ounces, while the latter from 1909 to 1916 had made a total output of 14.059 ounces. Since 1884, at which time gold mining started in earnest, until the end of 1917, no less than two million ounces has been won from the goldfields of British Guiana and that, it must be noted, mainly from alluvial washing only. The war naturally caused a slump in gold fields activity, owing largely to the increased cost of supplies, and partly to the fact that laborers who used in the past to leave their homes for the interior found remunerative employment on the works of construction in progress on the coastlands. The industry also suffered from another and much more serious factor in that it is the only commodity in the world which has decreased instead of increased in value as a result of the war. The cost of securing the metal has increased considerably, and while the value of gold is nominally the same, its purchasing power has been reduced by nearly half. In spite of these crushing conditions the two companies operating in the colony have been plodding steadily along, and it is to be hoped that the concessions recently made by the Government in reducing the royalty on alluvial gold from 70 to 50 cents, and making mining and dredging companies pay a five cent tax on profits in lieu of royalty, will relieve the industry of part of its handicap and encourage a future expansion of the industry.

Diamond mining has not shared the misfortunes of gold during the war; on the contrary the output is distinctly on the up-hill grade. In 1913 there were 9,078 carats exported to the value of eighty-two thousand, three hundred and fifteen dollars. A slight increase in the next year was followed by a slump in 1915, but in 1916 there was a revival and in 1917 no less than 16,985 carats, equivalent to one hundred and eighty-five thousand, seven hundred and eighty-seven dollars, were sent out of the colony. The country being so intersected by rivers, the general means of transport is by water, and the facilities are good. There is steamer communication from Georgetown, the capital of the colony to all the centres of the districts from where boats and crews can easily be obtained to cover the remainder of the journey at a reasonable cost. The journey to the diamond fields is infinitely more strenuous and hazardous than to the gold fields for instance, but with the construction of the projected roads in the interior in the region of the diamodiferous area, many of the dangers of transportation will be avoided.

By locating themselves on the banks of the Demerara river at a navigable part, bauxite deposits which are now being worked have shown themselves to be more considerate, and there are other districts in the colony in which bauxite is known or believed to occur in positions in which the deposits may be commercially worked—in the north-west district, and on parts of the Essequibo, Berbice, and Corantyn Rivers. The possibility of the occurrence of extensive deposits of bauxite of good quality, has led the British Government to order a special geological survey to be made for the purpose of ascertaining the extent of the deposits in different parts of the colony. Provided that rapid and stable communication is established with the interior, and the Government avoids obstructive regulations, sufficient is already known of the wealth of the colony's minerals to invite capital for the development of one of the richest countries in the Empire.

Northern Ontario.—A new vein has been uncovered at the old Foster property, which has been operated under lease for the past eight weeks. The vein was found on surface as a result of stripping, and shows a vein about two inches wide in which silver occurs. Further work will be necessary before determining whether or not the find is important.

Submarine Coal Workings

Extract from The Report of H. S. Poole, Inspector of Mines, Province of Nova Scotia, Year 1877.

There is a popular fallacy that our coal resources are inexhaustible; it is even sometimes asserted that our coal measures cover 18,000 square miles. When it is remembered that that number represents the full area of the Province, a statement that our workable coal fields above high water mark, do not embrace one-sixtieth of that area, will not seem so surprising, or that the figures enumerating the available contents are easy of expression. Few probably are aware how restricted is the Pictou field; so far as proved, its total output, could not do more than supply the trade of Great Britain for four years. If then, the land fields are limited, the greater is the necessity for looking after the sea areas, which sooner or later will tax engineering skill to the uttermost.

The coast sections of Cape Breton and the Gulf shore early demonstrated the probability that the existing coal measures are but remnants of immense fields that now lie submerged under the Atlantic and Gulf of St. Lawrence. Outliers of the latter yet remain at George's Bay, Newfoundland, at Chimney Corner, Broad Cove, and Port Hood on the Cape Breton Coast, at Tracadie, Cariboo and other spots on the south shore of the Straits of Northumberland. Through this field faults have brought to the surface lower carboniferous rocks at the Magdalen Islands, at Margaree Island, Smith's Island off Port Hood, and Pictou Islands. Prince Edward Island remaining as a vast tract of undenuded overlying Triassic rocks, may, as the vale of Cheshire similarly related to the coal measures, yet be pierced by coal shafts. Of the Southward and Eastern Extension of the carboniferous rocks along the foreshore of the Atlantic coast, outliers are left in Rhode Island, at Chester Bay and Lennox Passage, besides the available coal field of Cape Breton County, which remains as a considerable portion of the outcrop of what may be called the Atlantic field.

How much of these submarine fields may in time be won can at the best be only a small portion of the whole, for the major part must lie buried until time changes the relative positions of land and sea. What proportion of the submerged field will be worked can only be roughly conjectured, for so many unknown quantities enter into the calculation. The thickness and quality of the seams, the faults and troubles to be met with in the workings, the cover to be left for security, the proportion of saleable coal obtained, the increased cost, the engineering difficulties to be surmounted as depth and distance from the operating centres increase, the relative value of labor to that of the fuel produced, these and other considerations have to be better known before an approach to accuracy in any estimate can be made. But basing a calculation on our present knowledge and our prospective ability to meet the anticipated difficulties within a reasonable limit of distance and depth, some idea of the future value of our submarine coal fields may be deduced, and the necessity demonstrated for even now so conducting all inshore mining, that ultimate deep-sea mining may be safely prosecuted.

Assuming for the present a contour line three miles from shore to be the boundary of profitable working, and four thousand feet the available depth, and that no seam under three feet will be worked, then taking into consideration the minimum cover of solid measures required by our present law, the reduction to be made on account of known anticlinals, and the average thickness of the seams along their shore crops, the submarine coal field of Cape Breton, from Mira Bay to Cape Dauphin will yield 1,866,000,000 tons. This estimate assumes that after allowing one-fourteenth for unavoidable loss and waste in working, 1,400 tons may be obtained from each foot acre as was assumed in the enquiry by the Royal Commission to ascertain the quantity of coal remaining unwrought in Great Britain. It is made up by calculating separately the area of each seam in each locality, and the figures given are the sum total of all, without allowances for other circumstances than those enumerated. It does not, however, presume to be more than a mere guess at the best, but for want of fuller information is sufficient to show the approximate future value of this field. For all that is yet known, the strata may rise seaward, and distant workings be cut off, although this is not so probable, as that workings may be limited by heavy faults. But here the regularity of the measures along the shore indicates no serious dislocations. The uniform slope of the sea-bottom also negatives a probability of the foreshore being bounded by heavy faults, but rather suggests that the area above water has been reduced by long continued denudation. The seams may thin out or deteriorate, but then again some that are thin and inferior along the crop may thicken and improve in quality to the deep. The proved seams on the land have only to be followed to show how much a seam may change its character and thickness within a mile or two.

As mining must, to a large extent ever remain a matter of accumulated experience, the subjoined information respecting past, present and prospective submarine workings on the English coast is given as of great practical value for us, and as suggestive for our guidance.

Sir George Elliott, who, from a trapper boy, rose by his own ability to be a member of parliament, and one of the most wealthy commoners and extensive coal owners of England, stated before the Royal Commission, already referred to, that in estimating the quantity of available coal under the sea along the coast of the County of Durham, a distance of only 3½ miles from the shore was taken, but that "he thought it is possible that a much wider extent will ultimately be worked by sinking shafts at a distance from the shore in the sea, especially taking into consideration that this portion of the coal field includes six seams of excellent coal, with an aggregate thickness of 30 feet. This would allow of a further distance, of say seven miles being worked. The Durham submarine field within the 10 mile limit, would then yield 2,200,000,000 tons. Sir George further stated that he actually had worked 2½ miles from shaft, and that he believed at great depths it would be possible to work 5 miles from shaft with shafts 10 miles apart. Respecting barriers be-

tween separate winnings, he thought it was not of so much importance under a great depth of cover as that it should not be allowed to take away the coal up to within a certain distance of the bed of the sea. "I feel," he said, "that there should be some mode of dealing with the subject, so that parties should not be permitted to work coal under the seas, rivers and estuaries in such a manner as to ruin and destroy a whole district."

Mr. W. Y. Craig, a mining engineer of high repute, when examined "inter alia" on the system of working under the estuary of the Dee gave the following evidence:—"We commenced at first working in the hard five-quarter seam upon the long wall system, and we opened off, leaving about 20 yards of pillar above the air heading; but we were obliged to abandon it. The dip of the measures is one in five, and we found that we could not get stuff to pack the roads without bringing it a considerable distance from the gob. The expense connected with keeping up the gob roads and the packings, caused us to abandon the long wall system, and then we commenced the ten yard drift, or what is commonly called Lancashire system. From each pair of up-brows we drove headings ten yards apart, and after extending those headings from 60 yards to 80 yards on each side of the up-brows, we took back the pillars, two on each side simultaneously. By that means we were able to do without timber, and we found this system of working best suited of any which he had attempted. The roof was very stubborn, and when in long wall working it did fall, it generally fell into the face, causing a considerable loss of coal and expense in reopening. The stone drift that intersected this, and the other seam of the series under the Dee, began at a depth of 135 yards, and the least cover on these workings was 100 yards. In the next seam working on the same system, all the coal was taken below where the cover was more than 80 yards. Another seam, the Durbog, was wrought on what is called the narrow wicket system. The bords are driven 5 yards wide, and a 5 yard pillar is left. The cut-throughs are about 20 yards apart. This system of working is adopted in order to bring on the creep, so to avoid a sudden fall and fracture of the surface. After it comes on, the district is abandoned for some time to allow it to settle and then the main roads are re-opened. None of the Pillars are taken out, and about 44 per cent. of the coal is entirely lost in pillars. It was not considered safe to work nearer than within 50 yards of the surface.

In working this seam the intention was to come to long wall work when there was 100 yards of cover, and between that and 60 yards of cover to pursue the narrow wicket system, leaving 44 per cent., and not to go beyond 60 yards with any description of work whatever. In the modified long wall which was tried in the lower range, roads in the coal were kept simultaneously going, and 40 to 60 yards of face were taken away, five yards being left on each side of the road, and 20 yard pillars between each two stalls, which are worked off on coming back.

In one or two falls there was a rapid discharge of water, but it took off again. In the bed of the river, at the thinnest part, there are about 14 yards of silt, in another part it is about 40 yards. And in the bed of silt there is a strong bed of clay which is quite impervious, and had it not been for that, Mr. Craig said, he would not have recommended going so near as 60 yards.

In answer to the question:—You heard the evidence as to the desirability of leaving pillars of coal, so that in the event of the sea water coming into any of these workings, the whole coal field might not be sacrificed; do you concur in that opinion?

Mr. Craig replied:—"I think that in working under water, at such shallow depths, there is a degree of uncertainty as to what may be the effect, and in winning out new districts, it would be desirable to have it divided, and to leave barriers."

Mr. T. E. Forster, in his estimate of the quantity of coal remaining unwrought in Northumberland and Cumberland, says:— It is assumed that for a distance of eight miles on the Cumberland coast two workable seams of coal will be found under the sea, making in the aggregate 11 feet of coal over an area of 16 square miles, then taking the extent to be worked seaward 2 miles, and allowing 40 per cent to be left, the available coal will amount to 101,376,000 tons. On the Northumberland coast his estimate takes the extent to be work seaward 2 miles, and along the coast from the Tyne Northward 20 miles, and in this case allowing 25 per cent. to be left, the yield will be 403,-200,000 tons.

Mr. G. B. Forster stated that he adopted the bord and Pillar system of working at Whitehaven; that the face was 2 miles in a line at right angles to the shore and 3 miles from the pit, and about 900 feet below the ocean in that particular spot, though the seam is worked at all depths from 60 to 70 yards downwards; the seam being 10 feet in thickness. The bords are driven 6 yards wide and the pillars are left 20 yards thick. The first working takes out in the whole 36 per cent., and about 16 per cent. more is taken out when the pillars are merely cut through by 5 yards cross cuts, which is done down to a depth of 180 yards. Below that depth all the coal is taken out. At a neighboring colliery at Workington the sea broke in when the whole of the coal was being taken at a slight depth—not more than 60 yards at the most. It is supposed a gravel bed communicated with the pit to the rise, and that it was not a fair break down of the strata. At Whitehaven the sea bottom is principally rock. Mr. Forster had worked large quantities of the Hutton seam on the Tyne, under the High Main water which was tubbed off, the High Main being exhausted and full of water with a vertical pressure from 70 to 100 fathoms. He was of opinion that it was desirable to have the mines under the sea worked in compartments; certain collieries on the Northumberland coast were with that view kept distinct, and it was proposed to keep a barrier of 40 to 50 yards between each sea face.

Mr. T. L. Cottingham, when describing his system of working under the estuary of the Dee, said the shafts were sunk on the shore of the river and tunnels were driven under it to intersect and work the various seams of coal dipping under it. The coal was worked on the bord and pillar system, the pillars being on an average 20 yards wide and the bords 9 feet wide. The length of the pillars varied from 40 to 50 yards; they were cut through at intervals of 30 yards and subsequently worked back. The depth of the shafts was 166 feet from the surface, and the coal was reached under the river at that depth and worked to the rise, to within about 30 yards of the surface, and practically all was worked out. The bed of the estuary was composed of sand and a stiff red clay, in some places 15 to 16 yards thick, which it was supposed would sink or sub-

side, but would not break through; at any rate they never had the river water in upon them. Mr. J. J. Atkinson thought that 2½ to 3 miles is about the extent which it is desirable to attempt under the sea.

In the estimate of the available coal under the Firth of Forth, Mr. Geddes places it at 1,800,000,000 tons, and off the Ayrshire coast at 158,000,000 tons. Besides these submarine fields there is also a tract off the South Wales coast, which will, it is anticipated produce a large quantity of coal. Considering then the great stake England has in submarine workings, we cannot do otherwise than regard the experience and expressed opinions of mining engineers and others so largely interested themselves in the future welfare of coal mining under the sea as of the utmost utility and value for us now, when precautionary measures may be easily adopted and their provisions recognized and strictly complied with.

Desirous of benefitting by the large experience of Mr. Richard Brown, late of Sydney Mines, he was written to on this subject April 27th, 1877. In reply he stated:—"In my opinion, wherever the overlying measures are perfectly sound and impervious to water, it will be quite safe to drive passage-ways in the seam under a cover of 100 feet, and to take out 50 per cent. of the coal under a cover of 300 feet beneath the sea. When the measures consist chiefly of shale free from slips there will be no danger, but where sandstones, which are generally traversed by open joints and cracks, predominate there will be great risk of sea water finding its way into the workings, as an instance of the latter I may mention the Jacobs pit at Sydney, where, when the south levels reached within about 3 chains of the shore, there was such an influx of salt water through cracks in the sandstone roof, that we were obliged to shut off all the South side workings by strong timber dams, although the thickness of cover was 240 feet at the sea level. Again in sinking the new shafts at Lloyd's Cove a heavy feeder of salt water was met at a depth of 257 feet below the surface. Hitherto no workings have been carried on under the sea at Sydney with a less cover than 450 feet. At the Saltern pit, Whitehaven, (where I spent many a weary day years ago), the uppermost of the three seams worked was 62 fathoms below the sea at the shore, under which it dipped at the rate of 1 in 9. Near the shore 36 per cent of the coal was taken out, but as the cover increased to the dip, the pillars were split, and 28 per cent. more taken out, in all 64 per cent. Now, with a cover of 600 feet all the pillars are removed.

When the first Act relating to Mines and Minerals in this Province was framed, knowledge of the lay of the coal seams of Cape Breton was not so general as it has since become through the labors of Brown, Lesley, Lyman and others. It was then deemed sufficient to leave the definition of any desired area to the individual discretion of the applicant, and merely restrict him as to its length and contents. Consequently many areas have been taken out in irregular shapes and with but little regard for local advantages. In fact, some are perhaps more inconvenient and unsuited for economical working than others would have been, had each field been laid off in squares without at all considering the line of outcrop of the measures. For land areas the system adopted answers well enough perhaps; but now that the general course of the coal beds is approximately known, and the future value of those under the sea recognized it is most apparent that the system is not best suited for the submarine. Instead of allowing distinct individuals to take out leases of areas, one beyond the other, it would undoubtedly have been better and more conducive to the interests of the country to have restricted each lessee to a certain frontage on the adjoining coast, taking into consideration the outcrop of the seams rather than a given superficial extent.

Private individuals holding such mineral rights as those reserved by the crown, would take care as far as possible, that known facilities for access and advantageous working of the whole fields should determine the boundaries rather than haphazard selection. As the law now reads, the whole of an area can be forfeited for non-working, but not so a part that could not possibly be worked by other than a neighboring lessee; and this matter is worthy of further consideration.

It is very certain that to work sea areas to the best advantage, operators should be in the possession of the land adjoining, or that a sufficient barrier be left unworked about their pits. In either case that the approaches should not be from workings in common along the shore line, lest water breaking into one panel should get round land-wards, and destroy a whole district. Mr. Forster was of the opinion that impervious barriers should be left on the land side or sea barriers would be of no use. In this respect our present law is not very explicit, though its general bearing is in accordance with the experience cited.

In England, where the owners of small lots of land are often the owners of the subjacent minerals, thousands of acres of coal are computed by the Royal Commissioners to have been irretrievably lost on account of the awkward position of the lots, the irregularity of the holdings and the refusal of such owners to sell or lease at reasonable rates to those who, working adjacent areas, were at one time in a position to mine them profitably, but who, prevented by extortionate demands from entering on such lands, abandoned their pits. Thus the coal contained was forever lost to the country, in that the separate lots are too small to warrant the sinking of special pits for its extraction. A waste from such a source in this country was in part met by the Crown reservation in grants of land of coal and other minerals, but warning by such experience may be had, and care taken that areas are leased of such shapes as may be most thoroughly and economically worked, if only the law will permit some discretion in the leasing to be exercised.

To avoid the difficulties which experience in England showed would militate against extensive sea workings, were no safeguards to be now interposed between selfish present interests and the future welfare of the coal industry, section 42 was inserted in the Mines Regulation Chapter of the Fourth series of the Revised Statutes. Mining was already being conducted under the foreshore of Cape Breton without sufficient regard for the special requirements of the position, when the Legislature sanctioned the section in question. The section proposed to check further damage being done, and to so control incipient operations as to secure approaches to distant sections of the fields. Not that it is likely in our day that the coal lying at extreme depths and in remote districts will be required, or that colliery establishments will be in a position to work outlying sections profitably, but for the benefit of those who will come after us and who otherwise might justly reflect on our short-sighted policy and indifference to the country's future welfare. The coal required by the clause to be left in barriers may be regarded as not necessarily lost for ever, it is only reserved until

all the available coal seaward has been won, when, if it be thought expedient, specified sections of the districts now reserved may then be removed. By the Act sections of coal are not destroyed or lost, but only reserved, while were no check put upon operations, instead of small barriers of coal being locked up as it were, whole districts undoubtedly would be endangered or irretrievably lost by a short-sighted system of "developing" property. Considering the extent of Cape Breton's submarine fields, and the shallow depths of many of the seams under water, with extensive croppings of valuable beds even into the sea itself, the extra inducements to pare as close to any prescribed limit as possible with a consequent increased risk in case of infringement, make it not improbable that a greater thickness of cover than is at present stipulated for may be advisable to ensure safety. The limit assigned in the act was suggested by the practice pursued on the English coast at Whitehaven, where the overlying measures appear, by published sections, to be similar in character to those of Cape Breton. The experience under the estuary of the Dee is of less service, since on our coasts there are no such thick and impervious beds of silt to choke a crowning in should one occur That a limit of 60 yards of solid measure is excessive few will question, for the risk is so disproportionate to the gain; and as a mistake realized can never be repaired, it is better to err on the side of safety. Further experience in pillar working in existing collieries may even dictate a wider margin as advisable for security.

To enable lessees of submarine areas to gain access to their property, the statute gives them a right to drive tunnels through the measures of adjoining areas. The wording of the clause is so general, that various constructions have been put upon its meaning, no strict interpretation having yet been given. The intention of the act is obviously to prevent jealousy or conflicting interest putting obstacles in the way of working areas lying under the sea. It is no less evident that the Legislature did not intend to go beyond this, and grant facilities to the one, to the inconveniences and detriment of the other. In granting the right to tunnel through the land of an adjacent area, the statute says "doing as little damage as possible," clearly meaning thereby that if there be one means of approach, that will incommode less than another, although it may be the more expensive, that means, in preference to the cheaper, shall be adopted.

Suppose a case, where it is proposed to tunnel through an area half a mile or more seaward: To drive in the coal would be cheaper and more expeditious than to go through an equally serviceable under or overlying stratum; or again, a slope in a seam might be proposed when a vertical shaft with a tunnel across the measures, would effect the desired purpose. In the case of steep lying seams, the advantage of access in the coal, might, in some cases, far outweigh the loss that would be occasioned the proprietor of the land area, from which barriers were reserved, and therefore it might not be advisable to define the right to merely driving through coal or other workable beds, and in no case in the beds themselves. But in the first case supposed, the isolation of the approaches in the coal seam would greatly interfere with the working of the inshore area, in fact it is not difficult to foresee such a condition of affairs that would not merely interfere, but actually prevent the working of the inshore area from one set of pits, by cutting the area in two, and making the operations on either side distinct. It may fairly be presumed that the statute is not intended to incommode the prior lessee, nor to cause waste of coal already won, as an interpretation sanctioning such a practice, would necessitate. The question might also be fairly asked, whether overlying drifts within the limit of 180 feet connecting with distant abandoned or drowned out excavations, would not require workings in a subjacent seam to be protected by the thickness of barrier required for security.

When the new Chapter was added to the Statutes which relate to the working of mines, the 40th Section respecting submarine workings was incorporated as bearing on a present necessity. At the same time it was felt that possibly on more mature consideration some modification might be found advisable. The preceding remarks have been made, and authorities quoted on this subject that if possible it may receive due consideration and be fully weighed while there is time to protect the coal interests of the future from further damage, and that the public may see that the matter is not one of mere opinion on one system of working in preference to another, but is of national importance; further, it should be remembered that any restrictions now imposed can at the worst only act as a drag on the development of the coal industry, while the results of neglect or indifference, sanctioning a penny-wise system, can never be remedied.

It was, however, felt when the sub-section 40 (3) was framed and submitted without protest on the part of our mining engineers that it probably would require amendment when the coal at great depths was to be won; though it was most essential to protect the frontage and to effectually shut off deep and extensive workings seaward from such as were shallow and liable to eruptions of water. The authorities quoted believe, and the practice at Whitehaven now safely carried on indicate that there is a depth at which all fear of irruption from above may be disregarded. At Whitehaven 60 fathoms is the limit. Mr. Brown and others are quite confident that at 500 feet all the coal can be removed with impunity.

Denudation has been mentioned as the probable cause of the small present size of our coal fields, the continuing action of the sea has therefore to be considered as an element of future insecurity. According to records at different spots along the coast, the rate of denudation appears to be irregular, and the present contour of bays and headlands would lead one to the same conclusion. At several places on the Cape Breton coast the roads have had of late to be moved inland, and the old tracks are even now half or wholly obliterated by the destruction of the cliffs; eight inches to a foot a year is probably the rate at exposed places. At the Joggins, an old plan shows that the rate has been about six inches a year. A large margin in barriers has consequently to be allowed to meet this element.

PERSONAL

Mr. A. A. Hassan has been examining several prospective oil fields in Texas for the last six weeks, has decided to open an office in Fort Worth, Texas, which is the logical oil centre, for practice in geology and making examinations and reports upon prospective oil fields and to transact oil business in general. His present address is at the Westbrook Hotel, Fort Worth, Texas.

Special Correspondence

BRITISH COLUMBIA.

Dolly Varden Mining Co. Request for Disallowance Recalled.

The position of the Dolly Varden Mining Company is still occupying attention in mining circles in British Columbia. It will be recalled that notification was received by the British Columbia Government from Ottawa to the effect that a petition had been submitted there asking for the disallowance of the Provincial legislation under which the Taylor Engineering Company is taking over the proposes operating the Dolly Varden Company's property at Allice Arm. This was done, it is understood from authoritative quarters, at the instigation of George Wingfield, Reno, Nevada, in whose name there stands a mortgage against the mine amounting to $150,000. It is understood that as soon as it was realized that the property was required by the recent statutes to pass to the control and ownership of the Taylor Engineering Company in default of settlement in cash of its claims against the Mining Corporation, Mr. Wingfield took the course indicated with a view to obtaining adequate protection for his mortgage. Apparently having been satisfied in the meantime that his investment under the new conditions was in no way jeopardized, Mr. Wingfield has caused the petition for disallowance to be recalled. It therefore would appear that there is no likelihood of the Provincial Government's legislation being questioned from Ottawa and the Taylor Engineering Company is free to proceed with its plans for the opening up and the placing upon a producing basis of the Alice Arm property.

The new mine staff, which has left for the North, is headed by Major D. E. Young, who has resigned from the Provincial Commission to accept the general managership of the Taylor Mining Company, Limited. Major Angus W. Davis, late of the staff of the Consolidated Mining & Smelting Co., at Trail, has been appointed superintendent of the mines. He will be assisted for a time by R. B. McGinnis, of San Francisco, formerly manager and engineer for the Dolly Varden Mining Company. The position of chief accountant and storekeeper, will be filled by H. S. Brownin, formerly office manager for the Canadian Collieries, Limited.

There is a short section of the grade of the railway from Alice Arm to the mine which has yet to be connected up by steel. For this purpose a cargo of rails is being taken north, and the work involved will be undertaken immediately. The Dolly Varden Company, before ceasing operations at the mine, is reported to have blocked out 20,000 tons of high grade ore. This, it is expected, will be shipped as soon as transportation facilities are provided.

The Taylor Mining Company, Limited, which has been organized for the special purpose of operating the properties in question has an authorized capital of $1,500,000, of which $1,200,000 is paid up. Assisting Mr. A. J. T. Taylor, the president, are R. P. Butchart, of Victoria, president of the B. C. Cement Company; Mr. H. C. Chiene, C. A., of Buttar and Chiene, who is also trustee for the creditors of the Taylor Engineering Company; Charles M. Rowlson, general manager of the Imperial Oil ompany, Vancouver, who is also acting as trustee for the debenture holders of the Taylor Mining Company, and Mr. John F. Tener, general manager of the Pacific Lime Company.

Major Angus W. Davis, the new superintendent of the mines, is a leading western mining authority. Before the war he was in charge of the Richmond Eureka Mine at Sandon, the Snowshoe Mine and the No. 7 Mine in the Boundary District and the Sullivan Mine in East Kootenay, all of which are properties of the Canadian Consolidated Mining and Smelting Company. He went overseas as a competent officer with the First Canadian Division, and because of his technical knowledge, was selected to organize and command the Third Canadian Tunnelling Corps, which post he held until mining operations at the front, in a large way, ceased with the successful mining of Messines Ridge. Subsequently he was in command of the Tenth C. E. Battalion.

Major D. Drummond Young, D.S.O., formerly Adjutant of the 72nd Battalion, C.E.F., who will be in charge of the general business and financial affairs of the company, has had considerable business and executive experience in England and in Canada, and his services were also requisitioned by the general staff in France.

A CORRECTION.

In our issue of the May 21st (page 367), it was incorrectly stated that Mr. Victor Dolmage, of the Geological Survey, Ottawa, had prepared a Report on the Cariboo Gold Fields, from the summary of which we quoted extracts. We now understand the Report was written by Mr. B. R. McKay, and are glad to make this correction.

PROF. WM. NICOL,
Professor of Mining, Queen's University, Kingston.

EXPLOSIVES BRANCH, DEPT. OF MINES.

Proposed Explosives Testing Station at Ottawa.

Joseph G. S. Hudson, of the Explosives Branch, Department of Mines, Ottawa, is making a tour of Canada on business of considerable importance to the mining industry. At present he is in British Columbia and has interviewed the Hon. Wm. Sloan, Minister of Mines, and other officials in the Provincial Department of Mines. He announces that it is the intention of the Federal Government to erect at Ottawa a powder-testing plant modelled after that at Woolwich, England, and the equipment of the U. S. Bureau of Mines at Pittsburgh. At the present time there is no provision in Canada for the official testing of explosives used in the mines of the country. The provincial governments have been authorizing the use of those explosives passed by United States government authorities or recognized and approved by the British government. Whatever course has been pursued, however, has been on the initiative only of the province and the policy therefore has by no means been uniform. Moreover, if necessity arose for the testing, say of powder or a certain grade of powder, and the coal dust of the mines in which it was proposed to be used, it was necessary to send samples either to Woolwich, or to Pittsburgh. With a plant at Ottawa as is proposed, not only will a uniform list of authorized explosives be adopted in Canada, but it will be possible for all such testing and experiments to be carried out within the Dominion. It is understood also, that manufacturers of explosives will be required to submit their output to test in the official laboratory and will be required to lay out their plants to conform to standard practice, so that plans of new establishments will have to be submitted to the proper quarters for approval. Another innovation suggested, is that regulations regarding the sale of explosives shall be uniform throughout the Dominion. This will be a marked improvement over the present somewhat haphazard method. Mr. Hudson's mission, therefore, is to lay these various proposals before the heads of the Mines Departments in the different provinces, explain them in detail, obtain suggestions, and generally to come to a clear understanding of the objects aimed at, so that when federal legislation is finally drafted it will meet conditions in all parts of the Dominion and be unanimously approved.

Dispute re Alice Arm Molybdenum Claims.

The case of Stewart vs. Molybdenum Mining and Reduction Company is being tried before the Supreme Court of British Columbia, involving a well known Alice Arm property. It appears that the defendant company started in to develop two claims on Alice Arm carrying molybdenum and about $100,000 was spent in the erection of mill, aerial tramway and other equipment. Subsequently a question arose as to the soundness of the title to the property. The plaintiffs claim that they were entitled to be paid some $35,000 under a bond which had been given to Stewart, McGraw & Haines by one Riel. After getting this bond, it is alleged, the claims were allowed to lapse through failure to do the assessment work required by statute, and it is asserted that the property was re-located by Riel and conveyed by him to the defendant company in consideration of the company alloting to him a large block of the stock, the conveyance to be free of all encumbrances. Later a dispute arose between Riel and the Company and Riel is now assisting the plaintiffs to upset the title of the Company to the claims.

Use of Diamond Drills Increasing in B. C.

Diamond drilling is being used to a larger extent in British Columbia in mining development than heretofore. The Provincial Government is carrying on operations of this character on the Snowstorm group of copper claims in Highland Valley near Merritt, B. C. The work was started last January and five borings have been completed. The sixth is now down over 600 feet. While no first hand information is available as to the results up to date, it is understood that the showings generally are good and that the outlook is considered promising. Drilling also has started on the property of the Aspen Grove Amalgamated Mines, Limited, which is under bond to Joseph Errington, and associates. This property includes about 75 mineral claims and the plan is to drill at least ten thousand feet for the purpose of proving the ore body. The surface showings indicate an extensive zone with good values in copper.

Haematite Deposits, Iron Mountain, B.C.

Three groups of haematite iron deposit have been located on Iron Mountain, B.C., and work has been in progress on two of them for several weeks. The Iron Dollar group is said to show extensive bodies of high grade haematite ore while the Titanic Group, situated on Sheep Creek, shows a body of brown haematite, the size of which has not been determined. A shaft is being sunk and thus far the workings are all in iron, the analysis of which shows metallic value as high as 63 per cent. One feature of the analyses is the comparative absence of sulphur, etc. The ores of the Titanic Group carry 4.35 per cent. lime, 3.41 per cent. carbonic acid, 1.50 per cent. silica, and insoluble silicate, .22 per cent. alumina and 27 per cent. oxide, with the 63 per cent. metal and only a trace of phosphorus, magnesia, and sulphur.

Improved Outlook in Portland Canal District.

News from the Portland Canal District continues to indicate much mining activity. The Premier Mine on Salmon River is reported to be developing a very attractive body of ore. This property has been examined recently by H. B. Price of New York; W. W. Warren, of Butte, and W. H. Young, of San Francisco. The Bush Company has commenced work on its property, which is located near the Premier. H. Howson, a mining authority, has made an examination of the Yellowstone group, which was recently bonded by Charles F. Caldwell, operator of the Utica Mine, Kaslo. The snow is reported to be disappearing from the higher ranges and prospectors in numbers are leaving the town of Stewart for the hills. Stewart, which since the 1910 boom broke, has gone from bad to worse, is becoming a very busy little community. Several new business enterprises have started and mining men, prospectors and business men are going in with every boat.

The Skeena Mining & Milling Company, Ltd., has secured a working bond on the Victory and Coronado Groups, Hudsons Bay Mountain, Northern B. C. These are the silver-lead zinc properties, very promising in character as far as development has gone. A 50-ton a day concentrator is to be installed and other equipment provided for the operation of the claims. The total expenditure involved being about $30,000.

Development Promised at Summit Camp, Tulameen District.

One of the most important mining deals reported from the Tulameen District in months occurred recently when Arthur E. Hepburn, of Vancouver, took a bond on seven mineral claims in Summit Camp. The claims included in the option are the Sutter No. 7, Nickle Plate, Huckleberry, Huckleberry Fraction, Sunlight, Sunbeam and Jumbo. It is understood that Mr. Hepburn is acting for English capitalists who propose to do considerable development work this summer. These properties it may be explained, are in silver-lead ore, one vein of which is said to range in silver values from 60 to 80 oz. with a percentage of lead sufficient to produce assay results as high as $300 per ton. Another lead shows about 12 in. of clean high grade ore in which some exceptionally fine values have been found.

Eureka Mine, Nelson.

The Eureka Mine at Nelson is turning out well under development, the ore body on the 250 ft. level being 17 ft. wide. The Granite-Poorman mill has been fitted up with a concentrator for the treatment of the ore and a flotation plant added. The ore is copper, carrying appreciable gold and silver values.

Progress at Sheep Creek.

Development of mining on Sheep Creek, near Salmo, B. C., has attracted much attention recently. The properties on this work is in progress look more promising as they are opened up. At the Nugget Mine excellent progress is being made with the long tunnel designed to crosscut and develop, at depth, the veins on the Nugget property. This tunnel has now been extended 350 feet, and is being continued at the rate of 200 ft. per month. In the course of a few months it will have attained its objective when the ore bodies will be opened up by raises and stopes prepared for mining. The Mother Lowe Mill then be placed in commission again and run to full capacity. Much is looked for in a mining way from Sheep Creek which is considered one of the best of British Columbia's gold fields.

VANCOUVER SYMPATHETIC STRIKE.

The strike of the steamer hands on the Pacific Coast Steamers is affecting the large mines up the Coast. Although the supply at the present time is sufficient, should the strike continue much longer it will be a serious matter unless some provisions are made for operating steamers to and from the different plants.

At the present time the Citizens' Protective League is being formed and plans are being perfected to obviate any serious conditions which may arise. Meantime all plants are getting along as best they can under the conditions.

IMPERIAL MINERAL RESOURCES BUREAU.

The Governors of the Imperial Mineral Resources Bureau have appointed Major W. M. Henderson-Scott, 1st Queen's Westminster Rifles, to be secretary of the bureau in place of Mr. Arnold D. McNair, C.B.E., who has resigned the appointment of organizing secretary.

Major Henderson-Scott is a gold medallist of the Royal School of Mines and an Associate of the Institute of Mining and Metallurgy. He has practised mining extensively in North and South America and has served continuously in France since 1914.

NORTHERN ONTARIO.

Nipissing Production.

During the month of May, the Nipissing mine produced $347,751, or an average of approximately $11,218 every 24 hours. This shows an increase of $127,824 over the April figures, and is the highest monthly production this year, and may reasonably be attributed to the exceedingly favorable developments on vein 109 and 99 noted during recent weeks in these columns.

In his regular monthly report to the president and directors, Hugh Park, manager, says:—

"During the month of May the company mined ore of an estimated net value of $347,751, and shipped bullion from Nipissing and custom ores of an estimated net value of $102,578.

"All stoping operations and general underground exploration and development continued to be satisfactory throughout the month. At 96 tunnel, development work on veins 99 and 109 continued to show good results, though not as continuous as in April. Vein 99 now shows 60 feet of ore, averaging two inches in width and assaying in excess of 5,000 ounces to the ton. In addition some 30 feet produced irregular amounts of high grade ore, the country rock, however, being of sufficient grade to be treated at the low grade mill. Vein 109 has been drifted on for 230 feet, and about 130 feet will assay in excess of 5,000 ounces to the ton over a width of two inches. The balance contains mill rock and some high grade ore.

"Owing to excessive surface water, some difficulty was encountered in starting new development operations at a level 90 feet below the tunnel. These difficulties have been overcome and cross-cutting has been started. Vein 109 is expected to be cut at a distance of 75 feet, and vein 99 will require somewhat more.

"At shaft 73, developments on vein 544 at the 550-ft. level were more or less satisfactory. Several raises were put up, and while developments indicated continuity of the vein, the silver contents were just too low to be profitable. A level higher up is necessary, and a station is being cut 50 feet higher up and the vein will be developed at that level.

"Stoping operations at 73 shaft continued to be satisfactory. No new veins were encountered in any of the cross-cuts. No favorable developments were met with at shafts 63, 64 and 128, Shaft 27 is being dewatered for examination. This shaft has been idle for the past 11 years.

"The low grade mill treated 6,645 tons of mill rock and 184 tons of high grade ore. The refinery shipped 101,053 fine ounces of bullion.

"The following is an estimate of production for the month of May:

Low grade mill	$177,126
Washing plant	170,625
Total	$347,751"

Miller Lake-O'Brien Mine.

The Miller Lake-O'Brien Mine, of the M. J. O'Brien, Limited, at Gowganda, is to be extensively explored, in addition to the usual amount of development work, according to reports coming from Gowganda.

Swastika.

High gold assays have been obtained from samples taken from a large sulphide dike, which runs east and west for several miles, crossing the boundary between the townships of Otto and Eby, a short distance south-west from Swastika. As a result, quite a large number of mining claims are being staked in that vicinity.

The first samples taken, show a gold content of upwards of $400 to the ton, with several ounces of silver per ton, as well as a trace of platinum. Steps are being taken to do further sampling in an endeavor to check up the former assays.

Lucky Baldwin Mine.

Operations at the 200-ft. level of the Lucky Baldwine mine, at Kenogami Station, continue to be encouraging. Cross-cutting is being done in a large dike of porphyry, in which bands of highly mineralized matter occurs. It is stated that certain sections of the dike carries gold in commercial quantities. A force of about twenty men are employed, and the motive power is supplied by a small steam driven mining plant. Some visible gold has been encountered.

Opening of Haileybury Mining School.

The formal opening of the Haileybury Mining School is to take place June 19th. The Hon. Dr. Cody, Minister of Education, will be among the distinguished visitors.

It is interesting to note at this time, that Federal support for technical education aggregating ten million dollars within the next ten years, the money to be paid to the provinces, is provided for in a resolution of which notice has been given by Hon. J. A. Calder, Minister of Immigration and Coloniaztion.

The Haileybury Mining School may reasonably be expected to share in the benefits of such assistance, and it is anticipated that it may make possible the plan which has been proposed to give short courses to returned men in milling, assaying and metallurgy.

Reeves-Dobie Mine—New Oil-flotation Plant.

The 100-ton oil flotation plant, being installed on the Reeves-Dobie Mine, at Gowganda, is nearing completion, and should be ready for operation very shortly, according to official information.

The property was formerly equipped with a forty-ton stamp mill, to which it is expected additional grinding equipment will be necessary in order to operate the flotation plant at full capacity. It is stated that not much difficulty is expected in being able to keep the plant running at full capacity on medium grade ore.

It has been definitely announced that the Nipissing Mining Company has dropped its option on the Ophir-Cobalt mine. The option had been held for some three months, during which time a considerable amount of exploration work was done with varying results. At two points, during the course of drifting operations, short shoots of ore were encountered, and apparently the result of work did not appear to justify the purchase of the control of the property.

Whether or not the Ophir Company will itself continue to operate the property, or interest other prospective purchasers has not been learned.

Dome Mines.

The directors of the Dome Mines, during their recent visit to the property, expressed themselves as being very well pleased with the progress so far made and as being decidedly hopeful of a prosperous future. The mill is operating at a moderate rate, and it will probably be some little time before full capacity is reached. However, between 300 and 400 men are now employed, and with efficiency increasing, it is expected almost normal conditions will prevail by the end of the current year.

Development work being conducted on the Dome Extension, which is under option to the Dome Mines, is favorable, and the general impression is that the option will be exercised before next March.

Kirkland Lake Proprietory Merger.

The merging of the interests of the Tough-Oakes Gold Mines, the Burnside, and the Alladin-Cobalt, including the Chambers Ferland mine at Cobalt, and the Sudbury Syndicate, is stated to be making satisfactory headway. The new company is to be known as the Kirkland Lake Proprietory. The Sylvanite is not mentioned in a statement just made, which may be summarized, as follows:

(1)—The Kirkland Lake Proprietory Company, whose issued capital is 125,000 pounds, will receive 250,000 shares in the new issue. That is to say, when the merger is completed, shareholders will receive a bonus of one share in addition to each share now held.

(2)—Shareholders in the Tough-Oakes Gold Mines will receive one Kirkland Lake Proprietory share for each two shares held in the Tough-Oakes Company.

(3)—Shareholders in the Burnside Gold Mines will receive one share in the Proprietory Company for each two shares held in the Burnside Company.

(4) Shareholders in the Sudbury Syndicate will receive 1¼ shares of the Kirkland Lake Proprietory for each one share held in the Sudbury Syndicate.

(5)—Shareholders of the Aladdin-Cobalt will receive two Kirkland Lake Proprietory shares for each seven shares held in the Aladdin-Cobalt.

The Kirkland Lake Proprietory is to be capitalized at 800,000 pounds, as against a present combined capital of the various companies of about 2,000,000. There will be about 100,000 cash in the treasury.

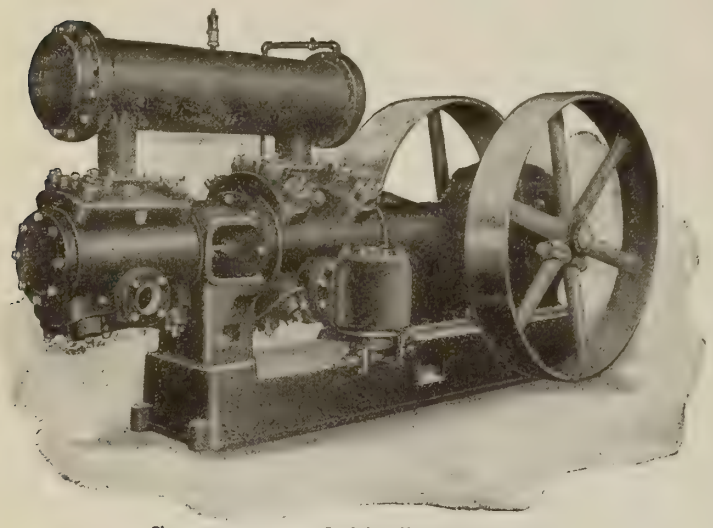
Shareholders Not Alarmed.

The labor situation in the mining fields of Northern Ontario has become more or less disquieting, following the actual declaration of a strike in the Kirkland Lake camp. At Cobalt the result of the strike vote taken last Sunday has not been made known at the time of writing. In the meantime, operations are proceeding in a normal way, and there is a tendency to view the matter as one that will be but temporary, and that the value of the mines, should actual curtailment be necessary for a time, would not deteriorate, and thus leaves no reason for panic among shareholders. The great pity, of course, is the more loyal the subject, the greater may be the hardship imposed. For instance, returned men in many instances declare that they are only beginning to "get on their feet," while many of those who did nothing for the country during the war have large bank rolls and will not suffer.

ECONOMY OF COOL INTAKE AIR FOR AIR COMPRESSORS.

Temperature plays an important part in all compressed air engineering; the intercooler exists mainly to cool the air between low and high pressure cylinders of the air compressor so that dangerous temperatures are not reached in the high pressure cylinder. In large shipyards reheaters are sometimes used to heat the air before being used in pneumatic tools; this has the double advantage of reducing trouble from "freezing," and increasing the volume of air supplied.

A simple way of increasing the over-all efficiency, and one that is not taken advantage of as much as it might be, is to place to the air compressor intake in as cool a place as possible. The cooler the intake air, the larger is the final volume of air delivered to the tool; this is realized by some, but by putting this



Canadian-Rand Air Compressor.

fact in cold figures the startling fact is brought out that every five degrees drop in the temperature of the intake air represents again in power of one per cent. For this reason the intake pipe for an air compressor should be placed so that the air is taken from outside the engine room; this is not only cooler than the air inside the engine room, but considerably cleaner. It might be thought unnecessary to insist on this point, but there are many compressor installations which show that this is not the case.

The intake pipe for an air compressor should also be made of ample diameter, at least half the diameter of the low pressure cylinder; and the longer the pipe, the larger should be the diameter. A rule given in "Compressed Air Data" is to increase the pipe diameter by one inch for every ten feet of length. The air should be taken in some distance from the grounds, say eight or ten feet above ground level.

DOME.

Toronto, June 6.

Mr. J. S. Bache, the president of the Dome Mines, and his fellow directors on that board, will leave tonight for South Porcupine, where they will examine both the Dome and Dome Extension properties preparatory to the annual meetings of these companies, which occur next week. The annual meeting of the first mentioned company is set for next Tuesday and that of the latter for the day following. Mr. Alex. Fasken, the secretary of the company, goes North along with the other officials. This is Mr. Bache's first visit to Cobalt and Porcupine.

NORTHERN ONTARIO.

The substantial reduction in the tariff as applicable to mining machinery, the greater portion of which is imported into Canada, will come as a pleasant surprise to mining interests, and will probably be all the more appreciated. Although the plea has been made on various occasions during recent years, that the precious-metal mining industry should be shielded from excessive taxation, yet very little was done in response to the plea, and the fear that the mines must survive as best they could in so far as the government was concerned, appears to have become fairly general. Now, however, a step has been taken for the benefit of the mines, or at least, such is the proposal of Finance Minister Sir Thomas White.

The Budget speech, as viewed by many representative business men of the North, has met with much approval in that it will draw most heavily upon the purse strings of the richest people in the country.

In discussing the matter with one of the men in this district who will be materially affected by the new Income Tax, the writer was informed that the government had made a step in the right direction. "It is only fair," he said, "that those fortunate enough to have won a position involving enormous income should bear the brunt of taxation." He also intimated that it was his honest opinion that this method of collecting government revenue was here to stay. "Men who are energetic, and win good fortune by denying themselves many of the pleasures of life by remaining almost constantly at work attending to the affairs of their business are certainly entitled to greater income than the men who will neglect their work and join the pleasure bent. This is a point that the government should not forget," he said. "Yet, despite this, all men who try their best do not succeed, and it is only fair that the large incomes should be severely taxed. In doing this, the government should not apply the measure to the point of confiscation for the reason that such would discourage thrift, and rob the country of the benefits won through the energy of the men of the soundest abilities."

THE CONFUSION OF INDUSTRIAL AND POLITICAL ISSUES.

The European commission of the National Industrial Conference Board (New York), which has just returned from Europe says that "solution of the world-wide unrest problem rests largely upon the separation of political and industrial issues." But is it not the aim of labor leaders to make political issues of all industrial difficulties? It is the separation of industrial issues from politics which is considered by present day labor leaders to be the weakness of the labor cause, and they show a tendency to use the massed political power of labor to adjust the most trivial industrial issues, which is indeed the whole idea behind the sympathetic strike.

THE COAL MINERS STRIKE IN CROWSNEST FIELD.

The following copy of correspondence which has passed between those concerned in the present coal miners' strike in the Crowsnest Pass Coal Field, British Columbia, and which strike now is in effect throughout District 18, fully explains the existing condition as between the men and the company:

From Gladstone Local Union, Fernie, B.C. to the Pit Bosses:

Fellow workers:—We wish to draw your attention to the fact that we are at this time engaged in a struggle to maintain the just rights of a certain portion of our membership. We think it is hardly necessary to point out to you the fairness of our demands, as you must readily realize that with the cost of living forced up to the limit, whereby it is impossible for the worker to support himself and family, it is absolutely essential that there be no reduction in wages at this time, but rather a general increase all around is needed to offset the ever-increasing cost of the necessities of life.

It has come to our notice that the coal company intend to use your services to replace those of some of our members who are out to secure a living wage.

Fellow workers, we appeal to you not to permit yourselves to be used for such a despicable purpose. We would ask you to fall in line with the fire bosses, who to a man refused to fill any job of a man who is out on strike. We realize the position they have placed themselves in by such action, and we certainly admire their courage. The members of Gladstone local union have already pledged themselves not to resume work until all fire bosses are reinstated without prejudice or discrimination on the part of the management, and are ready to take the same stand with regard to yourselves (pit bosses.) We ask you to think the matter over carefully. Is is worth while to earn yourselves the animosity and ill-feelings of all right thinking men, to pander to the wishes of those who, however much they pretend to have your interest at heart, would if it suited their purpose, take the same stand in regard to yourselves that they are taking with the ten and eleven-hour men at the present time?

(Signed) "Gladstone Local Union, per Secretary."

Reply of Pit Bosses.

In reply to the foregoing the pit bosses directed a letter to the members of the miners' union, the essential part of which reads:— "Most mine officials are holding their positions, not only through the company's choice, but by government qualification, and in the ordinary course of affairs are responsible to both parties for the safe and efficient management of their respective departments. At the present time, owing to the conditions created by a general suspension of work they are simply trying to limit the unavoidable damaging of property, upon whose welfare the city of Fernie depends for its very existence.

Should we imitate the example of the firebosses formerly employed at Coal Creek mines, who, taking a different view of the obligations inherent to their position, ceased work immediately the general strike order went into effect, we would render ourselves guilty of a very grave breach of trust and an action that all right-thinking men could not fail to consider as highly reprehensible

We might further state that at no time has the management required of the officials to do any kind of work other than that strictly covered by the Strike Clause included in the agreement still in force.

Management's Statement.

The management of the Crowsnest Pass Coal Company, Limited, have under date of May 31st, issued the following public statement:

A circular has been issued by the Gladstone Local Union to the officials of the company, urging them to stop work and assist them in getting "Justice" for certain of their fellow employees. The agreement effective in the mines of District 18 when the strike was declared, entered into between the United Mine Workers and the operators of the district, and in force under the jurisdiction and direction of the federal government through the commissioner, Mr. W. H Armstrong, director of coal mine operations, contains clauses with respect to the management of the mines, the employment of officials and the care of the mines during strikes. These clauses read as follows: —

Management of Mines.—The right to hire and discharge, the management of the mines, and the direction of the working forces are vested exclusively in the company, and the United Mine Workers shall not abridge this right; however, the company agrees not to discharge employees or refuse work of applicants on account of, or because of their affiliation with the United Mine Workers of America.

Employees Not Under Jurisdiction.—All employees connected with the management of the mine are not to be under the jurisdiction of the United Mine Workers of America, or the members thereof, and shall include the following:—

Mine.—Manager or superintendent overman or assistant overman, pit bosses, firebosses, stable boss, master mechanic, electricians, weighmen, head carpenter, head blacksmith, tipple or breaker foreman loader boss, night watchman, coke oven foreman, outside foreman and all other foremen, timekeepers, inspectors and head lampmen.

In case of either local or general suspension of mining either at the expiration of this agreement or otherwise the engineers, firemen and pumpmen shall not suspend work, but shall when mining is suspended fully protect all the companies property under their care and operate fans and pumps and lower and hoist such men and supplies as may be required to keep up steam at the companies plant, but it is understood and agreed that the company shall not ask them to hoist any coal for sale on the market.

These clauses have appeared in every agreement between the United Mine Workers and the operators of District 18 since the first agreement negotiated between them and represent the opinion of both parties that the preservation of the mines in working condition, ready for resumption of work was simply economic horse-sense and desirable as much from the point of view of the one side as the other, no matter what the dispute at the moment might be. Hitherto these clauses have been loyally lived up to and the settlement of grievances has been followed by practically immediate re-employment of all workmen.

Agreement Violated.

The circular just issued by the miners officials, however, indicates a new policy on the part of those at present in control of Gladstone Local Union. In fairness to itself the company wishes to give publicity to the fact that, in expecting its officials to remain at work for the protection of the mines, it is doing what

it has always done, and what the United Mine Workers of America have agreed it has the right to do; that those officials who have remained at work have similarly done as they have always done, and as the U. M. W. of A., have undertaken they shall have perfect freedom and right to do, and that, in taking their present attitude, Gladstone Local of the U. M. W. of A. deliberately and knowingly violates its own signed undertaking in the expectation that the added pressure resulting from a knowledge on the part of the company that its mines are suffering damages, will force settlement of their demands."

The Gold Miners Optimistic.

Leading mining men in the gold camps claim to be able to see the end of the present economic strain, and appear to believe that conditions will get back to nearly normal by the end of the current year. The labor unrest is viewed as but a temporary retarding factor, and that in due course it will be realized that the industry is bigger and better than is at present understood. It is believed that the number of men employed in Porcupine is now a little in excess of the number at the Cobalt mines.

McIntyre-Porcupine.

The development of rich ore on the McIntyre-Porcupine, now being reported in certain portions of the press, has reference to the favorable development reported some little time ago in these columns. It will be recalled that the Journal pointed out the fact that about one million dollars in new ore had been developed at and above the 800-ft. level of the McIntyre as a result of recent development work.

Strike at Kirkland Lake.

The mine workers of the Kirkland Lake camp ceased work, Thursday morning, June 12, following the presentation of certain demands which the mining companies refused to grant. Upwards of 500 men are involved in the walk-out.

The Miners' Union had demanded, as previously stated in these columns, a minimum wage of $4.50 daily to underground workers, a 44-hour week and recognition of the Union. At the time of writing, the mines in the Kirkland Lake field are closed down, it being the apparent intention of the companies to await further developments, before taking definite steps to cope with the situation and make arrangements to ultimately resume work.

MAGNESIUM SULPHATE DEPOSITS AT BASQUE, B.C.

The "Canadian Chemical Journal" contains an account by George C. Crux of a chain of lakes near Basque, B.C., from which very pure magnesium sulphate may be easily obtained in quantities not hitherto available. The lakes, as described, seem to form a series of natural evaporators. It is intimated that the salts enter the lakes from below in solution, and the crystallized salt is deposited in a circular ring around the lake in the summer. From March until June or July it is stated the deposited ring of salts is under water. In the vicinity of one lake alone, it is estimated that 6,000 tons of high grade technical magnesium sulphate is immediately available, and in one place drilling has shown pure Epsom salts to a depth of forty feet.

Oxy-Acetylene Welding and Cutting

SOMETIMES THE ONLY WAY—GENERALLY THE BEST WAY—ALWAYS A POSSIBLE WAY.

Wherever two pieces of metal are to be joined, the Prest-O-Lite Process of Oxy-Acetylene Welding provides a simple, low-cost method. It opens the way to metal manufacturing, construction and repair operations which cannot be performed by any other process.

In practically every metal manufacturing industry oxy-acetylene welding is providing better, neater-appearing and more lasting joints than have been hitherto obtainable by rivetting, threading or other metods, and at the same time is lowering production costs. Operations on metal parts, large and small, are handled easily, quickly and economically by this process. Welded joints can be built up to give added strength if desired. The metal is left in satisfactory condition for subsequent machining. For repair work it more than pays its way—preventing costly delays and replacements—handling the jobs "right on the spot" with efficiency and dispatch.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones. Provides dry, purified gas, insuring better welds quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe, automatic regulators and gauges, and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow pipe.

This Welding Outfit is portable and handy for use inside or outside the shop. The Prest-O-Lite system of exchanging your empty cylinders for full ones insures perpetual service.

Write for valuable illustrated literature and data on work others are doing by the Prest-O-Lite Welding Process. It may point out ways to solve your problems.

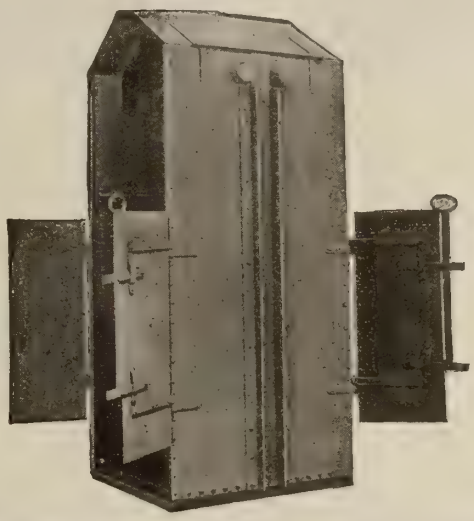
SAFETY MINE CAGES

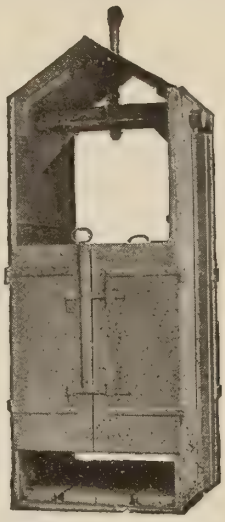
MADE TO FIT YOUR SHAFT

We build these Cages to suit you and your workmen. They are Safe, Strong, and Reliable.

¶ The top doors permit the carrying of long timbers, or the escape of the men in case of accident.

¶ The hand rails are properly placed to safeguard the passengers in the quick ascent or descent.





¶ We supply these cages with either one or two sets of doors for inlet or exit, to suit your shaft.

¶ Rails are also laid in the floor, if required, for convenience in handling the cars.

MARSH ENGINEERING WORKS, LIMITED, Established 1846 **BELLEVILLE, ONTARIO, Canada**

Sales Agents: MUSSENS, LIMITED, Montreal, Toronto, W nnipeg and Vancouver

NORTHERN ONTARIO—GENERAL.

The installation of a small mining plant on the Collins property, at Leroy Lake, in the Gowganda district, is about completed, and will be ready for operation very shortly. A shaft was formerly put down about 130 feet, with encouraging results, and it is proposed to resume work at the point where formerly left off.

A vein said to be several feet in width has been opened up on the La Bine group of claims in the Sesekinka district, in the township of Maisonville. At a point where one of the formerly discovered narrow high grade veins joins the large vein, a good deal of mineralization occurs, showing telurides of gold, as well as free gold. The resemblance of the Seseknika area bears much in common with the Boston Creek district.

A second vein has been encountered as a result of diamond drilling on the Independence Mine, at Boston Creek. About three feet of vein matter has been penetrated in the new vein. As yet the mineral content has not been determined.

With the completion of cross-cutting operations at the Dome Lake, for the purpose of opening up the ore body recently indicated by diamond drilling, it is expected very little difficulty will be experienced in keeping the Dome Lake mill running at full capacity.

It had been planned to arrange for the early resumption of work at the La Belle-Kirkland Mine, but, owing to the rather uncertain trend in the labor situation, the commencement of operations may be temporarily deferred.

ANYOX COKE OVENS TO RECOVER COAL TAR PRODUCTS.

Dr. M. E. Nichols, President of the Granby Consolidated Mining and Smelting Company recently finished a trip of inspection to the Pacific Coast.

It has been known for some time past that coke ovens were being erected at Anyox and the fact that they are now completed and ready for operation is of great interest to the industrial world and adds another important branch of the mining industry to British Columbia.

While in Vancouver, on his return from the company's Anyox plant, Dr. Nichols made the following announcement, that the heating up of the coke ovens at Anyox, which will be the first on the Pacific Coast to be operated for the recovery of toluol, benzol and the other valuable by-products of coal tar, has been started.

The armistice has taken away the necessity for the production of explosives, for which purpose the ovens were originally planned, but they will prove a valuable source of coal by-products for commercial uses. The tar will be shipped to Vancouver where the distillates will be recovered in a local works.

Dr. Nichols stated that the expensive installation of the recovery ovens was not altogether necessary, as the old beehive ovens would have suited their purpose just as well, but the war has shown that by-products would warrant the additional outlay. Formerly Germany has been by far the greatest manufacturer of dyes and other products of coal tar. These new coke ovens will now form a part of the national plans to capture this trade.

More than ever the Mill determines the profit

As the mining industry swings forward mere "rocks" become "ores." Tailings piles spring into life as "bonanzas." Ores of lower and lower grade are worked.

It is all a story of treatment methods. Reductions in treatment costs turn one time waste into "gold." More than ever the mill determines the profit.

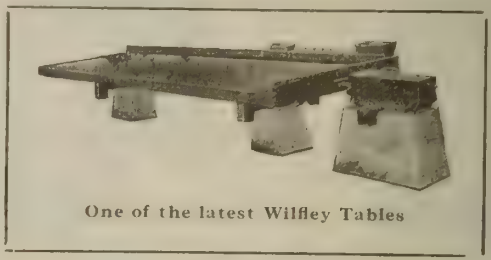
The possibilities of the Wilfley Table, the Marcy Mill and other Massco products for the mill warrant careful investigation.

Massco equipment has been making interesting changes in cost sheets.

The past few years have seen important advances in the design of mill equipment.

* * * * * *

Many improvements have been added to the Wilfley Concentrating Table—increasing its already high metallurgical and mechanical efficiency. One of the newest features of the Wilfley is a fully enclosed, self-oiling head motion of great simplicity and strength.



One of the latest Wilfley Tables

A Wilfley Table may now be obtained for concrete foundations—the steel channels are not required—strength and other mechanical advantages are retained fully.

The Wilfley Table has more than kept pace with the requirements of the times—it is a step ahead.

Have you full facts?

* * * * * *

In 1915 the Marcy Ball mill was introduced into commercial service. Its early results were revolutionary and it has since consistently given capacity that was thought impossible and costs far below the rock bottom figures set for other types of equipment.

The largest capacity ball mill plant in the world uses Marcy Mills and Marcy Mills are now grinding over 60,000 tons a day in approximately 200 plants. If you haven't the Marcy No. 42 Booklet you will certainly appreciate a copy. Just ask our nearest office.

VOCATIONAL TRAINING.

Prof. H. E. T. Haultain has resigned as Vocational Training Officer for Ontario. He has built up a splendid organization to carry on the vocational training of returned soldiers. From small beginnings there has been developed in a very short time a big institution which is effectively aiding men returned from overseas, teaching them, finding them suitable work and caring for them continuously. Prof. Haultain has been very largely responsible for the success of the work in Ontario. Many hundreds of men are given a fresh start in life by the Department of Soldiers Civil Re-establishment. Prof. Haultain has made every effort to see that the fresh start is a good one, and he is not satisfied with that. His provision of an after-care department indicates the thoroughness of the work. On another page will be found an outline of the organization of the Ontario branch. We recently visited the "plant" in Toronto, and found it a very hive of industry. The most "conservative" investigator would doubtless admit that "it's not bad—for a professor."

The several hundred members of his staff have shown their appreciation of Prof. Haultain's services by presenting him with a splendid automobile on the occasion of his return to professional work. They know better than anyone what he has accomplished, and his new car cannot be regarded as a mere machine, but rather as an expression of the admiration of a large number of men and women who have worked under his direction, and who appreciate what he has done for those returned soldiers who most need assistance on their return to civilian life.

THE REPORT ON GOLD DEPOSITS.

In the June number of "Economic Geology" there is an interesting article by Dr. Cooke of the Geological Survey of Canada on the Matachewan gold deposits. The two best known properties, the Otisse and Davidson, are described in some detail. The subject of Dr. Cooke's paper is the origin of the deposits, and his paper indicates that we have at Matachewan conditions quite different from that at Porcupine or Kirkland Lake. There are some striking similarities in all three cases; but there are also as notable differences. It takes considerable study to permit of the writing of such a paper as that of Dr. Cooke's, and he deserves our thanks for recording his observations. It might have been of greater service, however, if the paper had been published in a Canadian rather than an American journal.

We are of the opinion that it is an advantage to Canada to have information concerning our ore deposits published in foreign journals, but it seems strange that such an account of observations, made at the public expense, should be published abroad before the Geological Survey has given out in Canada any report on the area.

We have on several occasions invited the Department of Mines to utilize our columns to give out preliminary reports on areas of economic interest, examined by the Department's geologists. We have offered to co-operate, because we believe it is of more use to have incomplete reports soon after examinations are made than more exhaustive reports a year or two later. In this case there has not only been a long delay, but the information is given out first abroad.

FORGOTTEN HISTORICAL EVENTS.

Toronto "Saturday Night" under the above caption says, editorially:

"We are in danger here in Canada in following the blind lead of slap-dash American historians whose knowledge of events outside their own country is sometimes very limited. For instance, Canadian newspapers that should know better, carried a story the other day of the "Conquerors of the Atlantic" being a summary of the great feats that had been performed, and among them was the statement that the first vessel to cross the Atlantic under steam was the "Sirius," that feat having been performed in the year 1838. Now, it so happens that the first vessels to cross the Atlantic, steaming every inch of the way, was the Canadian-built "Royal William," and this feat took place in the year 1833, or five years before the "Sirius" crossed the Atlantic. Back in the year 1830, the American steamship "Savannah" crossed the Atlantic under a combination of steam and sail. In other words, she utilized her engines only a portion of the time. On the other hand, however, the old "Royal William," built in a Quebec shipyard, by a Canadian company, commanded by a Scotch-Canadian, manned by a Canadian crew, and burning Canadian coal, mined at Pictou, N.S., was the first vessel to cross the Atlantic or any other ocean, propelled all the way by steam power. If our schools do not teach such events as these they should, so that the children may at least put the old man right on Canadian historical events."

"Shipping" of New York—a weekly which we happen to know is largely energized by a Scot—says:

"The transatlantic passage by a flying machine, invented in America and operated by Americans is a fitting close to a century which began with the first transatlantic voyage by steam, also accomplished by an American-built vessel and operated by Americans."

Perhaps history will again repeat itself, and our grandchildren may be allowed to forget that the first non-stop Atlantic flight was achieved in a British-built plane by British flyers.

"Shipping" also remarks that while railway transportation "cannot be claimed as distinctly an American device, the construction of railways in the United States began only three years later than the Stockton & Darlington Railway in England, which is looked upon as the beginning of the steam railway system of the world."

We believe the Abercombie Railroad, which ran from Stellarton mines of the General Mining Association to Pictou Landing, and on which the coal for the bunkers of the 'Royal William" was doubtless carried was the first steam railroad in America, and some years ago the original steam engine was taken away to be exhibited at some United States exposition—we believe at Chicago—and never came back to Pictou County. That old engine should have remained in Canada, and should have been given as honorable a place as is given the "Rocket" in Barrow-in-Furness Station.

How many Canadians realize that the coal mines of Nova Scotia were supplying coal to Boston and New York and the "British Provinces" long before it was found that anthracite would burn, and before Pittsburg was.

It is interesting to recall that Sydney, N.S., narrowly escaped being called Pittsburg, which was the name proposed for it by Governor Desbarres.

RAILWAYS AS THE "ENTREPRENEUR" OF INDUSTRY.

Our British Columbia correspondent refers to the attention given by the President of the Canadian Pacific Railway to mines and industrial enterprises in his tour of the Western Provinces, and in doing so draws attention to one of the great functions that privately-owned railways have performed in Canada and in the United States. The Canadian Pacific Railway, we believe, has for some years maintained a Department of Natural Resources, which answers to a department that was formed in connection with some United States railways under an official known by various titles, but usually as Industrial Commissioner.

It was the business of this particular branch of railway enterprise to encourage the growth of industry along a given line of railway, to give publicity to suitable sites for factories, to spy out the land and make its possibilities widely known. While the primal incentive behind these departments was of course to create traffic and business for the railways interested, nevertheless the country in the vicinity of these enterprising railways was benefitted.

This function of a railway, so important in a new and growing country, with large undeveloped tracts within its borders, is one that can be better carried on by privately and corporately owned railways than by railways controlled and officered by Government officials, because, no matter how efficient the men appointed by a popular government, or how disinterested their motives, they cannot for long stave off the abuses of political patronage, of nepotism, of influence by populous and influential voting sections, and of the general tendency to ease in Zion that seems to descend upon all public utilities under electoral control.

The question of government control of railways versus corporate control is a live one in Canada and elsewhere today, and there are many sides to the question; but, as an *entrepreneur* of industry, we believe the government-owned railway will not prove successful, because it will not have behind it that paramount motive power of business, that primeval energiser of individual effort—personal and corporate profit. It is not fashionable in these days to express opinions in favour of monetary profits, but for what other incentive will the average man exert himself? Unrestrained individualism is responsible for many inhumanities, but in what other way has mankind found happiness but in honest work well done?—always (and here is where the average Canadian differs from the syndicalist, the communist, the Bolshevist, and all the other dreamers who wish to abolish toil, poverty and all grades of human effort, but whose finished work—if it were allowed to be accomplished—would be to degrade mankind to one drab and hopeless level of unremitting industrial slavery)—always, we repeat, for a consideration. That consideration may be larger or smaller, but if it is not forthcoming, the work will not be forthcoming either.

OIL CONCESSION CORRESPONDENCE.

In this issue of the JOURNAL will be found the text of a series of letters exchanged, first between the "Shell" Transport Company of London, and various members of the Canadian Government; and later, between the Federal Government and officers of the Provincial Government of Alberta.

In ensuing issues of the JOURNAL it is intended to publish the contents of letters exchanged between the Minister of the Interior at Ottawa, and the Toronto Branch of the Canadian Mining Institute, and further letters and telegrams exchanged between the Federal Government and the Alberta Government and oil companies already established and operating in Alberta and in Eastern Canada.

The correspondence is lengthy, but not tedious, and seeing that it concerns a request made to the Government of Canada for a reserve of 250,000 square miles of territory and a subsequent choice therefrom of 25,000 square miles, we believe it will interest most of our readers.

STORAGE BATTERY LOCOMOTIVES FOR MINING PURPOSES.

Present day labor conditions, accompanied by correspondingly high cost of unskilled labor, has made it imperative that mine managers consider the application of modern haulage machinery. In the past, mines with a limited output, and only moderate length of hauls could not give serious consideration to the heavy trolley type of locomotive, since their operations would not warrant such expenditure and it has therefore been necessary to resort to the primitive method of moving ore cars by hand. With the development of hydro-electric power throughout the Dominion, with its correspondingly low cost and flexibility, attention is

(Continued on Page 464.)

Nanaimo Meeting Western Branch, C.M.I.

(From our British Columbia Correspondent.)

A number of addresses dealing with mining matters of special interest in the Pacific Northwest, notable among which was one by Major A. W. Davies on "Tunneling at the Front"; the formation of a Coal Mining Section, the membership of which includes Vancouver Island and the Nicola Valley Coal Fields; and the election of officers were noteworthy events in connection with the annual meeting of the Western Branch of the Canadian Mining Institute held at Nanaimo, B.C., on June 4th and 5th. Some fifty delegates were present, all of whom were of Vancouver Island, with not more than three or four exceptions, this being explained by the fact that transportation facilities with the Mainland were dislocated by a strike of steamboat men. The Metalliferous Branch of the Industry also was marked by its lack of representation, although four of the addresses presented were of special interest to men of that section.

In the absence of R. H. Stewart, E.M., who is in Texas on professional business, W. M. Brewer, Government Mining Engineer, Nanaimo, B.C., occupied the chair. After his introductory remarks the election of officers for the new year was taken up with the following results:

Chairman, E. E. Campbell, Superintendent of Mines, Anyox, Granby Consolidated Mining & Smelting Co.; Vice-Chairman, Prof. J. M. Turnbull, of the University of British Columbia; Councillors, Wm. Fleet Robertson, Provincial Mineralogist; W. M. Archibald, Mine Manager, Canadian Consolidated Mining & Smelting Co.; Major R. W. Brock, University of British Columbia; Thos. Graham, General Superintendent of the Canadian Collieries (D), Ltd.; Major A. W. Davies, Superintendent of the Taylor Mines Co., which has taken over the Dolly Varden Mines, Alic Arm, B.C.; James Buchanan, of Trail, B.C.; A. G. Larsen, Spokane, Wn.; Charles Camsell, of the Geological Survey Branch, Ottawa, with headquarters at Vancouver, B.C.; Henry Lee, of the Britannia Mining Co.; R. R. Bruce, Paradise Mine, Windermere, B.C.; C. M. Campbell, Granby Consolidated Mining & Smelting Co.; A. G. Langley, Resident Mining Engineer, Revelstoke, B.C.

Coal Mining Section Formed.

The Coal Mining Section, to which reference has been made, then was proceeded with, and its organisation makes the third such body formed within the membership of the Canadian Mining Institute, the two others being in Nova Scotia and in Alberta and Eastern British Columbia, the latter being known as the Rocky Mountain Section. The idea is to give coal mine operators and miners an opportunity to devote independent and special attention to the problems relating to their industry. The officers selected for the Western Section follow: Chairman, George Wilkinson, Chief Inspector of Mines; Secretary and Editor, James Hargreaves, Instructor of Mine Work in connection with the Provincial Educational Dept.; Council: John Hunt, General Superintendent of the Canadian Western Fuel Company; Thos. Taylor, Pacific Coast Coal Mines, Ltd.; R. R. Wilson, Manager Granby Consolidated Coal Mining Company, Cassidy's; Francis Glover, Mine Manager, Princeton Coal Mining Co.; Charles Graham, District Superintendent Comox Colliery, Canadian Collieries (D), Ltd.

Eight papers were read, four at the afternoon and the same number at the evening session. The former are of interest to the metalliferous mining man, while the others deal with matters of particular concern to the coal miner. The latter are "Notes on Coal Mine Air Sampling," by Dudley Michel, Instructor in First Aid and Mine Rescue Work, Department of Mines; "Techincal Education and its Relation to Coal Mining," by James Hargreaves; "Regrading Slopes, No. 4 Mine, Cumberland, B.C.," by Charles Graham; and "Development and Operation of Mine Rescue Apparatus," by H. H. Sanderson, of Seattle, Wn.

An inspection of the coal mine plant of the Granby Consolidated Mining & Smelting by the delegates; a demonstration of the Gibbs and Paul Rescue Apparatus by teams representing the miners of Ladysmith and Nanaimo; and a smoking concert in the evening concluded the programme.

Chairman R. H. Stewart's Address (by proxy).

As I shall be, unfortunately, unable to be present at your meeting at Nanaimo and there are a number of matters which have been under discussion during the past few months which should be brought to your attention, I am forwarding this letter to your secretary with the request that he place it before the meeting.

The Council of the Canadian Mining Institute and the general meeting in Montreal have passed certain resolutions and proposed amendments to the by-laws of the Institute, which are now being referred to the members to be voted on, and for which you have doubtless received printed ballot forms. I refer to them in more detail below:

Amendments relating to the election of Council and Vice-Presidents.

This amendment is proposed in order that representation of the various provinces on the Council may be more evenly divided and that members elected to represent each province may be more truly representative of that province.

The present method of election is such that a councillor representing British Columbia is probably elected by the votes of members in Ontario or Quebec, most of whom may not even know him. The proposed method of election will make the councillors more truly representative of the Branches from which they come.

The Dominion is so large and the interests of the Provinces so varied that this arrangement seems very advisable.

Change of Name of the Institute.—The reasons for which this change is advocated are those which caused the change of name of the American Institute and the proposed change follows the lead of the American Institute. It is felt that the profession of metallurgy is so closely interwoven with that of mining, and members of both professions have so many interests in common that the Institute should embrace both, and as members of the metallurgical profession have in some instances felt that the C.M.I. was only a Mining Insti-

tute and that they were not mining engineers, they have not joined. The change of name is intended to make it clear that metallurgists are to be included.

Amendments re Membership Requirements.

It has been stated by certain members of the Engineering Institute of Canada that the C.M.I. was merely a trade organization and had no standing as a professional institute. While it is true that some of the members of the Institute are not engaged professionally in mining or metallurgy, the greater majority are so engaged and the amendments to the membership requirements have been designed to make this point more clear.

While the division between professional and ordinary members seems to be unnecessary and almost unfortunate, as there is no real distinction in so far as control of the actions of the Institute are concerned, both classes having the same rights and privileges; yet, in view of the remainder of the by-law, it would seem advisable that it be voted for in order that necessary changes be not delayed.

In view of the great extent of the Dominion and the differing interests of the various provinces, it is very advisable that the Provincial Branches be strengthened, and that they in turn be kept in closer touch with the parent Institute. Part of this is accomplished by the amendment to the by-law re. election of councillors. There remain other things to be done, and some of these have been under consideration by the Council.

Although the provinces are properly represented on the Council, distances are so great that it is impossible for Western Councillors to attend meeting at headquarters and matters can be passed only by Council meetings in Montreal, at which only eastern members are present. It would seem that outside of routine matters, all matters of general interest should be referred by letter or wire to all councillors for approval before being acted on and this if not already so, should be one of the by-laws of the Institute.

Besides the Council, there should be more definite connection between the Secretaries of the Institute and the Branch Secretaries and in a province like ours more definite connection between the Branch Secretary and the Branch Council and members. This, on account of distances between the Branch Councillors and members can only be accomplished by very considerable correspondence. It is necessary, therefore, that there should be a secretary who is paid by the Institute to give at least part of his time to this work. It is hardly fair to ask that a busy member give it voluntarily, and the thanks of the Branch are due to Mr. Wilkinson who has done so during the past year.

The council of the Institute have aproved the principle that the Secretaries of at least the Western Branches should be paid, and it is hardly necessary to point out to you the necessity and advantage to your branch of such a move. It is advisable that you send by wire to Montreal recommendations as to the amount to be paid and the name of the secretary who will be selected by the new Council.

The council of the Institute have approved the printion of paying the expenses of one member of the Council from each of the distant provinces to at least one meeting yearly at headquarters.

The above changes should be of great advantage to the Western Branch, but there remains much to be done to stimulate interest in the Western Branch.

It has been proposed that owing to the difficulty on account of the distances between the mining districts of the country, local branches be formed at important points, which will bring members in those districts together. Such branches are already in contemplation at Nelson and Nanaimo.

One of our active Kootenay members has suggested that in the Western Branch too little attention has been paid to the social side of our meetings. One of the main purposes served by the meetings is that of bringing members together and getting them acquainted. For this reason he believes that we should give more attention to this end of our meetings.

Some of the eastern branches hold informal monthly luncheons at which matters of interest may be discussed. Something of the kind might easily be organized in some of our B.C. centres.

A Committee of the American Institute has been formed for the purpose of further co-operation with the Canadian Institute and partly with this end in view it is proposed to hold a joint meeting of the Institutes at Nelson during the Convention there on June 19th—21st. It is to be hoped that many of the Western Branch members will be present.

It has been suggested that it would be possible to hold a general meeting of the Institute in the West once a year in addition to the Annual Meeting held in Montreal, which would enable western members to attend some of the general meetings of the Institute. This would appear to be feasible and of advantage to the Institute and its members. Would it be possible to hold such a meeting in Vancouver or Victoria, say about November 1st? This might be held jointly with Western Sections of the A.I.M.M.E. Your meeting might consider this question, and if thought advisable, make a recommendation regarding it to the Council of the Institute.

The Council of the Institute has made recommendations to the Dominion Government with regard to increasing the pay of technical men in Government service. It is well known that while the Government has very able technical men in its employ, notably in the Geological Survey and Department of Mines, the salaries paid are such that men are continually leaving them. No one can over-estimate the importance to the country of capable technical men in these departments or the necessity for their being properly paid. I believe your meeting will be prepared to endorse the recommendations of the Council.

A tentative scheme for the employment of returned soldiers in prospecting has been recommended to the Dominion Government. Details have not been worked out and probably had better be worked out by returned men themselves, amongst whom are many of our best prospectors, mineral and mining engineers. If such a scheme can be successfully organised and carried out, it might be of immense value to the province and to the Dominion at large.

In conclusion, you have my best wishes for a successful and interesting meeting and for a successful year for the Branch.

Vancouver International Mining Convention at Nelson.

The Vancouver Board of Trade will be represented by Messrs. Nichol Thompson, A. Erskine Smigh and Wm. Godfrey. The Vancouver Chamber of Mines by Messrs. A. M. Whiteside, Dr. Edwin T. Hodge, R. S. Lennie, Robt. C. Sweatt.

The Prospector and the Mineral Industry

By J. C. GWILLIM.

During the last year or so there has been some concern for the encouragement of prospecting in Canada. There has been a fear that unless prospecting is stimulated the mineral industry will decline. No new camps of great merit have been found in British Columbia for the last ten years. Some large producers, here and there, have become great mines, e.g., the Sullivan lead-silver-zinc mine of East Kootenay; the Britannia Copper Mine of Howe Sound; the Anyox Hidden Creek mines of Alice Arm; and the Surf Inlet gold mine of the same coast.

Within the last thirty years, 1888 to 1918, there have been several great impulses to prospecting, with the making of highly productive mining camps. In the order of their discovery, these are: The Sudbury copper-nickel deposits; The West Kootenay silver-lead, and gold-copper deposits; the Yukon placers, and the Cobalt and Porcupine silver and gold deposits. At the present time the districts of most promise are the pre-Cambrian areas of Northern Quebec, Northern Ontario, Northern Manitoba and Saskatchewan; all more or less wooded, rocky tracts of country intersected by water routes; and the flanks of the great coast granite batholith northwestwards from Vancouver.

There are still a good many prospectors, or adventurers of other kinds, who may chance upon a new mining camp. Prospectors breed fast after a chance discovery, such as the Murray mine outcrop of Sudbury; the Silver King of West Kootenay; the La Rose or McKinley-Darragh of Cobalt; and the Britannia of the British Columbia Coast. Not one of these camp makers was first found by a prospector of the vocational type. When, by chance, or by design, another camp maker is found, as it surely will be, there will be no lack of quickly appearing prospectors to search the adjacent and other districts. Some one may object to this variety of prospector, but a little enquiry will show that their winnings have been considerable, for prospector "aces" are uncommon; the life-long prospector may find less in any given time than one of these.

The mineral production of Canada, according to statistics, has increased from $12,518,894 in 1888 to $210,204,970 in 1918. Thirty years ago the metallic minerals produced were less than one-third of the total. Ten years ago metallic and non-metallic production was nearly equal, and in 1915 the metallics overtook the non-metallics, and structural materials. This was probably due to war demands; otherwise a great agricultural and industrial country is likely to produce a greater value of non-metallic minerals. During this period of thirty years the per capita production increased from $2.67 to about $25.00.

Prior to 1888, prospecting as a vocation was little followed in Canada, if we except the placer miners of British Columbia and a few casuals of Nova Scotia, Quebec and Ontario, who were searching for gold, copper, asbestos, rock phosphate, and nickel ores, in the back lots of these provinces. There was, however, a movement of prospectors along the north shore of the Great Lakes towards the silver area of Thunder Bay, and the gold occurrences of the Lake of the Woods.

Yet Canada, in its earliest history, was looked upon as a mineral country by those adventurers who examined the coasts of Newfoundland, Labrador, the islands of Hudson's Bay, and the north shores of the Great Lakes. I do not know the early history of gold discoveries in Nova Scotia or of copper and rock phosphate in Quebec; but the asbestos of Thetford, and the copper-nickel of Sudbury, were not discoveries made by vocational prospectors, and it is probable that the prospector of those days was a lumberman, a fisherman, trapper, hunter or backwoods settler, who did not wander far from his base in a direct search for minerals.

The more modern type of prospector appeared in Canada about 1885 to 1890, at a time when gold was coming from the Nova Scotia Anticlines, and the British Columbia placers of Cariboo, Omenica and Cassiar, in nearly equal quantities; silver from Port Arthur in Ontario, and from an unknown source in Quebec. Also in nearly equal quantities—195,580 ounces from Ontario and 149,388 ounces from Quebec. Copper then came almost entirely from Quebec, for Sudbury was only beginning its great production of copper-nickel. Lead, as now, came from British Columbia, but not from the Kootenay mines, for they were yet undiscovered. Pyrites had made a good start—63,479 tons in 1888. Rock phosphate was going strong in Quebec and Eastern Ontario. Manganese, in Nova Scotia and New Brunswick, was at its peak production, 1,801 tons. Zinc, cobalt and nickel, in 1888, were not produced in commercial quantities.

At this time Thetford asbestos and Sudbury nickel-copper fields were, so to speak, on the bottle—not known to be rare young giants—Rossland, Slocan, Boundary Creek, Klondike, Cobalt and Porcupine, were as Nature made them. These were not back lots, they were parts of the virgin wilderness; they were discovered more than less by luck and chance, but they were prospected by men who made a business of prospecting.

In 1889 the western mountains and coast contained many adventurous men, such as had followed the construction of the Great Northern and Canadian Pacific railways. There were also many who had followed mining or prospecting in the Western States—Montana, Colorado and Idaho.

When the Hall brothers, of Colville, on the Columbia, found the "Silver King" outcrop on Toad Mountain, near Nelson, while searching for lost horses, they started a prospecting movement which overran Southern British Columbia for the next ten years.

A year later, in 1890, Bourgeois and Morin staked on Rossland Red Mountain, and the following year Eli Carpenter came back to Ainsworth with high grade silver-lead ore from the Slocan. These, with discoveries of Boundary Creek, were all the beginnings of famous camps, which attracted "Mining Men" from many other fields, but chiefly from the Western Mining States; men who followed a mining boom as others follow a real estate boom. The country was alive with prospectors, promoters, mining experts and parasites, of a Western mining boom; mostly Western Americans at first. Sometimes a prospector staked and developed a "grass roots" property,

taking pay ore from the outcrop down; but the usual sequence of events was to option or bond the discovery to some mining man, who found the people who were ready to prove the property during a term of development. If things looked well, payments were made from time to time. Thus the prospector and the purchaser shared in the results of work done. This left the prospector free to follow his own line, or spend his payments, as he pleased, but kept him in the district watching developments.

The Western American method of bonding claims at a moderate figure, with payments as development warranted, has less risk than the cash payment for prospects. Often very large sums, made in Northern Ontario during the early days of Cobalt, Gowganda and Porcupine. Some of these won out in those districts, but they were great risks and a menace to good mining. Only good fortune was invoked when a large cash payment was made on pure prospects.

The prospector of the golden age in Southern British Columbia, was seldom a paid man. He went alone, or shared with partners, or was grub-staked for half share by someone who was ready to find him while in the hills and pay for his assays and other expenses on his return. The mountains were all crown lands; or if not he had the right of way, for British Columbia, mindful of its early gold hunting days, gives the prospector a pretty clear field. He can stake his ground in any direction and almost any place; but cannot overlap a prior location. Three stakes in a more or less straight line orient and define his boundaries.

The prospector of this period, 1889 to 1899, rarely made much but a living; some made fair "stakes," which were usually soon spent in the vicinity, not carried away and salted down. The great majority sold or bonded for small sums, worked in the mines when they were hard up, or got a grub-stake to carry on. The complexion of mining at this time was American. There were men from Butte, Spokane, Seattle, and the Coeur d'Alene of Idaho, with a scattering of Canadians from Alberta, where times were dull, and from the many drifters of British Columbia, who had wandered westwards and could go no further for the sea—an unstable element ready to follow new developments.

By 1898, much of Southern British Columbia had been run over by prospectors. No new camps were being found. The day of quick transfers was over. Production increased. Many went into the mines or clung to their pet claims; the rest were very ready for the great rush to Klondike in 1898 and 1899.

There was a ditty at this time in the minds of those who stayed behind to this effect:

"Kootenay was Kootenay when Klondike was a pup.
And Kootenay will be Kootenay still when Klondike's busted up."

The 30,000 men who went to Klondike in 1898 were a very mixed lot. Nothing much might be expected of most of them in the way of new discoveries; but there were many good prospectors also, some of whom traversed the country en route by way of the Edmonton, Ashcroft and Telegraph or Taku-Teslin trails. From all the host which traversed that north country and slowly filtered out again, much might have been expected, but the results were singularly small: a few small placer areas, and some lode mines at Windy Arm, Atlin, Wheaton River, White Horse, and White River. None of these, except the White Horse copper deposits, show much activity at the present time.

After a subsidence of British Columbia and Yukon booms, which had helped to bring the annual production up to $60,000,000, prospecting fell away. It was a period of prosperity and few men were adrift. Then, by another of those "Adventitious" discoveries in 1903, prospecting broke out afresh in a most unexpected place and Cobalt came to fame. All the rock cuts of British Columbia railways, as far as I know, never disclosed a valuable ore-body, or new camp, like the Murray mine outcrop west of Sudbury, or the La Rose of Cobalt. The Monarch Mine at Field and the Lanark, each of Revelstoke, may have been found during construction of the C. P. Ry.; but in other cases the railway followed the prospector, did not precede him.

Cobalt developed a different type of prospector. It is a country of low relief, woods, rocks, bogs, and water ways. To the Western man it had little romance; he was used to long views, and visible outcrops or float from them. The narrow streaks of ore; the covered surface; and the trenching for a discovery in the fly-plagued woods of Northern Ontario did not much attract him. Still, the reward in Cobalt camp, to the prospector, was unusual. One has to search for the men who made a stake and kept it in most camps; but Cobalt made a competency for many of its original prospectors, and their associates.

The Cobalt discoveries caused another long period of prospecting. There spread out into Northern Ontario and Quebec a host of adventurers, who found the lakes, rivers, woods and rocks as attractive and as hopeful as their Western brethren find the mountain. The canoe and tump-line became to them what the pack-horse and diamond-hitch is to the Western variety, and with these they have penetrated to many far away places. The names and stakes of some of them may be found along the edge of Labrador, 400 miles north of Quebec, and some are still searching pre-Cambrian areas, from Quebec to Churchill river, across the Northern portions of four provinces.

Porcupine gold camp is the latest of the great discoveries. Gold mining in Ontario had previously been disappointing. It needed courage to pay large cash sums for gold prospects; but it was done, and followed up by sufficient development, which has often proved the making of a mine. Otherwise Porcupine might have shared the fate of the earlier gold mining camps of Ontario. Since the discovery of Porcupine, there have been many new calls to the prospector, none of which, excepting, perhaps the "Pas" of Northern Saskatchewan, is a history maker. There have been some good ore-bodies found or developed in places far apart, without creating a prospecting boom.

The Portland Canal rush filled that country with prospectors, but did not make good at that time. Now it looks as if there might be a return to that and adjacent districts, caused by good results on Salmon river, Alice Arm, and the proved mineralization of rocks, associated with the coast range granite.

Considering, then, the record of new camps within the last thirty years, and the large areas yet potential, for such, it seems that other camps will appear, and the prospector wil not die out, for there are always masterless men, who prefer to follow luck, chance, and the wilderness to the restraint of other occupations.

Haileybury Mining School

Mr. Cody, Minister of Education, at Formal Opening.

At the formal opening of the Haileybury Mining School, held recently, Hon. H. J. Cody, Minister of Education for Ontario, made the definite offer to do all in his power to secure the necessary financial aid to make the School one of the most up-to-date and efficient institutions of its kind in Canada. With regard to the various courses in connection with mining, the Minister stated that in so far as the returned soldiers are concerned, if the School Board and all concerned with the welfare of the School will unite and successfully impress upon the Federal Government the importance of the work and thus induce the Dominion Government to pay the cost of personal maintenance, amounting to $70 or $80 per man, he made the definite offer that the balance of the expense, which would include the upkeep of the school and equipment, and the payment of salaries to the teaching staff, would be taken care of by the Department of Education of Ontario.

The chairman, George T. Smith, paid fitting tribute to the invaluable work of the advisory board, consisting of leading mining men of the Cobalt camp, namely, F. D. Reid, M. F. Fairlie and J. Deny, the first named being chairman. He also took occasion to refer to the unremitting efforts of the principal, W. A. Wilson, without whose efforts the school could not have achieved its present measure of success.

The first speaker was Capt. Thos. McGladery, who, as M.P.P. for this district, welcomed the Minister of Education to Tesimkaming. Capt. McGladery was folowed by N. J. MacAulay, Mayor of Haileybury, who drew attention to the fact that the present was not only the first visit of Hon. H. J. Cody to this part of Northern Ontario, but it was the first formal visit of any Minister of Education.

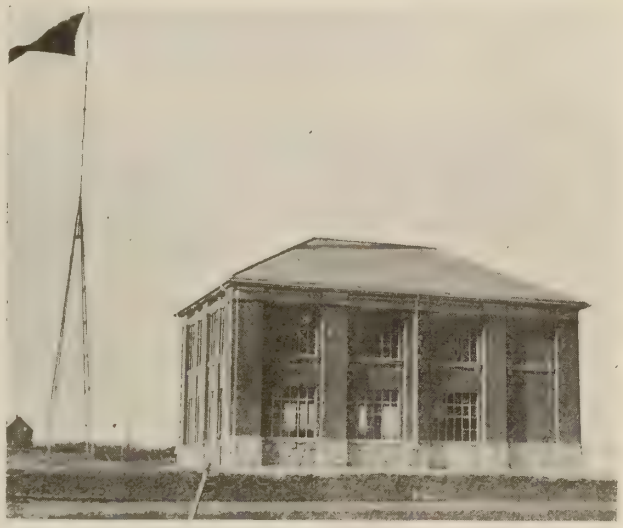
Hon. H. J. Cody's Address.

In opening his address, the Minister declared the Haileybury Mining School "well and truly opened," and stated that in so far as the school had been in operation some little time before this, his official visit, he was of opinion that the present was more in the nature of a benediction rather than an initiation.

The speaker referred to the fact that from this country had gone forward a body of men to fight a common enemy, and "whose suffering and service had purchased afresh this great heritage." He told of his previous impression of Northern Ontario being a wedge of rock extending away into the sub-Arctic, valuable alone for its great mineral wealth. The present visit, he said, had been a revelation, and that as he looked out over the vast sweep of territory, over the beauty of two million acres of agricultural lands, at the beauty and the fertility on surface and visioned the untold wealth below, the sight and the thought spelled out the magnitude of the North.

Optimism, said the Minister, appeared to be characteristic of every man in Northern Ontario. The discovery of the great silver mines of Cobalt a few years ago had marked the re-birth of Ontario, and, followed by the discovery of great gold mines further north and the gradual development of the wide sweep of agricultural lands had marked the north as the Greater Ontario. He referred briefly to a visit to the prairie provinces of the Canadian West when in their early stages of development, and in illustrating the spirit of optimism which held sway there at that time, he mentioned a visitor from the East having said that "Every knoll was a mountain, every rill a river, and every man a liar."

Hon. Dr. Cody touched briefly upon the present wave of industrial unrest, the necessity for patience and co-operation, and stated that it would be tragic for the wheels of Canadian commerce to be clogged at this time, by what in some instances looked like some malign influence at work. He told of the work of the Canadians in Europe, of how at the eleventh hour of the eleventh day of the eleventh month of 1918 the Canadian Corp had struck the final blow in the war in the capture of historic Mons, and that it would be a great pity to lessen the advantages of victory by lack of harmony.



Ore-testing Laboratory, Haileybury Mining School.

Haileybury's Fine Educational Record.

The Minister emphasized the supreme importance of education in a nation, of how the Haileybury Mining School was providing means whereby men could learn to specialize in a manner that would directly fit them for their life work, and that in this respect the North had led the way. The Haileybury High School started nine years ago, with a handful of pupils in a rented building. Six years ago the present school was started. And now, has come the addition of a mining department.

Comparing a secondary school of this nature with the Technical Colleges in other parts of the country, Hon. Dr. Cody declared: "I venture to think the kind of training here would fit the men for the particular work in much shorter time than in any other way."

J. A. McRAE.

SILVER OUTPUT—NORTHERN ONTARIO.

Estimate of 1919 Production.

The output of silver from the mines of Northern Ontario for the first half of 1919 has approximated 7,000,000 ounces. This would appear to indicate a total output of about 14,000,000 ounces for the whole year. So far during the year the price of silver has averaged about $1.03 per ounce. Since the removal of the fixed maximum price, however, a steady increase in quotations has taken place, and by the end of the year it would not be a surprise to metal authorities were the average for the year to amount to

abount $1.10 per ounce. Thus, with these figures as a basis of calculation, it would appear reasonable to expect the value of the 1919 production to amount to about $15,400,000. Compared with 1918 it would indicate a decline of about $2,000,000, but compared with 1916 would show an increase of over $2.000.000, and compared with 1911 would show an increase of upwards of $3,500,000.

During the fifteen years beginnig with 1904 and ending with 1918, the silver output amounted to $169,-241,387, or an annual average of $11,282,759. During the fifteen year period under review a total of 292,-056,976 ounces of silver was produced, or an average of about 19,470,564 ounces annually. Thus, although in point of ounces produced, the indicated 1919 output is considerably below the average, yet the increased price in quotations for the white metal makes the value of the output well above the average. With the probability of still further increases in the quotations for commercial bar-silver the Cobalt camp may be expected to hold its own for considerable time to come.

Following is a table which shows the average price of silver, the number of ounces of silver produced and the value of the output since the Cobalt camp came into being. The 1919 figures are obviously estimates:

	Av. price Cts. per Oz.	Ounces.	Value $.
1904	57.2	206,875	111,887
1905	60.4	2,451,356	1,360,508
1906	66.8	5,401,766	3,667,551
1907	67.5	10,023,311	6,155,391
1908	52.9	19,437,875	9,133,378
1909	51.5	25,897,825	12,461,576
1910	53.5	30,645,181	15,478,047
1911	53.3	31,507,791	15,953,847
1912	60.8	30,243,859	17,408,935
1913	57.8	29,681,975	16,553,981
1914	54.8	25,162,841	12,765,461
1915	49.69	24,746,534	12,135,816
1916	65.661	19,915,090	12,643,175
1917	81.417	19,401,893	16,131,013
1918	96.772	17,332,804	17,290,826
1919 (1st half)	103	7,000,000	7,210,000
Totals	.....	299,056,976	176,451,387

J. A. McRAE.

LABOR AND WAGES — KIRKLAND LAKE AND COBALT.

(From Our Northern Ontario Correspondent.)

After having learned that the members of the Miners' Union at Kirkland Lake called a strike without the sanction of the district executive, and after learning that one of the district officers had gone to Kirkland Lake for the purpose of endeavoring to bring about some sort of a settlement and induce the men to return to work, the journal correspondent took occasion to look into the situation carefully.

It is learned that the Union has addressed an appeal to the mine managers of Kirkland Lake, asking for another meeting on Thursday night, June 19. To this the mine managers have agreed. It is a peculiar fact, however, that even should the mine workers offer to return to work at the wages and on the conditions which formerly obtained, the mining companies are not prepared to take them back. The mine workers, they declare, were given every possible consideration, and were being paid wages that threatened the very existence of the gold mines of the camp, yet despite every effort to convince the men of this fact they proved untrustworthy to the companies for which they worked and demand that all men should cease work in those mines. Already a good deal of loss has resulted, and the mines having been forced to go to the expense of closing down, appear to have decided to remain closed for the summer and are confident that in the meantime the cost of producing gold will decline sufficiently to pay for the enforced idleness.

Mines Closing Down.

The Lake Shore, the leading producing gold mine in the Kirkland Lake camp during the past year, and paying interim dividends of about 2⅛ p.c. quarterly has not only closed down tight, but taken the pumps out and is letting the mine flood with water. Already the 400-ft. or lower level of the mine is said to be filled, the water having risen to within 375 feet of surface. The Tough-Oakes, the Wright-Hargreaves, Teck-Hughes, Kirkland Lake, Elliot-Kirkland, etc., have also all closed down with the intention of not opening until men may be employed at a rate that will leave a reasonable margin of profit to make it worth while to conduct mining operations.

In spite of this situation the union has asked for another conference and the mine managers have shown their usual courtesy in agreeing to meet the men in open discussion. However, as stated above, the mine managers consider the drastic action of the men as a breach of trust, and are not expected to again offer the same workers even the opportunity of re-employment, as it would again place the already heavily burdened gold mines at the mercy of the body which even now constitute the strikers.

Kirkland Lake Strikers Agitating Cobalt.

In the Cobalt camp quite a number of the most radical of the Kirkland Lake strikers have put in their appearance and appear to be endeavoring to enlist the sympathy and to incite the mine workers of Cobalt to strike in support of the action taken at Kirkland Lake. Meantime, as stated in Monday's "Globe," the Union here has agreed to not take any drastic action until Senator Robertson returns to Ottawa from Winnipeg.

Cobalt Managers Prepared to Close Mines.

The managers of the Cobalt mines have already made arrangements to close down should the demands of the union be pressed to the point of calling a strike. It is contended that wages are higher and conditions are equal to any other metal mining camp in the world. It is pointed out that in the Western United States wages have recently been reduced about $1 per shift. Also it is learned on good authority that in the Sudbury district a large number of miners are now actually out of work and seeking employment for only two or three days a week where or whenever possible. Were the Cobalt mines to close it is not improbable that curtailment would last until such time as new forces became obtainable, and that it might be found necessary to discontinue the payment of a bonus on the high price of silver at least until such time as the mines could recoup the loss incurred during the period of enforced idleness.

Under such conditions, therefore, and taking into consideration the fact that the suspension of precious-metal mining for a time would not cause more than local hardship, being in this respect different to coal mining, it would appear, after a careful review of the situation, that the Union will have everything to lose should they decide to strike.

Special Correspondence

NORTHERN ONTARIO.

Trethewey-Cobalt, Castle Property.

Shareholders of the Traethewey Cobalt Mining Company are enthusiastic over results being encountered on the Castle property in the Gowganda district. The shaft has reached a depth of 380 feet at the time of writing, and will be carried to the 400-ft. level where lateral work will be done for the purpose of opening up the vein system found at the 300-ft. level. The Castle property lies adjacent to the Miller Lake-O'Brien mine, and the geological conditions are very similar. This indicates excellent prospects for the Castle.

More courage is required to conduct mining operations in the Gowganda field than was the case in the early days of Cobalt, Porcupine and Kirkland Lake for the reason that even at the leading mine several year's work was done before encountering silver deposits of material of commercial value. The knowledge gathered as a result of the development of the Miller Lake-O'Brien mine, which is producing upwards of one million dollars a year, has made the exploration and the development of other neighboring properties less problematical, in that the geological structure has been proven to be less favorable for the deposition of silver in commercial quantities.

The terms under which the option is held gives the Trethewey stock in the Castle company in payment for money spent in developing the latter. This holds gold only up to a point where the Trethewey shall acquire fifty-one per cent. of the Castle stock. As to whether or not the remaining forty-nine per cent. is to be left in private hands or is held under option at some stated cash price has not been learned at the time of writing.

Beaver Lake—South Lorrain.

Properties situated in the South Lorrain silver area continue to attract attention. It is learned that British interests are now negotiating for the Beaver Lake property, situated adjacent to the old Keeley mine.

The Beaver Lake is owned by Messrs. J. M. Wood, Mr. Loney, Robert Jowsey, and Chas. Keeley, all of Toronto. Several years ago the property was explored in an aggressive way, a good deal of encouragement being met with. A considerable amount of low grade ore was opened up, and a number of veins uncovered in which a large amount of cobalt and encouraging silver values were found to occur.

New Uses for Cobalt Mineral.

It is understood that big interests are in the field, quietly endeavoring to secure mining properties in this district on which Cobalt minerals occurs in commercial quantities. It has been learned that "Stellite" (a high grade steel in the manufacture of which cobalt plays an important part is to be used extensively in the manufacture of automobiles in Great Britain. Not only has "Stellite" proved highly efficient in the manufacture of tool steel and in automobile construction, but it has been found to last indefinitely without tarnishing, and for this reason will probably be extensively used for purposes of decoration, replacing brass and nickel.

Much speculation is rife among certain of the mining men of the Cobalt district where cobalt mineral is found to occur in greater quantities than in any other part of the world. A few years ago its use appeared to be confined almost entirely to the china manufacturing industry in which it was used for coloring purposes. Should the use of the mineral really become extensive, added value will perhaps accrue to not a few of the silver mines of Cobalt, where, during the course of mining silver, a considerable amount of cobalt is mined. Also, a large number of outlying properties are known to have substantial deposits of cobalt.

Gold Occurrence Near Swastika.

A party of Dominion government geologists are engaged in field work in the townships of Eby and Otto, in the vicinity of Swastika, on the west side of the T. & N. O. Ry.

Recent prospect work in this area has resulted in the discovery of what has the appearance of being a possible important discovery of gold.

Catherine Gold Mines Co., Boston Creek.

The Catherine Gold Mines Company, Limited, a newly organized concern, has made arrangements to carry on comprehensive exploration and development campaign on property situated in the township of Catherine in the Boston Creek district. A force of men has already been engaged, the work of constructing camp buildings have been completed and surface trenching started.

Goldfields Consolidated—Larder Lake.

Diamond drilling is to be done on the Kerr-Addison property of the Goldfields Consolidated Company, in the Larder Lake area. According to official information the surface showings on the property are such as would offer every inducement to carry out an extensive exploration program with very satisfactory prospects of proving a large body of commercial ore.

A good deal of criticism is heard among mining men relative to the apparent failure of the Goldfields to venture an estimate as to how much commercial ore has been proven on their property, showing the number of tons and the average grade. In view of the fact that about three quarters of a million dollars has been spent on the property, it is thought a detailed report made out along the generally recognized lines would throw much light on the outlook. It has been pointed out that the Goldfields appears to be desirous of selling shares for the purpose of financing development work and that if average values are such as would indicate a big commercial proposition, then the quicker such a fact is advertised the sooner would the requisite finances be made available.

Clifton-Porcupine.

According to reports from the North the Clifton-Porcupine, owners of the Preston claim which adjoins the Dome Mines, is making good headway and meeting with excellent results.

In the early days of the camp a considerable quantity of commercial ore was produced from the property but financial backing appeared to be more or less limited and finally resulted in curtailment of work. The Clifton-Porcupine Company is understood to be well financed and is prepared to develop the property along important lines.

Leroy Lake Syndicate—Gowganda.

Surface work is well under way on the former Gowganda property of the Leroy Lake Syndicate, now under the control of eastern interests, with whom are associated Messrs. L. C. Campbell, and W. Fairburn, leaseholders of the Foster mine at Cobalt.

James Robertson, a former M.P. in the Province of New Brunswick, is understood to also be interested in the financing of the operation, having paid a visit to the property this week.

Dickson Creek—British Capital Available.

Arrangements are being made to resume underground operations at the Dickson Creek Mine, situated on the shore of Lake Temiskaming about half way between Haileybury and New Liskard. It is understood the head office in England has been permitted to release the finances required to operate the property along more or less extensive lines. During the course of the war, particularly in the closing stages, the British authorities took steps to discourage the sending of capital out of the country, with the result that mining properties in this country financed by British money were obliged to curtail operations. The release of finances for the Dickson Creek would appear to indicate that the restrictions have either been modified or relaxed.

Silver at Sixteen to One?

The utmost optimism prevails among the silver producers on the strength of the belief that a genuine movement is on foot in the United States to organize a league for the purpose of regulating the price of silver, and with a view to perhaps holding quotations at around $1.29 an ounce. The high grade deposits of silver in Cobalt make possible the realization of large profits at the present price of silver, and the manipulation of its market value to an equivalent of sixteen ounces of silver to one of gold will swell to a very considerable extent the margin of net profit. Whether or not this proposed league will actually come into being and prove as effective as calculated remains to be seen. Very recently it was intimated that an important announcement might be forthcoming early in July.

Personals—Northern Ontario.

David Fasken, president of the Nipissing Mine Company, has returned to Toronto after having paid a visit to the mine.

Mr. Haines, president of the Penn-Canadian mine is a business visitor in Cobalt this week.

Morgan R. Cartwright, manager of the Adanac mine is in Buffalo, attending the funeral of his father who died in that city this week.

BRITISH COLUMBIA.

THE NEED FOR A NATIONAL RESEARCH INSTITUTE.

Mr. Nichol Thompson, Chairman of the Mining Bureau of Vancouver, in supporting a resolution of the Board of Trade of Hamilton, Ontario, favoring the formation of a National Research Institute for Canada made some interesting references to the possibilities of the complete utilisation of the constituents of coal. Mr. Thompson's remarks were as follows:

I may say that I am heartily in accord with the spirit of the resolution; the enormous debt which we have incurred through the unfortunate war in which our Canadian boys have played such a conspicuous part, can only be redeemed by everyone in the first place practising the greatest thrift and conservation possible, for we have, as the letter states, in the past been one of the most wasteful of nations, and in the second place, there should be greater development of our natural industrial resources, and in order to secure this development and be able to meet other nations on anything like an equal footing, it will be absolutely necessary for us to devise ways and means through the work of men specially qualified to do research work in all the branches of industrial, commercial, agricultural and above all, human resources.

Canada, in establishing a National Research Institute, is only following the example set by other nations, who have taken to heart the lessons taught by the results of the late war. Great Britain, France, the United States and even Japan have set aside large appropriations of money for the promotion of chemical and scientific research.

Speaking on science and industry, Dr. Arthur Shuster, lecturing at the Regent Street Polytechnic in London a short time ago on pure science in relation to national life, said that the duty to work, the right to live, and the leisure to think were the three prime necessities of our existence. The prosecution of pure science was the search of knowledge for its own sake and the greater the industrial need, the greater must be the need for scientific research, for science was the organizer of common-sense. We look to science for a new outlook, which would have a primary influence on national life through its effect on the human mind.

Speaking at the annual meeting of the Silk Association of Great Britain and Ireland, at the Cannon Street Hotel a short time ago, Sir Henry Birchenough said that as a member of one of the committees created to deal with the trade problems of the war, he had been more than ever impressed with the necessity of better organization of the trade interests of the nation. Individual enterprise had its advantages no doubt in the past, but it had become too much of a fetish among us and when the rest of the nations were utilizing cartels and combines and othre organized efforts to regulate and advance the interests of their industries, it was time that we readjusted our methods to meet the changed situation, and instead of trusting to the old system of individual competition, we should co-ordinate individual effort by combination and organization.

The question of tariffs and government assistance were not new but they had ceased to be academic and were now issues of practical urgency.

Nothing had done more to bring this fact home to us than the discovery, which appeared to have amazed both the Government and the commercial community, that certain key industries, which many of our trades depended upon were practically in the control of the enemy.

Two lessons we had learned from the war. The first was that we must make ourselves absolutely independent of all foreign sources of supply of things upon which our national security depended, and the second was that we must be equally independent of the foreigner for the supply of things upon which the security of our industries depended.

At a dinner given to Premier Wm. Hughes of Australia in London, presided over by the Marquis of Londonderry, the object of which was to enable the Prime Minister of Australia to meet representatives of capital and labor in England, Mr. Hughes

said there had been general assent to the necessity for organization, but much confusion in the minds of many persons here and elsewhere as to what precisely is meant by "Organization." "The organization of which I speak," said Mr. Hughes, "is not a formula, nor a doctrine, nor an electioneering cry, but just the adoption of plain business-like methods to the circumstances of Britain, the Empire, and of every industry in it. It is national in scope, non-party in aspect, is not for the benefit of one class, but for all classes, for labor, for capital, for the nation, for the Empire. It is not a weapon from the armory of the faddist, to be used for tilting against windmills, but a flexible, convenient and effective instrument by which the welfare of the nation and that of every individual in it can be materially improved. What it does propose, is to utilize and develop the resources of the Empire, ensuring an adequate supply of raw materials for our industries, and to equip those industries, with the most up-to-date methods, so that regular and profitable employment for all available capital and labor will be assured, and wealth production per unit of labor and capital so greatly increased that we shall be able at once to carry the huge burdens imposed by this war, find employment for all our people, at good wages and decent conditions of labor, and enable Britain and the Empire to hold their own on their merits in the home and foreign market."

These are the sentiments of some of the foremost men of the Empire, and are germane to the subject of the Resolution which the Hamilton Board of Trade wishes this Board to support.

If time would permit I could give you many instances of prodigal waste in connection with many of our industries, but take one of our principal natural resources, that of caol. We import millions of gallons of crude oil every year at the expense of our coal industry, whereas if we were to adopt proper scientific methods, we could not only supply to a very great extent our own oil requirements, but also a valuable fertilizer, which we also import, and in addition would provide a smokeless fuel at a cost much below the present price of coal. Perhaps it is not generally known that our coals contain approximately 40 gallons of oil to the ton. They are higher in nitrogen than any other coal I know of and consequently high in the product of sulphate ammonia, one of the principal fertilizers.

Speaking of the shortage of petrol during the war, Mr. F. D. Marshall, president of the Institute of Gas Engineers, London, gave a concrete instance of the average results of two extreme types of coal which had been subjected to low temperature carbonization on a commercial scale. One, a poor coal classed as colliery refuse, worth about fifty cents per ton, the second a high grade Scotch canel coal rich in oils worth five dollars per ton.

Based on carbonizing these coals at the rate of only 200 tons per day or 72,000 tons per year, they obtained on the average of the two, the following products:

	Gallons.
Motor spirit (petrol)	260,000
Light oils	588,000
Middle oils	1,126,000
	Tons.
Bitumen	8,000
Sulphate ammonia	526

and in addition to this 44,000 tons of smokeless fuel or coke, practically gratis, as the yield of spirit oils and ammonia pays for the cost of the raw coal plus the cost of carbonizing, etc. The value of the spirits, oils and sulphate alone at the prevailing prices would be over £40,000 or approximately $200,000, but besides this the coke, if further gasified, will yield in addition to the quantity of 526 tons obtained by the preliminary carbonization of the coal, a further quantity 1,047 tons of sulphate of ammonia, making a total yield from the original coal of 1,573 tons of sulphate, and on this second process each ton of coke will yield on the average 121,000 feet of power gas, and every 70 cubic feet of this gas when consumed in a good gas engine, will develop what is termed one brake horse-power, so that from 44,000 tons of coke, which we obtain gratis, we get 75,000,000 brake horse-power on the aggregate for one year, which would equal approximately 7,000 brake horse-power per day free of cost. So you see if we were to deal with our coal rationally we could take from it the valuable volatile matter it contains in the form of spirits, oils and tar acids, and turn the resultant pure carbon or coke into power, which is the only sane way of dealing with this national standard asset, instead of allowing it to escape in huge volumes of black smoke poisoning the atmosphere, destroying vegetation and seriously affecting the health of the people.

The same is practically true of our smelters. We import sulphur from Japan for the manufacture of sulphuric acid for our powder works and also for use in our pulp mills, and thousands of tons of sulphur is belched into the atmosphere every year from our own copper smelters. Sulphur is the base of approximately all the alkalies such as washing soda bleaching powder, etc., which we ought not only to make for our own requirements, but have an ample surplus for export to the Orient, a market supplied from Europe and the United States.

These are some of the evils which this National Research Institute will assist to remedy and I hope this Board will strongly support its establishment by the Government of Canada .

INDUSTRIAL RE-TRAINING IN ONTARIO.

"Pensions are all very well but they will never stop the brooding and the bitterness of those who gave up their best energy forever, in the prime of their youth —you can't cure that with money; occupation and sense of usefulness will alone do it. To assure everyone of the chance of that, is the very least we can do for the men who have done so much for us."

John Galsworthy.

The fulfilling of this duty in Ontario is in the hands of the Department of Soldiers' Civil Re-Establishment through the Vocational Branch.

The work of this Branch begins in the Hospitals where the patients in the earlier stages of convalescence, are taught basket-weaving, wood carving, etc., and in the more advanced stages, in the Curative Workshops where carpentry, shoe-repairing and fifteen or more other subjects are taught. In addition to providing mental occupation these classes also tend to direct the man's mind towards earning his own living, when he is discharged from the hospital.

The Bedside and Ward Occupation are taught by Ward Aides trained for the Dominion by the University of Toronto in conjunction with the Branch and number over 250 to date.

On discharge from Hospital or Discharge Depot, if the Vocational Officer in the Hospital or Depot thinks

the man is eligible for retraining under Government Pay and Allowances, he is advised to report to the District Vocational Officer, Keen's Bldg., Toronto, or at any of the District Sub-Offices at Hamilton, Brantford, Kingston, Ottawa, Guelph St. Catharines or London, or at one of the Sub-Offices at Windsor or Stratford. Any disability incurred by service which renders it impossible for him to continue his pre-war occupation, constitutes eligibility for re-training.

At the above offices the man is interviewed by men who have been chosen on account of their understanding of human nature and of the soldier, and for their wide experience in business and industrial fields. From the Preliminary Interviewers, particulars as to the last Medical Board, the man's dependents, his education and industrial experience, are noted and placed with the fyle recording his progress in Vocational Classes in Hospital, etc.

He next appears before a board composed of two Vocational Officers and a Vocational Medical Adviser who endeavor to select a means of livelihood in which the applicant can compete with the normal worker.

In deciding a suitable course, the Board must give consideration to the following factors:—

What particular trend did the man's own wishes take in Hospital?

What is the best course considering the man's disability, prospects in suggested trade, and pre-war occupation?

What work can he be placed in and derive maximum value from his former civil experience?

Is there anything akin to his old job, when 100% efficiency can result from retraining?

Will it aggravate his disability?

For doubtful cases or those rejected by the Interviewers a hearing is given by the Advisory Board or Court of Appeal.

Courses of re-training have been arranged for in the University of Toronto, Vocational Classes and in Private Institutions, and the subjects to date total over 55.

In addition there are over 1,100 present being trained directly in Industries in Ontario. The "Industrial Survey" sub-branch locate firms willing to assist in the work, and after the man is placed, visit him weekly or oftener, making reports on the man's progress and conduct at work as well as on the opportunities offered by the Plants themselves. During this course of re-training on Government Pay and Allowances, the man is given any Medical treatment necessary, free of charge.

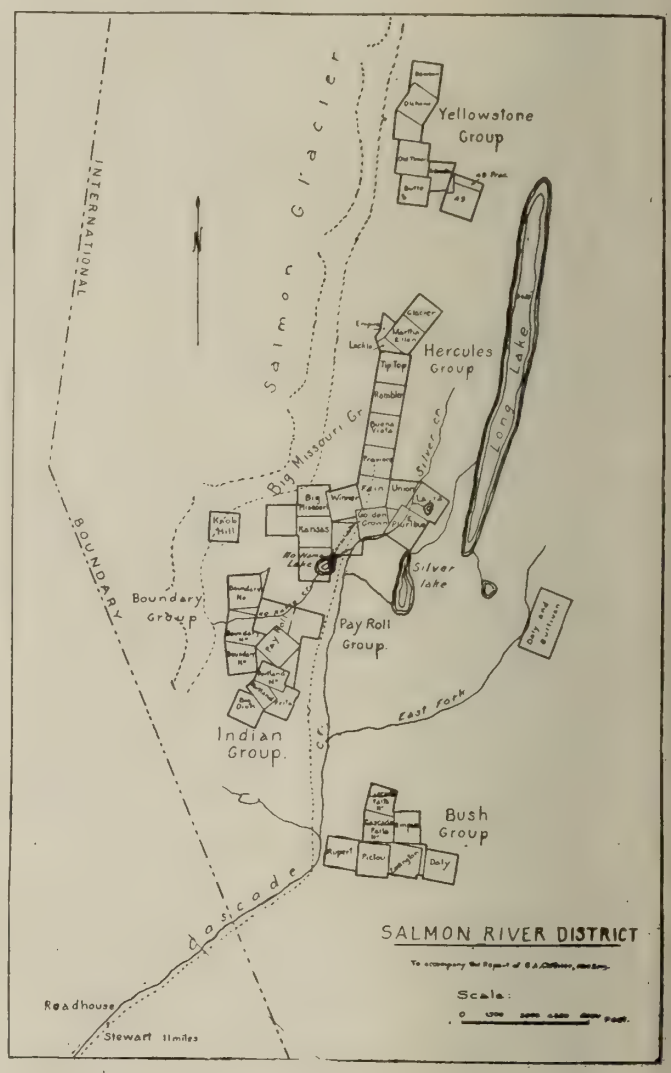
Three weeks before the completion of a course each man's case is referred to the "Information and Service" sub-branch of the Department for the purpose of finding him employment.

The "After-Care" sub-branch visits the home and occasionally the place of employment of the man after graduation from his course of re-training, and makes him feel he still has the Department's support and interest. When the graduate has four month's continuous employment it is deemed that he has "settled down" and visits cease, but not their interest and support, however.

In addition to the above sub-branches there are also the Administrative, Research, Medical, Reference and Literature, Supplies and Equipment, Records, Social Service, Adjustment and Claims, Accountants and Statistics.

SALMON RIVER, B.C.

We reproduce here a map of the Salmon River District, which will serve to illustrate that part of the Portland Canal Section, Northern British Columbia, which is at present attracting so much attention and where much development is expected this season. The sketch, which was prepared by George Clothier, Resident Mining Engineer, does not show several groups, notably that of the Bush Mines, Ltd. What was known as the Bush Property when Mr. Clothier examined the district is now the Premier Mine, shown on the map as the Bush Group. Another of the important properties not shown is the Mineral Hill Group which adjoins the Big Missouri Group on the east.



McKinley-Darragh.

Within the next few days the McKinley-Darragh will commence the exploration of the south-eastern part of its property, adjacent to the Nipissing. A cross-cut was driven into this section of the property some years ago, but the volume of work in other parts of the mine has required full attention in recent years, with the result that the proposed raising and exploration was not completed in the south-east corner.

A part of the area now about to be explored contains conglomerate formation and presents fair prospects of ore development.

The Oil Concession Correspondence

The Original Proposal.

July 30, 1917.

To Hon. W. J. Roche,
Minister of the Interior,

Territory Applied For.

Sir,—On behalf of "The 'Shell' Transport Company, Limited, of London, England, hereinafter referred to as "The Company," I beg to make application through Lieutenant-Colonel Adam T. Shillington, of Ottawa, for exclusive oil and natural gas rights for the period of the duration of the war and including five years after the declaration of Peace, over that part of the Province of Alberta lying north of the iffty-fifth degree of North latitude, and that part of the north-west territory of Canada bounded as follows:—On the south by the Northern boundary of the said Province of Alberta; on the East by a prolongation of the eastern boundary of said Province till it strikes the sixty-fifth degree of north laatitude; on the North along said sixty-fifth degree of latitude west to the Eastern boundary of the Province of British Columbia, thence South along said last mentioned Eastern boundary till it strikes a prolongation of the Northern boundary of the Province of Alberta and thence Eastwardly to the point of beginning, subject to the following conditions to be observed by the petitioner company and by the Government of Canada.

Concessions Already Granted.

1.—The exclusive rights so mentioned shall not in any way interfere with any rights already granted to any persons, firms or corporations within the boundaries above set out, but shall only apply to territory not yet conceded except in case of leases which may from time to time fall in or be cancelled.

Operation .

2.—The Company shall, if this concession is granted, begin and in a substantial way at the first open season after the date of such grant, and shall during the duration of the war, honestly and reasonably proceed with the exploration for oil and natural gas, and after the declaration of Peace the company shall measureably increase their efforts along these lines, and shall carry on the work in a measure proportionate to the magnitude of the territory comprised in the concession.

Rights of Way, Sites, Etc.

3.—The Company would require the free grant of rights of way over ungranted lands for all necessary pipe lines, telegraph and telephone lines, railways and highways and of land for the sites of reservoirs, storehouses and refineries or other factories to be established by them in connection with the exploitation of said oil fields, if any are found in said territory.

Customs Duties.

4.—The Company should be allowed to import, free of customs duties, any necessary machinery not manufactured in Canada, for the carrying on of the exploration and production of said oil and gas for the refinery of said oil.

Restrictions.

5.—The Provisions of the Government Regulations "for the disposal of petroleum and natural gas rights," so far as they may reasonably apply to and not be inconsistent with, or repugnant to, the terms of spirit of the agreement to be founded on this application shall apply:—

6.—It is a prime condition that for the duration of this agrement, after the proclamation of Peace, the this agreement, after the proclamation of Peace, the territory for oil and gas shall bear reasonable proportion to the scope of country assigned, or conceded, though for the previous period these efforts cannot be so large owing to the fact that many exports are not now available on account of the war.

Bonus.

7.—It is desirable that the present bonus on production of crude oil be continued to the Company so long as Canada imports more oil than it exports, and that the Royalty foreshadowed to be imposed after January 1st, 1930, shall not exceed, so far at least as the Company is concerned three (3) cents per barrel.

Tax Exemption.

8.—That during the time the Company's operations shall be within unorganized territory and for a period of fifteen years after such territory shall have been organized there shall be upon the company's property, or works, within said territory, no assessment levied by way of tax or impost.

Rents and Charges.

9.—No rental charges shall be made against the company for any land used by the Company for the purposes herein set out until the same shall be conveyed to the Company by lease nor shall they be chargeable for the wood or water used by them for the said purpose of exploration and production which may be taken from lands now in possession of the Government.

Hudson Bay Land Grants.

10.—Full regard should be paid to the Company's interests in the selection of such lands as the Government may be under obligation to withhold from the lease for the purposes of their agreements with the Hudson Bay Company.

Your Petitioner would set forth the following as some of the reasons why so large a concession in point of territory should be asked for by the Company.

Transport Facilities.

1.—The absolute absence of transport facilities in the territory covered and for hundreds of miles outside the territory necessitating the expenditure of an enormous amount of money in providing said transport facilities.

2.—Petroleum being a liquid and transport facilities when established being almost exclusively for carrying solids all the necessary equipment, even outside the territory has to be especially created, and owing to peculiar construction can only be used for carrying oil and are not of service for other products,

so that a large supply of oil must be produced in order to keep said special transport facilities profitably employed.

Difficulties of Operation.

3.—Owing to the severity of the winter season in Northern Alberta, and the adjacent territory it is practically impossible to carry on operations particularly as the transport in pipe lines, except at an initial expense which would be prohibitory, which necessitates immediate outlay for reservoirs and storage places for the product during that portion of the year when it is impossible owing to climatic conditions to transport the oil.

4.—These reasons which apply only to the territory covered by this application and not to Southern Alberta, where both transport facilities and climatic conditions are favorable to exploration and production by people of small means form insurmountable objections to the attempt to prospect and exploit on the part of anyone except a corporation of unusual financial strength or the Government itself.

Financial Strength of Applicants.

The market value of the stock of "The Shell Transport Company, Ltd.," exceeds one hundred and twenty million dollars, while the various capital stocks of its many subsidiary companies will in the aggregate amount to at least an equal amount, amply proving that the applicant company is financially quite equal to the burden. The business of the company, and its allied companies, is the production of oil, a business which they carry on in every known oil producing region in the whole world, and their experience in Russia, Dutch East Indies, Borneo, Mexico, California and Roumania, amply justifies the statement that no other British oil producing company has either equal wealth or experience in technical knowledge for the task.

The tremendous importance of oil as a fuel and as a power producer cannot be exaggerated, and when a company of known ability and standing is willing to risk its own money in such large measure in a country so difficult of access, even for exploration purposes, and so much more difficult for purposes of production, I would respectfully suggest that no possible criticism would come from any person on account of granting oil and gas rights over a territory that cannot possibly be even examined for a sufficient supply of oil except at so great an initial outlay as to prevent anyone except a Government or a great corporation from undertaking the task. The opening up of the country as proposed, if oil is found in paying quantities, provides that the present concessionaires will have without expenditure on their part transport facilities to enable them to market a product which, but for such facilities would be of no more use to them than so much water. The present scarcity of fuel oil and the many useful bye-products of oil teach us the importance of the possession of oil within the Imperial boundaries, and your petitioner humbly requests that the prayer of this application may be granted and agreements and undertakings based upon the same may be entered into between the Honourable, the Minister of the Interior, representing the Government of Canada, on the one part, and your petitioner, representing "The Shell Transport Company, Ltd.," on the other part, for the carrying out of the purposes set out in said application.

Your petitioner further ventures to point out that the large sums to be spent by this company by exploration, and the much larger sums to be spent in production of oil, if paying quantities shall be found as a result of such exploration, will be of inestimable value to Canada in opening up a vast region which is now an uncultivated waste.

Dated at Ottawa, July 31st, 1917.

(Sgd.) R. N. BENJAMIN,
(Sgd.) pp. ADAM T. SHILLINGTON,
his Attorney.

Mr. Meighen's Acknowledgment.

12th November, 1917.

Dear Colonel Shillington,—

Since taking over the Department of the Interior I have had brought to my attention the application you presented to my predecessor, the Hon. Dr. Roche, on behalf of The Shell Transport Company, Limited, of London, England, for certain rights and concessions in connection with petroleum in the Northern part of the Province of Alberta. I have carefully perused the application and am impressed with the importance of the scheme outlined therein. The matter will, however, have to stand in abeyance until after the General Elections, when I hope to give the application my most careful consideration, and as soon as a decision is arrived at I will communicate with you further.

Yours very truly,
A. MEIGHEN.

The Controller's Letter.

Department of the Interior,
Ottawa, 25th January, 1918.

Sir,—I beg to refer you to your letter dated the 30th of July last, addressed to the Minister, applying as attorney for R. N. Benjamin, on behalf of The Shell Transport Company, Limited, of London, England, for a reservation of the exclusive right to the petroleum and natural gas, the property of the Crown, in that portion of the Province of Alberta lying north of the 55th° of north latitude, and that part of the North-West Territories lying south of the 65th° of north latitude and west of the projection of the eastern boundary of the Province of Alberta. The application also included free rights of way and sites for reservoirs, refineries, etc.; freedom from custom duties; the present bonus on the production of crude oil; absence of impost tax for fifteen years after the organization of the territory; and free timber and water required in connection with operations.

In reply I beg to inform you that the application made by you, as attorney for Mr. Benjamin, has been under careful consideration, and it has been decided that the Department is not in a position to consider the reservation of the rights described in the application above referred to.

H. H. ROWATT,
Controller.

Lt.-Col. A. T. Shillington, M.D.,
281 Gilmour Street,

The Second Proposal.

122 Wellington Street,
Honourable Arthur Meighen,
Ottawa, May 3rd, 1918.

Dear Sir,—

On behalf of the Shell Transportation & Trading Co., Ltd., of London, England, I am enclosing you an application for prospecting rights over certain portions of Alberta and the N. W. T.

I do not know that it is necessary for me to say

anything in regard to the Shell Transportation & Trading Co., Ltd., as the Company is so well known in Great Britain. The activities of the Shell Co. extend to Russia, Roumania, Egypt, Borneo, Sarawak, Mexico, the United States, South America and elsewhere.

The Company was formed in 1897, being an amalgamation of tank, steamer and oil interests. I would be very pleased indeed to give you the fullest possible information in regard to the Company.

The following particulars will give you an idea of the volume of the Company's business. Dutch East Indies production during 1916, over 11,000 bbls.; Russia production during 1916, 10,000 bbls.; Roumania production 1916, eleven months, 2,500,000 bbls.; United States, exclusive of the State of California, production 1916, 4,684,000 bbls.; California production 1916, 4,809,403 bbls. Production in Mexico during 1916 was very large, but was intentionally curtailed by reason of export difficulties.

I would respectfully call your attention to the following reasons in favor of granting the Company the right to prospect over the area described in their application:—

1.—The absolute absence of transport facilities in the territory covered and for hundreds of miles outside the territory, necessitating the expenditure of an enormous amount of money in producing transport facilities.

2.—Petroleum being a liquid, and transport facilities when established being almost exclusively for carrying solids, all the necessary equipment even outside the territory has to be especially created, and owing to the peculiar construction can only be used for carrying oil, and are not of service for other products, so that a large supply of oil must be produced in order to keep special transport facilities profitably employed.

3.—Owing to the severity of the winter season in Northern Alberta and the adjacent territory, it is practically impossible to carry on operations, particularly transport in pipe lines, except at an initial expense which would be prohibitory, and necessitates immediate outlay for reservoirs and storage places for the product during that portion of the year when it is impossible owing to climatic conditions to transport the oil.

4.—These reasons, which apply only to the territory covered by this application, and not to Southern Alberta, where both transport facilities and climatic conditions are favorable to exploration and production by people of small means, form insurmountable objections to attempts to prospect and exploit on the part of anyone except a corporation of unusual financial strength or the Government itself.

5.—It is unnecessary for me to point out that the large sums to be spent by the Shell Company in explorations and the much larger sums to be spent in production of oil if paying quantities are found as result of such explorations, will be of inestimable value to Canada in opening up the vast regions which are now an uncultivated waste.

Kindly give this application your early consideration and oblige,

Yours very truly,
R. A. PRINGLE.

The Reply.

May 9th, 1918.

R. A. Pringle, Esq.,
Dear Mr. Pringle,—

I have your letter of May 3rd, enclosing applications for prospecting rights on behalf of the Shell Transportation and Trading Co., Ltd.

The concessions asked for in this application are such that the same could not be considered.

(Sgd.) ARTHUR MEIGHEN.

Request for Withdrawal of Second Proposal.

May 21, 1918.

Hon. Arthur Meighen,
Dear Mr. Meighen,—

Yours of the 9th instant in regard to application made on behalf of the Shell Transportation and Trading Co., Ltd., duly received.

In view of your decision that the concessions asked for are such that they could not be considered, acting under instructions from my client, I would ask to have the application withdrawn.

(Sgd.) R. A. PRINGLE.

The Application Returned.

22nd May, 1918.

Dear Mr. Pringle,—

I have to acknowledge the receipt of yours of the 21st, and not that you desire to withdraw the application made on behalf of the Shell Transportation and Trading Co., Ltd. I am returning the application herewith.

(Encl.)

ARTHUR MEIGHEN.

Sir Reginald MacLeod Asks for Interview With Sir Robert Borden.

8th July, 1918.

The Hon. Arthur Meighen, M.P.
Dear Sir,—

I have the honour to enclose copy of a letter I am forwarding to the Rt. Hon. Sir Robert Borden, and I shall be gratified if I may be favoured with an interview at an early date.

(Sgd.) REGINALD MacLEOD.

8th July, 1918.

The Rt. Hon. Sir Robert Borden, K.C.M.G.
London, W.C.
Dear Sir Robert Borden,—

You were good enough in April and May of last year to receive and consider certain communications from me on behalf of the "Shell" interests regarding exploration of territories in Western Canada.

You authorized the Hon. Robert Rogers, then in England, to discuss the matter with me, and as a result of several interviews with him and in compliance with his suggestion I forwarded on the 4th May, 1917, a general statement indicating the lines on which the "Shell" Group would be prepared to undertake the work of exploration and development, together with some reference to the position and experience of the Company.

It was then felt that negotiations could hardly proceed further in this country as Mr. Rogers could not conveniently enter into detail regarding a subject of such importance which lay under the control of another department of State. Moreover, his return to Canada rendered it necessary for further discussions to take place at Ottawa.

The Company then authorized Colonel A. T. Shillington to carry on these negotiations in Canada, and they learn from him that he has been in frequent communication wtih the Ministry of the Interior.

No decision has, however, been reached nor, it appears, can be reached until it has been decided as a matter of State policy whether the Government is desirous of entering into an agreement with the "Shell" Group, which would secure:

(1) for the Government skilled examination of territory, and skilled extraction of oil should such be discovered, all risks and charges being defrayed by the Company, and

(2) for the Company exclusive rights to selected portions of a sufficiently large area for a sufficient time to render their work effective and —if oil be found—successful.

The "Shell" Group in a point of resources, experience, and attained success over the world stands pre-eminent.

As a matter of special interest I would beg to point out that since my last communication the operations of the Company in Egypt have been greatly extended, and the Anglo-Egyptian Oil Company has now attained an assured position as owning one of the most important oil fields in the Empire.

Appended hereto are extracts from the Report of the Financial Adviser to the Government of Egypt, and there is also enclosed a copy of the Company's report just issued.

Sir Marcus Samuel, Chairman of the "Shell" Co., and his colleagues, would be gratified if the responsibility of seeking for, and, if found, of testing on a large scale, and in a scientific and comprehensive way the oil capacities of the area suggested in Western Canada were entrusted to them, and they would approach the problem with the firm intention of making research thorough and success—if success there be—large and enduring.

They feel, however, that the negotiations cannot be indefinitely prolonged.

The presence in this country of yourself, together with the Minister of the Interior, and the Prime Minister of the Province of Alberta—within the boundaries of which this territory mainly lies, and which is pre-eminently cnocerned in the success of the project under review—appears to offer a favourable opportunity of arriving at a decision on the main point —whether the Dominion and Provincial Governments view with favour the general proposition that a large area should be examined on scientific lines under the responsible management of the "Shell" group.

If this proposition be viewed with favour, perhaps Mr. Meighen would honour me and one of my colleagues on this Board with an interview leaving the arrangement of details for adjustment either here or in Canada.

I am taking the liberty of forwarding a copy of this letter to the Hon. Arthur Meighen and to the Hon. Charles Stewart.

(Sgd.) REGINALD MacLEOD.

Hon. Mr. Meighen's Reply.

9th July, 1919.

Dear Sir,—

I have your letter of the 8th instant, enclosing copy of communication of the same date addressed to our Prime Minister; also extracts from Note by the Acting Financial Adviser on the Budget of 1918. All of these I have read with care.

Several months ago a proposal was made on behalf of what is known as the "Shell" Group by Doctor Shillington, of Ottawa, Canada, to the Department of the Interior, over which I preside, looking to the securing of certain concessions for the purpose of oil exploitation in the Province of Alberta and the North. These proposals were of such a character that they could not for a moment be entertained. Later on, and shortly before I left Canada, the proposals were put in somewhat different form, but were still impossible of consideration. The Mines Branch of the Interior Department has regulations framed under the authority of Statute under which all operations in lands owned by the Dominion must be carried on. There are many companies operating under these regulations.

The Department would not be disposed to make special concessions in favour of any special concern or group, and could only consider any proposal along that line under the most special circumstances, and embodying the most adequate guarantees and return.

Unless the "Shell" people have definite proposals to make of a character very substantially different from those already presented, I do not think there would be any advantage in a discussion of the subject. If they have such proposals I would be glad to discuss the matter with you, and would suggest Saturday next, at 12 noon, at my rooms at the Savoy.

A. MEIGHEN.

London, W.C., July 10th, 1918.

My dear Meighen,—

Sir Reginald MacLeod suggests in his letter to me of the 8th instant (copy of which has been forwarded to you) that an interview between you and the Premier of Alberta will be desirable from his standpoint. Will you be good enough to give his request your best consideration.

Yours faithfully,
(Sgd.) R. L. BORDEN.

Hon. Arthur Meighen,
Savoy Hotel.

Memorandum Supplementing Interview.

London.
24th July, 1918.

The Hon. Arthur Meighen, M.P.,
Minister of the Interior of Canada,
Ottawa.

Dear Mr. Meighen,—

I trust by the time this letter reaches Ottawa you will have arrived safe at home.

I had hoped to have been in a position to send you the memorandum which you suggested as desirable to set forth at fuller length the observations by Mr. Benjamin on the occasion of our recent interview.

It has been impossible to complete this memorandum in view of the great stress of other business, and I write these few lines to tell you that the matter is being carefully dealt with with all reasonable speed and that we greatly hope to be able to forward it to you in the course of next week.

Yours very truly,
(Sgd.) REGINALD MacLEOD.

8th August, 1918.

The Hon. Arthur Meighen, M.P.
My dear Mr. Meighen,—

Mr. Benjamin and I have been seriously considering the kind suggestion you made at our recent interview that we should draw up a memorandum covering our recent conversation and the suggestions arising out of it for the entrustment to the "Shell" Group by the Dominion Government of the search for and, if found, the exploitation of oil in the Province of Alberta and neighbourhood.

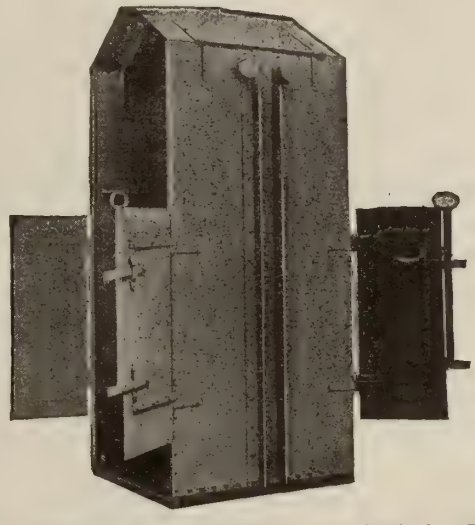
SAFETY MINE CAGES

MADE TO FIT YOUR SHAFT

We build these Cages to suit you and your workmen. They are Safe, Strong, and Reliable.

¶ The top doors permit the carrying of long timbers, or the escape of the men in case of accident.

¶ The hand rails are properly placed to safeguard the passengers in the quick ascent or descent.



¶ We supply these cages with either one or two sets of doors for inlet or exit, to suit your shaft.

¶ Rails are also laid in the floor, if required, for convenience in handling the cars.

MARSH ENGINEERING WORKS, LIMITED, Established 1846 **BELLEVILLE, ONTARIO, Canada**

Sales Agents: MUSSENS, LIMITED, Montreal, Toronto, Winnipeg and Vancouver

BRITISH COLUMBIA

The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, $75,116,103; Lode Gold, $93,717,974; Silver, $43,623,761; Lead, $39,366,144; Copper, $130,597,620; Other Metals (Zinc, Iron, etc.), $10,933,466; Coal and Coke, $174,313,658; Building Stone, Brick, Cement, etc., $27,902,381; making its Mineral Production to the end of 1917 show an

Aggregate Value of $595,571,107

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1895, inclusive. $94,547,241; for five years, 1896-1900, $57,605,967; for five years, 1901-1905, $96,509,968; for five years, 1906-1910, $125,534,474; for five years, 1911-1915, $142,072,603; for the year 1916, $42,290,462; for the year 1917, $37,010,392.

Production During last ten years, $296,044,925

Lode-mining has only been in progress for about twenty years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full information, together with Mining Reports and Maps, may be obtained gratis by addressing

THE HON. THE MINISTER OF MINES
VICTORIA, British Columbia

The suggestions are made in memorandum form, and are, of course, not intended for competition, but will obviously be available for such use as you may deem necessary in reference to your colleagues.

We are willing to fix, say, 5 years after the war, as the period within which 90 per cent of the territory shall be given back.

I shall be glad to hear that this outline meets with approval, and to have your suggestions for bringing the matter towards completion.

(Sgd.) REGINALD MacLEOD.

Memorandum with Regard to an Interview at the Savoy Hotel Granted by the Hon. Arthur Meighen To Sir Reginald MacLeod, and Mr. H. N. Benjamin, on the 13th July, 1918.

Sir Reginald MacLeod briefly opened the discussion referring to the letter he had received from the Hon. Arthur Meighen in which the latter had stated that the proposals put forward by Col. A. T. Shillington were unacceptable to the Ministry of the Interior in Canada, by reason of:

(a) the insufficient return and guarantee to the Dominion Government, and

(b) the large area asked for, while Mr. Meighen further stated that certain companies are working at considerable outlay under the existing mining laws without having obtained special conditions.

In the discussion that ensued Mr. Benjamin explained in general terms the reasons why geological exploration in an unproved country must take place over an extended area if a serious and economical exploitation is eventually to result.

Starting from the assumption that a serious deposit may probably be found in the Province of Alberta or in its neighbourhood, Mr. Benjamin proceeded to show how it was in the interest of the Dominion Government, on behalf of Canada and the Empire, that such deposit should be worked in a sound and economical manner and so as to obtain the best ultimate results in volume of production together with a duereturn to the Dominion Government and people.

Mr. Benjamin suggested a rough outline of a scheme by which the Dominion Government should entrust the search for a deposit and, if found, its eventual exploitation to the "Shell" Group on the basis that they should find the whole of the necessary funds by issue of preferred stock at a moderate rate of interest, the net profits of the venture being divided between the Dominion Government and the Group.

Mr. Meighen asked that the arguments on which the desire for an extended area were based and the proposal for association of partnership between the Government and the Group should be repeated in a communication addressed to him at Ottawa in such extended form as to give a comprehensive idea of the scheme.

Storage Battery Locomotive.

(Continued from Page 448.)

promptly directed to this source of energy utilized through the medium of the highly perfected, nondestructible Edison Storage Battery, since with batteries of this type as the source of energy, small, compact and efficient locomotives are now being used to solve haulage problems. The locomotives equipped with Edison storage batteries undoubtedly present the most practical and cheapest medium of haulage for the majority of cases, since they may be readily utilized under any existing mine conditions. The following information is supplied by Powley & Townsley, factory representatives.

The Crown Reserve Mining Company, Limited, Cobalt, are the first company in Ontario's silver district to install a small storage battery type of locomotive, and this year put into service a one and a half ton Automatic Transportation Company locomotive. This type of locomotive presents many unique features on account of its wide application where trolley types have heretofore been impractical. This small locomotive, operating on 18 in. gauge 12 lb. rails, and having a haulage capacity of 12 to 15 tons on the level, at a speed of five miles per hour, has proved to be one of the most profitable investments in this company's service and the work accomplished by this small locomotive is nothing short of marvellous. It is designed for direct spur gear drive on all four wheels, from a 48 volt motor, taking its current from a 40 cell type A-6 Edison Battery, having a 10.8 KWH capacity, which is sufficient to operate the locomotive continuously for a ten-hour shift. The locomotive is provided with detachable battery boxes and when mines operate two or three shifts per day, an extra set of batteries is provided, and at the end of the shift the discharged battery is removed as a unit and the re-charged one substituted, thus providing continuous operation.

The wheel base of this locomotive is 28 in. It readily negotiates curves of 7 ft. radius. Its overall length can be restricted to a minimum of 7 ft. with a width of 28in., thereby being especially adapted for use in drifts, and new developments, where narrow passages are encountered. The economy of this small locomotive can be reckoned, since the current consumed for battery charge is but 15 KWH, and in the majority of cases current does not exceed 2c per KWH, representing 30c per day for current.

One small unit of this type replaces on an average of six men, lessening congestion, since it travels at a much higher speed and reduces the number of ore cars required owing to the rapid transportation provided.

The batteries are automatically charged at idle periods. When in continuous service an extra battery is employed. This is all done automatically, current being supplied from a small Hertner constant current motor generator set. When direct current is available, batteries are likewise automatically charged through a special type of automatic rheostat and are disconnected from the line when fully charged, through the medium of a chargometer, which is mounted on locomotive.

The installation was made by Powley & Townsley. Excelsior Life Building, Toronto.

The Water Feed---The Big Thing

The quan ally TP Float Feed delivers the correct tity of water, and automatic- clears the bottom of the water tube by breaking away the slacked carbide, maintaining a bright, steady, workable size flame from start to finish of charge—you never need to rake or regulate an TP

To Manufacturers

Valuable economic minerals, of which the people of this country as a rule have little knowledge, are distributed in various sections served by the Canadian National Railways. The field of utility for these minerals is constantly expanding and entering more and more into the realm of manufacture.

Information on this subject can be obtained by writing:—

The Industrial and Resources Department Canadian National Railways
TORONTO :: ONTARIO

COMPRESSED AIR COAL-CUTTERS IN CANADIAN MINES.

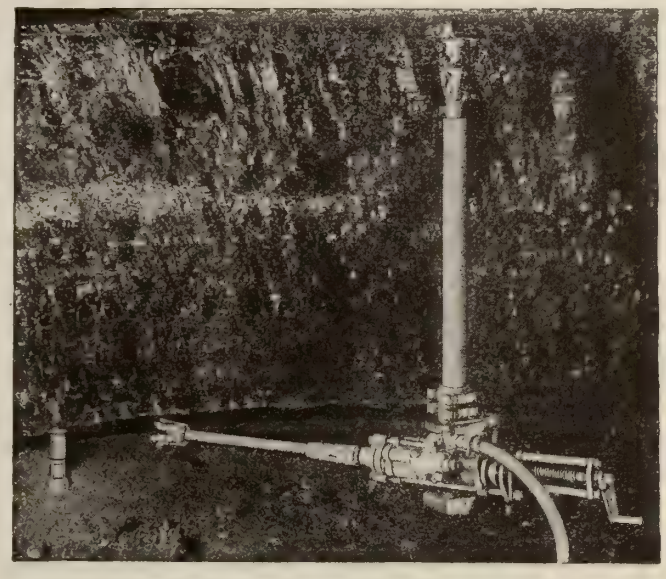
"Coal-cutters of the radial post type are coming into general use. These machines consist essentially of a percussive cutter of rock-drill type mounted on a column, fitted with a worm-gearing which enables the machines to cut either vertically or horizontally as desired. The radial machines do not impose so great a strain on the men operating them as do the "puncher" machines, moreover, they can be worked by comparatively unskilled men, whereas the successful operation of a puncher machine is a very specialized class of work."

This quotation from Bulletin No. 14 of the Mines Branch, Ottawa, written by the associate editor of "Canadian Mining Journal," Mr. F. W. Gray, gives a brief idea of the radial coal-cutter as used in Canadian coal fields. The radial coal-cutter, of which the "47," manufactured by the Canadian Ingersoll-Rand Company is an example, is practically a "piston-drill" on a special class of work, and for this reason the design of the radial coal-cutter differs in several particulars from that of the ordinary piston rock-drill, chiefly in connection with the valve. The chief work of the "47" Coal-cutter is for making cuts across the face of seams either horizontally or vertically. Where the machine is used for undercutting the column mounting is set up centrally in the "room," with the screw end next to the roof about 3½ or 4 ft. from the coal face. This allows plenty of room to manipulate the screw and to work the machine as close as possible to the bottom of the seam. By the worm crank the machine is swung back and forth, cutting a groove 2 inches deep on each swing. At the extremities of the undercut the groove is worked back to be square. The illustration shows this process very plainly, the screw at the top is shown, also the worm gear for swinging the radial coal-cutter.

One of the chief difficulties in coal-cutting is the occurrence of impurities such as sulphur in the coal. The radial coal-cutter will remove sulphur balls; these sometimes occur in bands 8 to 10 inches thick; the machine undercuts the lower 5 or 6 inches of this, and the remainder falls of its own weight or is easily barred down. The coal-cutter can also be used as an ordinary rock-drill for trimming or "brushing" entry rock walls.

A short description of the design of the "47" Coal-cutter may be of interest. The two principal features desired in the valve design of a radial coal-cutter are: A cushioned blow should the pick miss the coal, and an effective variable stroke. To secure these features the "47" uses a special form of valve with main and auxiliary valves. The auxiliary valve reverses when the piston has completed half its stroke, the main valve does not reverse till later. The main valve will reverse whether the piston completes its stroke or not, thus providing the variable stroke feature desired. If the pick misses the coal in the open end of the working the main valve will reverse in time to give the necessary cushioning effect. Still another feature of this valve mechanism is that the shorter the stroke the harder is the blow; this is useful in beginning a cut where the stroke is naturally short. The rotation is of the "release" type; with this type of rotation the ratchet is retaind by compression, and if the steel sticks the ratchet slips instead of breaking.

One difference between the radial coal-cutter is in the design of the drill bit. Instead of having a solid bit forged at the end of the drill steel as in the rock drill, the radial coal-cutter uses a special bit, in which are either three or five chisels; and these chisels can be removed independently for sharpening. The width of the cut is about five inches.



"47" Rand Radial Coal-Cutter.

The radial coal-cutter shows well on flat seams, but is particularly adapted for seams of 15 to 50 degrees pitch. Owing to the extreme variations in mine conditions it is impossible to give figures that will apply to very many mines. In Eastern Canada a great deal of the work is done by contract; that is, the miner is paid by the ton and pays his own help; this makes it difficult to secure accurate data on working. In one mine in Eastern Canada one "47" Radial Coal-cutter cut 12 rooms 20 ft. wide with 6 ft. depth of undercut in an eight hour shift. This is exceptional, but 100 tons per eight hour shift in normal working conditions, and 60 tons with adverse conditions can be expected with confidence.

The radial coal-cutter has the particular advantage of being readily portable; it is also not very expensive in first cost, and the repair cost of 300 coal-cutters in one of the Nova Scotia coalfields—came to $1.34 per machine per month, the results being taken for one year.

Optimism in Regard to Gold Outputs.

Having survived the period of war depression when labor could not be secured at any price, and when the cost of material was exorbitant and the delivery of supplies very unsatisfactory, the gold mines of Northern Ontario are now showing evidence of strength far greater than expected. The labor unrest which resulted in a strike at Kirkland Lake has been met with the utmost calm, and this newest of the productive gold camps appears to be content to perhaps wait until Fall before launching out into its full stride. In the Porcupine camp the utmost quiet appears to prevail in labor circles and it is thought that better judgment will hold sway. The coming Fall bids fair to witness every operating gold mine in Northern Ontario producing gold at full blast and bringing prosperity alike to the country, to the mine workers and to the country as a whole.

The Mines Branch maintains the following laboratories in which investigations are made with a view to assisting in the development of the general mining industries of Canada:—

Fuel Testing Laboratory.—Testing value of Canadian fuels for steam raising and production of power gas; analyses, and other chemical and physical examinations of solid, liquid and gaseous fuels are also made.

Ore-Dressing Laboratory.—Testing of Canadian ores and minerals, to ascertain most economical methods of treatment.

Chemical Laboratory.—Analysing and assaying of all mineral substances and their manufactured products. Copies of schedules of fees, which are slightly in excess of those charged by private practitioners, may be had on application.

Ceramic Laboratory.—Equipment is such that complete physical tests on clays and shale of the Dominion can be made, to determine their value from an economic standpoint.

Structural Materials Laboratory.—Experimental work on sands, cements and limes is also undertaken.

Applications for reports and particulars relative to having investigations made in the several laboratories should be addressed to The Director, Mines Branch, Department of Mines, Ottawa.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

Communications should be addressed to The Director, Geological Survey, Ottawa.

EDITORIAL

NEW LABORATORIES OF THE UNITED STATES BUREAU OF MINES.

The announcement that the new laboratories, and testing station for mine explosives, mine gases and coal dust, of the United States Bureau of Mines is to be formally opened and dedicated in September is of general interest, and, as representative of the mining industry of Canada, the JOURNAL congratulates the sister industry in the United States on having such facilities for research in matters relating to the operation of mines. While magnificent equipment is at the disposal of many universities, both in America and in Europe, we do not remember to have heard of provision of such excellence and magnitude at the expense of any other government as is available at Pittsburgh. Quite properly complaint was made before the Sankey Coal Commission in England by Dr. John Haldane of the miserably inadequate attempts that have been made to investigate the properties of mine air, the incidence of mine explosions, and matters relating to the safety of coal mines, such as stone-dusting and the testing of safety lamps, so far as these have been undertaken at Government expenses in Britain. In that country, the investigation of such matters has been left largely to private enterprise, and it is a matter for justifiable pride therefore in British circles that the investigation of the explosive properties of coal dust, the relation between mine air and the physiology of breathing, and other important achievements, owed so much to private investigators like Sir W. E. Garforth and Dr. Haldane, and that so much should have been done in the erection of laboratories and testing stations by personal and corporate benevolence.

One achievement upon which the United States Bureau of Mines is to be congratulated is the evolution of a practical type of breathing apparatus. It has always been apparent to those who were interested in breathing apparatus that each advertised type had its own peculiar excellences and its own peculiar defects, and that if some government controlled authority could by a process of combination of good points and elimination of defects experiment in the devising of a composite apparatus, a new and practical type of apparatus would be the result.

The coal wealth of the United States exceeds that of any other civilized nation, and it is eminently proper and fitting that its research equipment should be on a scale commensurate therewith. As Canadians are not envious, but we are ambitious, and trust that as our coal industry expands our research equipment may also keep pace. So far it has not done so.

"DECENTRALIZATION" IN THE COAL MINING INDUSTRY.

From an article in "Coal Industry" of Pittsburgh by George H. Cushing, we extract some conclusions of this competent authority on the coal trade in the United States as to tendencies in the mining industry. Mr. Cushing says:

> "The purchasing power of the coal users is going to be concentrated into a few hands which, when not offset by an equally centralized selling power, has a tendency to beat down the price of coal.
>
> "The essential force in production, labor, is being concentrated into a few hands. The power to negotiate the wage of labor is opposed by no equally centralized organization among the producers. This tends to advance the cost of production.
>
> "Also we have a proposal on the part of the government to control coal in order, thereby, to control the business which grows out of coal.
>
> "Every way the industry turns it faces solid opposition expressed in unit form. **Within the ranks of the mining industry we have remaining the same old decentralization.** One operator is pitted against another operator even in one district.
>
> "With the industry divided and sub-diivded into warring factions, we stand at every point confronting consolidated opposition. This, if continued, must end in nothing but the embarrassment, if not the destruction, of the industry itself."

Every sentence of Mr. Cushing's conclusions is as applicable to conditions in Canada as it is to those in the United States, and particularly applicable to Nova Scotia and the Crow's Nest and Fernie districts.

The Canadian National Railway Board has shown some scepticism as to the great increases which have taken place in the cost of coal production in Nova Scotia, and is inclined to use its centralized purchasing power to beat down the price of coal supplied from the Maritime Provinces.

The entry of the United Mine Workers of the America into control of the Nova Scotian coalfields centralizes the power of wage negotiation in no uncertain manner, and on the side of the coal-owners there exists no corresponding centralization.

The coal production in the month of June in Nova Scotia was, we have good reason to believe, the smallest since 1901. This is a matter of the gravest importance. June, of all months, is the one in which

the collieries should be producing large outputs, and production lost in June cannot be regained during the whole summer. With the smallest coal output for nigh on twenty years, with American coal coming into Montreal free of any competition from Nova Scotian coal, with a number of coal mines closed down, and others threatened with stoppage of work and foreclosure of mortgage, the miners' leaders are urging discussion of a six-hour working-day and a five days week. "Decentralization" is a mild term to apply to the internal conditions of the coal industry in Nova Scotia, and if continued, it must there, as in the United States, lead to "the embarrassment, if not the destruction, of the industry itself."

THE REPORT OF THE FUEL CONTROLLER.

The Final Report of the Fuel Controller of Canada is an interesting and thought provoking document. Mr. Magrath observes in his preface that the Report is divided into two parts, the first dealing with the fuel situation in Canada during the War, the second attempting to forecast fuel conditions of the future. Mr. Magrath further remarks that the first part is "merely of historical interest" except in the lessons it may convey and the light it may throw upon the fuel problems of the future.

In the dog days the discomforts of the "heatless Mondays" and the anxieties of the unusually severe winter of 1917-1918 may seem merely of historical interest, but we have a good deal to thank Mr. Magrath for. The unassuming and matter-of-fact recital of the activities of his Department, if carefully perused, will reveal many instances of the capable manner in which the Fuel Controller carried out the difficult task which was set him, and stands to the credit of Mr. Magrath and those who were responsible for his selection.

We reproduce in this issue the Fuel Controller's summary of the results achieved during the war period, which are sufficiently remarkable and explicit.

The section of the Report dealing with the future of the fuel problem in Canada is in reality an exhaustive monograph, dealing more intelligently and exhaustively with the fuel question than any previous attempt we recollect having come across. The geographical position of Canadian fuel resources in relation to the large centres of population is one of the peculiar problems of the Dominion. Appended to the Report is a diagrammatic map of the United States and Canada showing graphically the coal resources of each State of the Union and each Province of Canada. In studying this map one is immediately struck by the equable and generous distribution of coal in the United States, and by the tremendous disproportion between the coal resources of the Province of Alberta and the remainder of Canada. This map is worth more than reams of written explanation, and we would suggest that it be produced on thick paper or board suitable for wall reference.

If there is to-day any conflict between the industrial East and the agricultural West, we believe that a study of this map and a realization of its implications will show that before many generations are gone, the West will outrank the East in all that coal production means and carries with it. The opening sentence in the Fuel Controller's Report is: "Modern civilization has, in a large measure, been built on a foundation of coal."

The Report is reinforced by two papers by experts in the economic utilization of fuels, one by Warren S. Blauvelt, of Detroit, and the other by F. E. Lucas of Sydney, comment on which we will reserve for future issues.

Mr. Magrath, in relinquishing his office makes a number of suggestions for perpetuating and enlarging the work he has commenced, and it is to be hoped that his detailed recommendations, which have most evidently been given mature consideration, will be followed.

Whatever may be undertaken in this way, we believe that a perusal of the Report will show that Mr. Magrath has himself contributed material data towards the meeting of the fuel problem of the future.

The net cost of the Fuel Controller's organization from its inception in June, 1917, to its disbandment in March, 1919, is estimated at $114,000, and we think the people of Canada for once obtained full value for the expenditure.

STANDARDIZATION OF MINING PLANT AT FRENCH COLLIERIES.

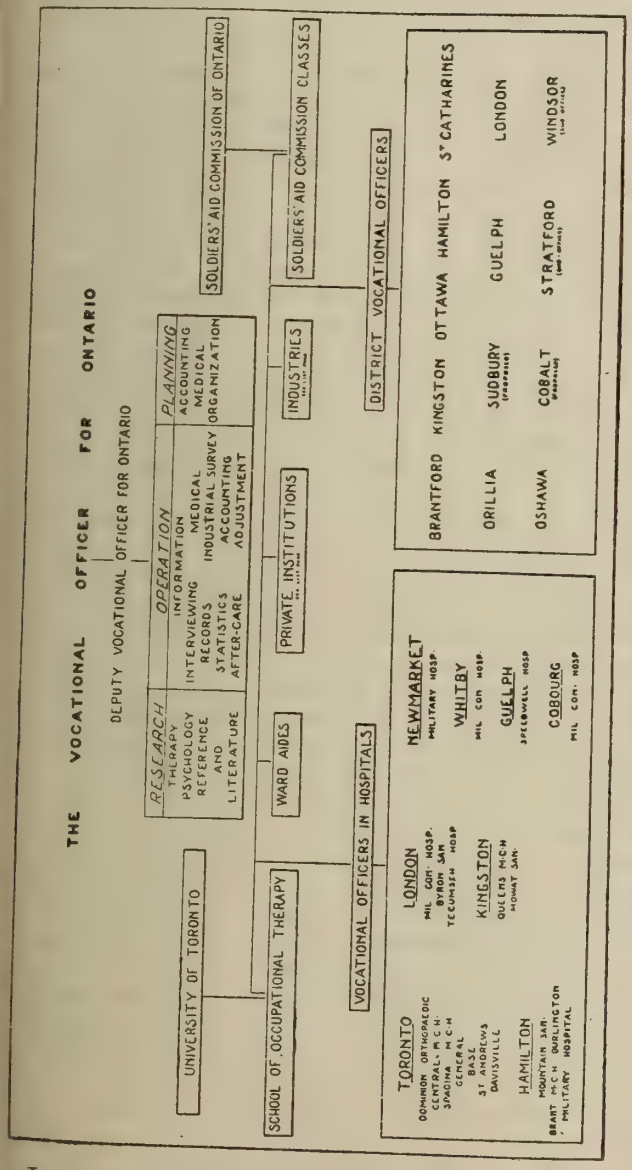
In France an effort is being made to profit by the opportunity afforded by the reconstruction of destroyed works to standardize all machinery, and especially mining plant. To this end a permanent commission has been appointed by the Ministry of Commerce.

The question of standardization has become a pressing one in all branches of industry, but in none more than in mining. There more than anywhere else the confusion due to want of uniformity is a hindrance to progress. The Central Committee of the Collieries of France has issued a circular calling attention to the need of uniformity, and gives a list of the things that should be standardized. This list includes nearly everything which goes to constitute a mining plant. The list has been submitted both to the users and to the makers of plant, with the request that they should consider the question and give their opinion thereon, so that an agreement may be speedily arrived at, and the work of standardizing taken in hand without unnecessary delay. The author of this paper is of opinion that it will be extremely difficult to arrive at an agreement which will meet the needs of all localities, and proposes a division into groups, with a standardization for each group, as a solution of the difficulty.—(Bulletin de la Societe de l'Industrie Minerale, First Issue, 1919.)

AUTO PRESENTED TO PROF. HAULTAIN.

Retiring Head of Vocational Work Honored by His Staff.

Toronto, June 19.—Five hundred members of Professor H. E. T. Haultain's vocational staff assembled at the Armories yesterday afternoon to present him with a touring car on the occasion of his retirement from the position of Vocational Officer for Ontario. The presentation was made the occasion of a striking tribute from those who had worked under the Professor and who expressed their keen regret that his active connection with the Ontario Vocational Branch of the Department of Soldiers' Civil Re-establishment had terminated. It was pointed out that over 92 per cent. of the male vocational staff in Ontario were returned officers and men, who had learned to look on the retiring chief as a personal friend.



Extent of the Organization Directed by Prof. Haultain.

In presenting the car on behalf of the members of the Ontario Vocational Branch, Mr. D. D. Eppes, head of the After-Care Department for Ontario, emphasized that Professor Haultain had earned the confidence of the disabled soldier and the respect and affection of his own subordinates. The speaker recalled that the retiring vocational officer had entered the re-training movement in its early days, and had seen it grow to its present day tremendous proportions. He paid tribute to the part the Professor had played in the development of the retraining movement, and lauded his sympathetic handling of the returned men. Professor Haultain, who was taken completely by surprise, accepted the presentation with a few suitable words.

The car is a very fine one—a McLaughlin Master 6, 45 h.p., Special, Special.

DEDICATION OF THE U. S. BUREAU OF MINES LABORATORIES.

The Bureau of Mines announces that during the week of Sept. 29 the new million dollar laboratories and workshops in Pittsburgh, Pa., will be formally dedicated. High officials of the Government, together with the Governors of the principal mining States and the leaders in the mining industries and miners' organizations, will be present to take part in the dedicatory ceremonies. A fetaure of the dedication will be a great national Safety-First meet, teams of miners from all over the country competing for cups and medals. There will be contests in rescue and in first aid to the injured, and as there is immense rivalry between the teams of the different mining companies, it is expected that these contests will take at least two days for decision. On Sept. 30 the elimination contests will begin at Forbes Field in Pittsburgh, and will continue until only the winning teams are left for the final championship contests, which will take place on Oct. 1 immediately after the elimination trials are completed.

The different laboratories of the bureau have been completely equipped for the investigation of the various problems relating not only to greater safety, but also to greater efficiency in the mining and metallurgical industries. Visitors will be invited to the electrical and mechanical workshops, and laboratories of the bureau and also to the petroleum, gas and coal laboratories, the testing gallery of the mine safety section, and the industrial gas-mask division. Another point of interest will be the experimental mine of the bureau at Bruceton, Pa., twelve miles from Pittsburgh, where an actual explosion of coal dust in the mine will be staged for the benefit of those attending. At the experiment station there is also to be shown a complete exhibit representing the mining and metallurgical industries of the country.

TRAIL SMELTING CHARGES — RECOMMENDATIONS OF COMMITTEE.

The Committee appointed to investigate the smelting charges of the Consolidated Mining & Smelting Co. at Trail, B.C., has reported to the Minister of Mines at Ottawa

The committee find that the application of schedule "B" has proved its general justification. It has brought about an improvement in the value and supply of ore, and a decrease in the cost of operation to such an extent that "the committee has felt warranted in asking the company now to act upon its undertaking to revise the existing schedule in favor of the producers of ore."

The committee suggests the appointment of a permanent committee, with functions similar to its own, to adjust future schedules.

Willet G. Miller and Canada's Mineral Resources

A United States Appreciation of Dr. Miller.

In "The Mining and Scientific Press," June 7th, there is published an interview granted by Dr. W. G. Miller, Provincial Geologist of Ontario. Mr. T. A. Rickard, who interviewed Dr. Miller, says editorially in the same journal:

"A short time ago we published an interview with Mr. Horace V. Winchell, a representative of the best type of American mining geologist; in this issue we give a similar interview with an equally worthy exponent of Canadian economic geology. Mr. Willet G. Miller is a stalwart Anglo-Celt, a big man physically and in character, a scion of the Viking breed, which has explored the far corners of the earth and carried the miner's pick in the vanguard of civilization. He is usually called Dr. Miller by reason of a double scholastic accolade, for he is a Doctor of Laws of Queen's University, where he taught, and also of Toronto University, his alma mater. He is one of those fortunate men whose services to the commonwealth have been recognized while they are still in the vigor of their manhood. Born in Canada of native-born parents, he typifies the traditions of a nation whose spirit was expressed with immortal eloquence during the War for Civilization. The interview tells the story of his life in a modest way. He would have said little if the interviewer had not cross-examined him with friendly persistence. His father had the tastes of a naturalist and from him he inherited the powers of observation which by academic training were developed into scientific research. While a student at college he early became a teacher also, the learning and the teaching being complementary and thereby fulfilling the true meaning of the word education—the drawing out of the mental faculties. His has been a fortunate career; early appreciated by his countrymen, he received an appointment, that of Provincial Geologist, for which he was well equipped, and then, by good luck, he had the chance of taking part in a mineral development of historic significance and industrial importance. Cobalt and Miller are names forever linked in honorable association. He appreciated the value of the discovery made in the course of cutting the grade for a railroad near Haileybury, in Ontario, and published a description of it almost immediately. The present writer, while editor of the 'Engineering & Mining Journal,' had the pleasure of printing that first account of the discovery at Cobalt in the issue of December 10, 1903. Although a cautious man—a trait inherited from his Scottish ancestors—Dr. Miller did not allow his scientific judgment to be stiffled; on the contrary, he came out boldly with the statement that "the ore is very rich, containing values in nickel, cobalt, silver, and arsenic; and a comparatively small vein could be worked at a handsome profit." In the 15 years since then Cobalt has produced 300 million ounces of silver. Dr. Miller has been amply justified in his forecast. He did more than that; he gave the miners in the Cobalt district a large measure of timely and practical geologic information; he did not wait until the mines were nearly worked out and then prepare a beautifully worded obituary notice or a highly scientific autopsy; he distributed technical data while he was collecting them in his official capacity and thereby gave to the exploration of the ore deposits an intelligent direction that ensured success. During the Cobalt boom, with its orgy of mine promotion and stock speculation, he did not lose his head nor endanger his integrity. While others became millionaires by following the advice he gave officially, he remained true to his duty. He might have enriched himself greatly, for he received many tempting offers to resign his appointment and accept both handsome retainers and profitable participation in attractive enterprises. It was all to no purpose; he loved his work and stuck to his post. His classification of the Cobalt rocks still holds good. From the start he expressed a preference for the silver veins in the conglomerate as distinguished from those in the schist and diabase; he also predicted that in passing from the Huronian conglomerate into the Keewatin schist the veins would probably become impoverished. These opinions have been confirmed by mining. Therefore our readers will note with keen interest his references to the unprospected regions of Canada. We publish a map in order to give additional point to his important statement. Experience, in Ontario particularly, has shown that the pre-Cambrian rocks constitute a terrain favorable to deposits not only of the precious metals but also copper and nickel. There is an enormous area of such rocks in Canada, particularly in the north and north-east. We desire to draw special attention to Dr. Miller's observations concerning the Hudson's Bay territory, which will be rendered accessible shortly by means of the railroad now under construction from the main line of the Canadian Pacific railway to Port Nelson. In these spacious sub-Arctic regions there remains, as Dr. Miller says, the most attractive unprospected area in the world. It is comparatively free from brush or forest and therefore open to exploration. We shall publish further information on the subject at an early date. At present the Sudbury ore deposits dominate the nickel market, but the chance exists that somewhere in this pre-Cambrian shield of the North there may be found other nickel lodes of comparable richness. The part that the Canadian nickel resources played in the War is well known, and it is noteworthy that Dr. Miller was foremost in organizing those resources for the use of the Allies. He gives expression to the international goodwill now sealed by comradeship in arms; indeed the unfortified boundary separating Canada from the United States is an outward and visible sign of a peaceful policy more eloquent than any Hague convention or Paris conference. If the rest of the world were as amiably disposed as the members of the mining profession in the two English-speaking countries of North America there would be no anxiety as to the maintenance of international amity. They are exchanging knowledge and co-operating in beneficent industry with the most hearty accord, and in this respect such engineers as Dr. Miller and Mr. Winchell are typical. The joint committee appointed recently by the Canadian and American mining institutes should serve further to promote good feeling, by taking prompt steps to remove any minor points of disagreement arising more particularly from the barbed-wire entanglements of tariffs and custom laws. One thing is sure, any American engineer going to Ontario will find Dr. Miller, Mr. Thomas W. Gibson, Mr. Reg-

inald W. Brock, and other men of their kind, only too glad to welcome them and to express their welcome by giving all the geologic information available. They may find the tall Doctor a bit reserved and non-commital at first, but when the crust of reserve has melted, they will find an inextinguishable warmth coming from a heart as big as his broad chest. Fertile in ideas, capable of wide generalizations, a good judge of human nature, shrewd but kindly, they will find a man neither easily deceived nor ever willing to deceive. His long legs are as much at home in the primeval bush as they are under the thwarts of a canoe; whether in the field or in the council-chamber, he is a born leader of men, and one whose leadership is accepted gladly. Alike as chief of an exploring party in the wilderness and as president of the Canadian Mining Institute in the city, he has won the confidence and affection of his fellows. Sentiment he has and the sense of humor, but most of all a willingness to help others. That characteristic has been evident throughout his life in Ontario, whether as student or teacher, geologist or official. He has trained a number of young men now honorably prominent in Canadian geology; he started them on careers of acknowledged usefulness. Honors have come to him, academic and professional, but no honor counts so greatly as the affectionate regard of the young men to whom he has given a helping hand. By his friends you shall judge him."

Final Report of the Fuel Controller

In viewing any results which the Fuel Control Organization may have been able to accomplish, the fact should not be lost sight of that the work was undertaken at a time when the country was passing through the greatest crisis in history, and financial, commercial and political conditions were in a state of flux. Concurrently with this trying situation, like a bolt from the blue came the winter of 1917-18 which has passed into history as one of the worst in severity with which the coal operators and transportation systems on this continent ever had to contend. The Fuel Control organization having been suddenly called upon to face such an emergency, was also handicapped in dealing with the situation by a lack of adequate data regarding the distribution and consumption of coal in Canada.

Notwithstanding these and other adverse conditions, Canada's importation of anthracite for the coal year ending March 31, 1918, was 600,000 tons in excess of any other year; while the importation of bituminous coal exceeded that of the previous coal year by 4,000,000 tons. After three years of war, Canada had reached its maximum effort: hence the need for these excess tonnages was imperative and fully recognized as such by the United States Fuel Administration.

The efforts of the country to obtain its supplies from the United States, in the second year of the Fuel Control organization, were proceeding very satisfactorily up to the time the armistice was signed in November, 1918. At the end of that month, the imports of anthracite from the commencement of the coal year, April 1, were 177,414 gross tons in excess of the tonnage received for the same period in 1916, the year adopted by the United States Fuel Administration as the anthracite basic coal year, while the imports of bituminous were 3,371,243 net tons in excess of the tonnage received for the same period in 1916. With the conclusion of the war, and the closing of war industries, in the middle of December, the outlook had changed completely, and an abnormally mild winter finally disposed of "the coal situation."

The annual production of coal in net tons within Canada during each calendar year in the period of the war was as follows:

1914	13,637,529
1915	13,267,023
1916	14,483,395
1917	14,046,759
1918	14,979,213

Not only was the tonnage of coal secured from all sources sufficient to meet the needs of the country as a whole, but also, its distribution was effected in such a way as to provide adequately for individual requirements. In fact, although Canada has on the whole an extremely cold winter climate, it is safe to state that in no country with similar fuel requirements was there as little suffering or inconvenience during the war period, as in this country. Taking into consideration the distances separating the consuming areas in Canada from the mine fields, and the cost of production in Canadian mines, the prices of coal compared favorably with those in other countries.

Prices of coal, whether of foreign or domestic origin, under the coal regulations were fixed on a basis of actual cost plus a reasonable net profit. The following table shows the great expansion in Canadian Export trade during the period of the war annually for fiscal years ending March 31, in:—

1913	$ 393,232,057
1914	478,997,928
1915	490,808,877
1916	882,872,502
1917	1,375,758,148
1918	1,589,661,195

A reference to the report on "The coal trade of Canada," just published by the Dominion Bureau of Statistics, will show that Canada's consumption of coal has not kept pace with this industrial expansion, which points to the conclusion that Canadian manufacturers have been obtaining greater efficiency out of their coal, as well as making greater use of the country's water powers.

In conformity with the policy of statistical co-ordination, recently adopted by the Government, the statistical data of the Fuel Control organization, bearing on the production, importation, and distribution of coal, at the termination of Fuel Control on the 31st of March, 1919, is to be turned over to the Fuel Section of the Dominion Bureau of Statistics. These data will form the nucleus for further investigations, and should occasion require, an amplification of the work can be undertaken at short notice. The statistical material covering the coal year ending March 31, 1918, is being published by the Bureau in a report headed, "The Coal Trade of Canada," which it is hoped will be followed by annual reports of a similar nature.

The Oil Concession Correspondence

(Continued from issue of June 25, 1919.)

Memorandum Extending Interview With Hon. Arthur Meighen.

The first question is whether it is in the best interests of a great country having important potential oil deposits to give licenses to a multitude of small enterprises to exploit sections here and there, and to sink wells wherever some indication of the presence of oil is found; or to undertake, under competent management, search for and exploitation of oil-deposits over a very wide area their main sources being traced and the oil being extracted, refined and brought to market under an economical and conservative system.

In searching for a deposit of petroleum under lands which have not already been submitted to the drill it must be borne in mind that as the location of the main deposit may be at a depth below the surface of a quarter of a mile a search for outcrops and other indications is required at very serious distances apart, a process which calls for a number of surveyors and geologists to record and locate various indications, and for an extended time in which to make the search as well as to correlate the facts observed and deduce therefrom the probable location of the deposit.

The object of such an examination is not to find oil in comparatively small quantities, but to locate the main anticlinal or backbone of the deposit and to find out from surface and other indications where the deposit is within reach of a drill hole and where it sinks to an unreachable depth.

The working of a subsidiary anticlinal is wasteful and entails, if due care be not taken, the danger of the swamping with water of a larger area.

Dealing with a liquid which calls for the special creation of the facilities for raising, storing and transporting it, is entirely different from dealing with a solid, the storing and transporting facilities for which are already in existence and are exchangeable as between solids. This detrimental quality of a liquid requires an estimate of quantities to be handled to be made in advance of the creation of the facilities, otherwise the wastage of capital is enormous.

The supply obtained from wells is an irregular, but constantly decreasing quantity, so that even when sufficient oil is obtained to place the venture on a working basis continued research is needed to follow the extension of the field and secure maintenance of the output without which the large expenditure required for transport, treatment and distribution is unwarranted.

Oil ventures may be divided into two classes, namely, those which are conducted on a small scale and those which have higher ambitions with the hope of finding a sufficiency to supply, firstly the local demand, and should there be an excess, to create an export trade for the benefit of the country owning the fields. It is with this larger purpose in view that the "Shell" Group would propose to proceed. It is obvious that the geographical position of the Alberta fields would call for very large expenditure, which should production in their opinion warrant it, would be cared for by the "Shell" Group.

A comparison may here be drawn from actual experience between undertakings aiming at a business on a large scale which must naturally really have sufficient area at its disposal to warrant the necessary disbursement and the wasteful and damaging method of confiding the exploitation of small areas to numerous parties.

A glance at the maps of California, Roumania, Pennsylvania, Texas and elsewhere showing the division of fields, into small lots and the location of the boreholes thereon will forcibly bring home the following conclusions:—

Where this system prevails the number of boreholes put down is grossly excessive, each owner endeavouring by placing his boreholes as near as the law will allow to the boundary line, to draw oil from his neighbour's territory, with the result that from 10|20 times the number of boreholes no more, and possibly considerably less oil, is gathered than would be obtained from a smaller number of holes scientifically placed on previously ascertained geological information.

It can be no part of the policy of the Dominion Government to foster the excessive cost of bringing to the surface a deposit which is a national asset if properly worked.

Apart from the excessive cost of production thus entailed bankruptcy and ruin to thousands of people may result from the gross speculation which arises when a presumptive oilfield is first located. The oil boom in Texas is an example of this trouble, while it has been repeated in Galicia, Roumania, elsewhere in the United States and in other countries.

In 1901, when the Lucas well was struck in the neighbourhood of Spindletop, Texas, speculators acquired rights on plots which were divided up into infinitesimal lots, and some hundreds of companies were formed for the working of single wells or areas only sufficiently large to take a very small number of wells.

Perhaps 80 or 90 per cent. of these companies were pure swindles, entailing ruin to those who invested in them. After a year or two the surviving companies fattened on the losses of those which have gone under, and this procedure has been followed elsewhere. Looked at from the point of view that an oil deposit is a national asset, it is deplorable to consider the waste of petroleum which results from this sub-division and working of the lands. Undoubtedly a large deposit of oil was found in Texas and gigantic quantities were brought to the surface within a few months, quantities which were far in excess of the reasonable demand, resulting in the value of the oil at one time falling to 2 cents or even 1 cent per barrel, while enormous quantities, values being so low, were allowed to run to waste.

Had such a deposit been in the hands of a large and responsible company capable of properly working it the oil would have been brought to the surface so as to emit reasonable requirements, and the production consequently spread over a number of years.

As it happened the wastage of capital cost and the wastage of the product obtained were almost criminal, while by reason of careless or inexperienced drilling the quantity left in the ground and probably

yet unobtainable, is a larger percentage than it should be.

Scientific work means the obtaining of the largest possible percentage of the deposits for human use whereas unscientific work fails to obtain so large a percentage of the actual deposit.

It may be urged that granting the necessity for search over a larger area the area required for eventual exploitation ought to be much smaller.

The area required for search should be the largest possible, but will be reduced by stages.

Geological indications referred to above will be utilized merely as facts from which to deduce the location of a deposit, and the large majority of these indications will be found where the territory would be valueless for drilling purposes.

After arriving at a rough idea of the location of the main deposit certain areas would be marked for more detailed geological investigation, and the balance would be no longer required. This extended geological examination would again lead to the giving up of further portions, and these smaller portions only would be retained for the purpose of exploitation, and would be confined to those grounds where the mineral rights are still retained by Government.

As an instance of this procedure an area of about 200,000 square miles reserved for such search in an undeveloped country resulted in the provisional retention of plots covering only about 2,000 square miles. Further examination resulted in the retention of only about 800 square miles, and a portion of this area may still be returned to the Government concerned as not likely to be petroliferous. The concession for search was granted in the year 1912, the first rejection took place after four years, and the second rejection has been gradual from that date to this.

As a contrast to the instance given of Texas, references may be made to the success of the "Shell" group where considerable tracts have been placed under their control and worked on scientific lines.

Borneo.—An area exceeding 600 square miles has resulted in the valuable portions of it being reclaimed from jungle and a production of something like 800,000 tons per annum, bringing a revenue to the potentate many times greater than he had ever dreamt of.

Sarawak.—The whole of Sarawak, covering 50-60,000 square miles, has been confided to the Group for the purposes of oil production. This British territory is now fast growing into a valuable asset to the Empire, and would have progressed at a greater pace had it not been for the war and the undeveloped nature of the district which called for the creation of a harbour and other necessary facilities.

Mexico.—The area at the control of the Group is large, the production enormous, but expansion has been seriously delayed by reason of the war.

Egypt.—The phenomenal success obtained under the Group's control and arising out of a field discovered by their experts and previously unknown, is a tribute to their attainments and has been freely acknowledged in the recent report of the Financial Advisers Egyptian Budget, 1917.

The proposal put forward by Colonel Shillington was founded on terms and conditions arranged by a subsidiary of the Group, with the Governor of Trinidad and Tobago under the auspices of the Crown Agents for the Colonies in Whitehall varied only by the different conditions which prevail and the different knowledge of the underground conditions which in the case of Canada call for a period of search and exploration which had previously been expended on Trinidad, but after hearing Mr. Meighen's views the Group are prepared to negotiate on the lines set forth in this memorandum.

It may not perhaps be necessary to refer here to the financial powers of the Group, but occasion is taken to send herewith copies of the last Balance Sheet of the "Shell" company, and copies of the speech of the Chairman at the last Annual General Meeting, which may probably be sufficient to cover this point.

The second question now arises:—

If it be admitted that exploration and exploitation of oil deposits may most advisedly be carried out over a wide area, and under special terms, what returns and guarantees do the Government receive in consideration for the concessions granted by them?

It is suggested that the Dominion Government may feel justified in confiding to the "Shell":—

(1) the search for a deposit.

(2) the geological exploration,

and (3) the eventual exploitation on something like the following terms:

(1) The Group will provide the personnel, the technical knowledge and the management of the whole undertaking.

(2) The Group will provide the funds necessary for the above work, receiving as interest for their advances a cumulative preferential interest at the rate of 6 per annum, and as security to the Government for the due working of the property will be content only to receive this interest out of the earnings.

(3) The Group will operate the properties on behalf of the Dominion Government, receiving as renumeration for the provision of funds, and for their care and control, half of the net profits arising from the venture, the other half belonging to the Government, thus affording the Canadian people through the Dominion Government a direct interest in the undertaking.

(4) The venture to be free from import and export duties; from Dominion and Provincial and Municipal taxation; and to receive the existing bonus on oil produced.

(5) The venture to be assured by the Government of all trading rights, way leaves, and generally to receive the reasonable support of the Government in its operation,

(6) Should the Dominion Government so desire a Canadian Company would be formed on which a minority representation by the Government would be cordially invited.

The rough scheme is devised with the object of allowing the production of oil at the lowest possible cost, a condition which is required by reason of the geographical location of the expected field being unfavourable for export purposes, while the production is hoped to be largely in excess of the local demand; moreover, the climatic conditions, especially in the northern part of the territory would seem to call for expenditure largely in excess of the usual. The power to produce oil at a low level of cost is one which should seriously strengthen the position when in due course values fall to a normal level ,and would place the venture in a favorable position as compared with competing producing countries.

The area for search should be that portion of the Province of Alberta lying north of the Athabasca river, and that portion of the North-West Territory between longitude 110° and 125° W., bounded on the north by latitude 630°.

The area for close geological examination to be selected from the above by the Group without injury to already existing rights.

The area for exploitation to be selected by the Group, but confined to ground the mining rights to which are now held by the Province or Dominion Government.

Should the Group find it desirable to acquire rights within the exploration area already granted to other parties they shall be considered as part of the general venture.

A Night Lettergram.

Edmonton, Alta., Nov. 23, 1918.

Hon. Arthur Meighen,

Winnipeg Telegram twenty-first, states shell oil company England has absolute rights for a number of years to all oil properties lying in Canada from the Eastern side of the Rocky Mountains and International Boundary line to the Arctic Ocean, and that order-in-council going through. Is this true? Number of companies now operating have attended me protesting against such measures. Please send draft bill before taking final action. Please wire.

H. A. MACKIE.

"The Winnipeg Story."

"A wild rumor is in circulation here to-day to the effect that Sir Robert Borden, Premier of the Dominion, has delivered to the Shell Oil Company of England, for a consideration, absolute rights for a number of years, to all oil properties lying in Canada, from the eastern side of the Rocky Mountains and from the international boundary line to the Arctic Ocean."

"After this term of years has elapsed, the Shell Oil Company is to choose ten per cent. of the productive oil lands, the rest to be sold to purchasers. All the existing oil rights at this time are to be expropriated the company on a purchase basis for the amount of money already spent on the properties in development."

"The right, it is said, was given by Sir Robert just before he sailed for Canada. An Order-in-Council covering the sale, will soon be put through, it is declared.

"The Shell Oil Company controls oil wells in Persia, Mexico and other countries. It supplies the British Navy with material.

"Rumour has it that the Standard Oil Company, approached the Premier, making a bid for this huge concession, but the Shell Oil Company bid a little higher."

"If the story is true, then the deal will be one of the largest in history, as this vast aggregation of capital will acquire control of something like 75,000 square miles of territory."

Hon. Mr. Meighen Says No Such Step Taken.

Ottawa, 25th November, 1918.

H. A. Mackie, M.P.,
Edmonton, Alta.

Your wire re paragraph in Winnipeg Telegram received. Government has taken no such steps as intimated in your message. A. MEIGHEN.

Calgary, Alta.,
30th November, 1918.

Hon. Arthur Meighen,
Dear Sir,—

Under date of November 21st, 1918, an article appeared in the Winnipeg Telegram stating "Rumor says Canadian Oil Lands taken; story has it that Sir Robert Borden delivered absolute rights to Canada Oil Territory to English Company, etc."

I have received inquiries asking me if there is any truth in this. I would be obliged if you would look at the article, and if there is any information you can give me I shall be glad to receive same.

(Sgd.) T. M. TWEEDIE.

Ottawa, Canada,
7th December, 1918.

Dear Mr. Tweedie,—

I have to acknowledge yours of the 30th regarding a paragraph which appeared in the Winnipeg Telegram under date of the 21st ult. I have received several communications respecting this, and have told my correspondents that no such action has been taken by the Government as that indicated in the paragraph referred to.

(Sgd.) A. MEIGHEN.

G. N. W. Telegraph.

Peace River, Alta., 2-3.

W. A. Cory,
Deputy Minister Interior, Ottawa,

Edmonton Bulletin twenty-fifth and Winnipeg Telegram twenty-first, have articles saying Government passed Order-in-Council disposition of oil rights in Canada covering leases and developed properties Peace River leases. Much excited. Please wire me regarding same, as it has paralyzed oil business here in meantime; cannot credit it.

J. J. RUTLEDGE.

Ottawa, 3rd December, 1918.

J. J. Rutledge, Esq.,
Peace River, Alta.

Wire received. Government has taken no such steps re oil rights as indicated in Winnipeg Telegram.

W. W. CORY.

Peace River, Alta.,
Dec. 3, 1918.

Hon. Minister of the Interior,

Persistent rumor here that all oil leases in Northern Alberta to be cancelled; as this is of vital importance interest here, please wire as full information as possible.

L. W. BROWN,
Sec. Peace River Unionist Ass'n.

Ottawa, Dec. 3, 1918.

L. W. Brown, Esq.,
Secretary, Peace River Unionist Ass'n.
Peace River, Alta.

No such action as suggested in your wire being considered by the Government.

A. MEIGHEN.

December 16, 1918.

Hon. C. W. Mitchell,
Provincial Secretary, Province of Alberta.

Dear Mr. Mitchell,—

Mr. Cory has communicated to me your request to be furnished with a copy of the memorandum of Sir

Reginald MacLeod and Mr. Benjamin, dated 13th July last, making certain proposals regarding oil development in Alberta, and northerly in the N. W. T. I am enclosing a copy of the memorandum herewith. I may say that no action has been taken on these proposals, and there are certain features of them, which in my judgment, could not be accepted.

Under present conditions the responsibility of course for the disposition of this subject is with this Department, but I would be glad to have, in an informal way, any general views you may care to express.

(Sgd.) ARTHUR MEIGHEN.

Dec. 6, 1918.

H. H. Rowatt, Esq.,
Controller of Mines,
Department of the Interior,
Ottawa.

Dear Sir,—

We wish you would inform us what effect, if any, the enclosed statement, which is copied from the Edmonton Bulletin of the 28th day of November, 1918, will have on the leases held by the Athabasca Oils, Ltd.,

(Sgd.) F. JOHNSTON.

Ottawa, Dec. 21, 1918.

Sir,—

I beg to acknowledge the receipt of your letter of the 6th instant, enclosing a copy of what would appear to be an extract from the "Edmonton Bulletin" of the 28th ultimo, in which the statement is made that for a consideration absolute rights to all petroleum properties in Alberta have been granted to a company, together with the right of expropriation.

In reply I beg to inform you that this Department has no knowledge of the grant referred to in this newspaper item. It would appear, however, that in case such a grant were made it could not effect rights which have already been disposed of by the Crown under the provision of the regulations, and which rights are still in good standing.

(Sgd.) H. H. ROWATT,
Controller.

Edmonton, Dec. 26, 1918.

Dear Mr. Meighen,—

I have had forwarded to me, by the Hon. Mr. Mitchell, a copy of a proposal b ythe Shell people for concessions in Northern Alberta.

While I should be very glad to induce capital to come in and develop our North Country, I am unalterably opposed to the granting of a large concession to any private individual or corporation in order to get them to do so.

(Sgd.) CHAS. STEWART.

Toronto Branch Canadian Mining Institute, Asks Questions.

The Canadian Mining Institute,
Toronto Branch,
January 14, 1919.

The Honourable, The Minister of the Interior,

Dear Sir,—A statement has recently been appearing in the Canadian newspapers and periodicals to the effect that the Shell Trading and Transportation Company, Limited, has applied for an exclusive concession of a large block of land in Alberta, on which to search for oil and possibly for other minerals, and that the Government of Canada is considering the application, and that a decision is expected soon.

Members of the Canadian Mining Institute, at a meeting held in Toronto on Saturday, January 11th, appointed us a committee to ask you whether such an application has been made to you or to the Government, of which you form a part, and if so what are the terms and conditions of the application.

Trusting that you will favour us with an early reply containing the information asked for, so that we may submit it to a meeting to be held on Friday the 17th instant.

(Signed) J. B. TYRRELL,
REGINALD E. HORE,
H. L. KERR.

Ottawa, January 16, 1919.

Dear Mr. Tyrrell,—I am in receipt of your favour of January 14th, with reference to certain statements that have been appearing in Canadian publications to the effect that the Shell Trading and Transportation Company, Limited, have applied, and are securing, an exclusive concession of a large block of land in Alberta. It is true that this company has submitted certain proposals to me, but they were refused. Another one of an entire different character has been submitted, but I cannot, in its present form, recommend its acceptance. The question has never been considered by council, largely because the question of the Natural Resources for the Western Provinces was up for consideration. I might add that it is not the policy, nor would it be reasonable, to expect this Department to submit the nature and terms of any application addressed to the Department before it had even been brought to the attention of the Ministers of the Government. I am sure you will agree with me in this.

A. MEIGHEN.

January 21, 1919.

The Honourable, The Minister of the Interior,

Dear Sir,—We beg to acknowledge receipt of your letter of the 16th of January, and to thank you for the information that the Shell Trading and Transportation Company, Limited, submitted certain proposals to you, which were refused, and that another proposal from the same company is now before you.

We would strongly urge you to submit the proposals of the company to the members of the Canadian Mining Institute, or at least to a committee appointed by the Institute, for consideration and criticism. The Institute is composed of mining men from all parts of Canada, men who are acquainted with the mineral resources of the country better than others, and who are vitally interested in the success of the mining industries. The great mass of technical knowledge, judgment and executive experience possessed by our members is at your disposal if you care to use it, and we would press upon you the advisability of making full use of it.

The Toronto members of the Institute will meet again on Saturday next, at which our Committee will report, and we should take it as a favour if you would send us a further reply by that date.

(Signed) J. B. TYRRELL,
REGINALD E. HORE,
H. L. KERR.

Ottawa, 23rd January, 1919.

Dear Mr. Tyrrell,—May I in Mr. Meighen's absence acknowledge your letter of January 21st, in which you suggest that the proposals of the Shell Trading and Transportation Company, Limited, should be submitted to the members of the Canadian Mining Institute for consideration and criticism? You are probably aware that a Minister of any Department would hardly be justified in submitting data of this character to the public before the data was even submitted to the members of Council and before the Government as a whole had an opportunity of giving them any consideration whatsoever. Mr. Meighen has not felt disposed to accept favourably any application from this company, and in consequence would not be in a position to place them in your hand. He will be absent from Ottawa for a week or two, but I felt that in his absence I should submit the statements above and as well add that I shall be very pleased to bring your further letter to his attention upon his return as well as a copy of this reply.

Toronto, Ont., January 28th, 1919.

The Honourable, The Minister of the Interior,

Dear Sir,—Re Shell Trading & Transportation Company, Limited.

We beg to acknowledge receipt of the letter of the 23rd inst. from your secretary, Mr. Mitchell.

On Saturday last the 25th inst., a meeting of the Toronto Branch of the Canadian Mining Institute was held here and the communications which have passed between us were submitted to that meeting. After some little discussion the following resolution was proposed and passed unanimously:—"That in communicating with the Minister of the Interior this Committee should accede to his position that the information sought should not be disclosed prior to its submission to Council, but that the Committee make clear to him that the position of the Canadian Mining Institute is that no contract be closed with any person ((except on the terms of the Regulations of the Department, after due publication thereof), except after being furnished with the opinion and analysis of the Institute upon the proposal about to be acted upon, and that the Committee emphasize to the Minister that any communication made by him to the committee shall be held as confidential until the proposal is disposed of by the Government."

This Institute is the natural guardian of the mining interests of the Dominion, and, on account of the knowledge and experience possessed by its members, is the proper judge of what should be done to promote the welfare of the mining industry, and of what should not be done to hinder and disturb it.

We would therefore urge you to accept the good offices of this Institute, and to decline to make a final extraordinary contract with the Shell Trading and Transportation Company, Limited, or with any similar Company, before you have submitted the proposed contract to this Institute for its approval.

(Signed) J. B. TYRRELL,
REGINALD E. HORE,
H. L. KERR.

Ottawa, Ont., January 31st, 1919.

Dear Mr. Tyrrell,—I am in receipt of your favour of January 28th, and have, as well, reviewed the previous correspondence.

There is no information I am at liberty to give in the matter, other than that contained in the letter of my Secretary of the 23rd inst. I fear the acceptance of the principle you advance, that any separate body is the natural guardian of the mining or other interests in the Dominion, in such a way as to involve submission of all matters affecting such interests to that body for approval, would, if generally applied, lead to far-reaching and unnecessary difficulties. The practice stated in my Secretary's letter is, I think, the invariable practice, from which I would not be justified in departing.

This letter is in no way an evidence of failure to appreciate the work of your institute. On the contrary, I would be glad at any time to give the closest attention to any representations submitted to me on behalf of that institute.

A. MEIGHEN.

Toronto, Ont., February 11th, 1919.

The Honourable, The Minister of Interior:

Dear Sir,—We beg to acknowledge receipt of your favour of January 31st, which was laid before a meeting of the Toronto members of the Canadian Mining Institute on Saturday last.

After full discussion, our Committee was asked to point out, in reply to your letter, that we have not asked that "all matters affecting such (mining) interests" should be referred to the Institute, but merely such matters as it is proposed to dispose of by special Order-in-Council, and without regard to the present Mining Regulations. We do ask that before your Government takes any extraordinary action in disposing of mining rights in public lands it should consult those who have made a life study of the mineral resources of Canada, and who are consequently the best men available to advise on the proper action to take in emergency legislation, and we have no hesitation in saying that all such men are included in the membership of this Institute.

The experience of the past few years has emphasized the value of technical knowledge in dealing with technical subjects. Other Governments, such as those of England and the United States, have made free use of technical advisers experienced in managing and financing mining enterprises, and even our own Government, in other lines of industry, has endeavoured to avail itself of technical advice, but in Mining, which is, next to agriculture, the greatest productive industry in the Dominion, the special knowledge and experience possessed by the men of our profession has not been effectively used.

As citizens of Canada we are anxious to promote the welfare of the Dominion along the line in which we have the fullest knowledge and widest experience. We offer you that knowledge and experience freely in order to place you on an equal footing with others with whom you may be called upon to deal, and who have already secured the best technical advice that they are able to employ.

We fear that the Government is likely to make a bad bargain for Canada if it does not use the special knowledge which the members of the Canadian Mining Institute possess, and we feel certain that the country will be in sympathy with us when it understands the position we have taken.

However, we sincerely hope that you will not allow the Government to be drawn into a secret bargain for the disposition of our mining lands, but that, if an offer or proposal should be made to you to take over mining rights on certain conditions that might seem to you to

be beneficial to the country at large, you will consult this Institute, or at least a Committee of its members, for whose knowledge and disinterestedness it can vouch, before you decide on any definite course of action which would bind the country.

J. B. TYRRELL,
REGINALD E. HORE.
H. N. KERR.

February 14th, 1919.

J. B. Tyrrell, Esq.
Toronto, Ontario.

Dear Sir,—Answering your letter of 11th February, I can only say that while departing in no way from the terms of my letter of 31st January, I quite concede the necessity of being advised with regard to technical subjects by those having technical knowledge, and the desirability as well of having the views of an organized body of professional men such as the Mining Institute, on questions relating to mining.

A. MEIGHEN.

(*Continued in Next Issue.*)

THE COAL MINES OF MACEDONIA.

In Macedonia coal in abundance is found in the valleys, appearing above the surface in many places. In the valley of Kossovo, in the neighborhood of Sibovtzi and Hade, along the Sitnitza River to the south-west of the town of Prishtina and around the village of Shashkovitza, in the northern extreme of the valley to the southwest of Prishtina, the coal deposits are extensive and valuable. The layers are usually about 4 3-10 ft. thick, with a northeasterly direction, almost horizontal, and showing above the ground, in some places, the distance of a kilometre. The Serbian railways were formerly supplied with coal from this particular region. In the basin-like valley of Prizrend coal also appears above the ground in layers averaging 2 ft. thick. The same condition is found in the narrow valley of Piscupshtina River in the environs of the villages of Lukovo, Perezi, and Berovo up to Mercybev in the Ochrida district. In these particular localities the surface layers average in thickness from ¾ of a foot to 4.35 ft., but this coal has only a local value, as it is far from the railway.

In the Pelagonian Basin coal is also found in the outskirts of Seletchka mountain towards Prilep, Suhodol, and Jivonia. On the Teherna River, in the near distance, are layers from 3.25 to 6.75 ft. thick.

While peasants were recently digging a well near the village of Tzaridvor, in the Ressen Valley, coal was found 16 ft. from the surface: the vein, however, was but 2.25 ft. in thickness. Enough coal has already been found in this particular locality to supply the entire neighborhood, and in all probability there are other and greater deposits not yet located.

In the districts around Skopie coal is found in quantity and of very good quality, the veins being from 2 to 3 ft. in thickness. In the vicinity of Bardovtzi to the west of Skopie, the same kind of bituminous coal is found; as also in the neighborhood of Kitchevo.

Macedonia is undoubtedly rich in coal, but proper measures have never been taken to locate the deposits, or to work intelligently the veins. In the opinion of the United States Consul-General at Sofia, Macedonia under friendly rule will present a most promising field for the investment of capital and the development of its natural wealth.—Journal Royal Society of Arts.

Jones & Glassco, Reg'd., announce the appointment, as their Toronto representative, of Mr. P. M. Laing, recently Toronto branch manager of Herbert Morris Crane and Hoist Co. Mr. Laing has had broad experience in the engineering field, particularly as applied to transmission appliances and equipment, having been for a number of years connected with the Positive Clutch and Pulley Works, and also the Elmira Machinery and Transmission Co. This experience, combined with several years' architectural, engineering and industrial study of applications serving a wide clientele, has earned for him a highly respected connection both in Toronto and throughout Ontario. A call at the Toronto Office, located at 1203 Bank of Hamilton Building, will find Mr. Laing ready to respond to all enquiries of the well-known firm of Jones & Glassco, Reg'd., in the power transmission field.

Recently Toronto Branch Manager of Herbert Morris Crane & Hoist Co., now appointed Toronto Representative of Jones & Glassco (Reg'd), Power Transmission Specialists.

The Marquis of Queensberry has returned to London and reports having acquired large oil and other interests in the Peace River district.

Oil Notes

DRILLING FOR OIL IN NEW BRUNSWICK—ENCOURAGING RESULTS.

By courtesy of Mr. Matthew Lodge, of Moncton, the JOURNAL is able to corroborate the reported oil strike in New Brunswick referred to in our issue of the 18th of June (page 424.) Well No. 18 is in oil sand at a depth of 2,662 feet, the drill having penetrated some 40 feet of sand. The well flowed intermittently for some hours until it was shut in, the pressure sending the oil over the top of the derrick. The pressure blew the capping off, and considerable oil was lost.

The D'Arcy Exploration Company, a syndicate organized by the Anglo-Persian Pil Company for exploration purposes is now drilling three holes at different parts of the province, one at Port Elgin, one near Buctouche, and one at Coal Branch on the Canadian Government Railway. These are test wells, and it is the intention of the Exploration Company to explore the whole province in a similar manner.

The Syndicate also controls the large shale deposits in Albert & Westmorland counties, under option, and developments may be shortly anticipated. The work of exploration is under the direction of Dr. J. A. L. Henderson, who is the Technical Adviser of the New Brunswick Gas & Oilfields Co.

Those who are interested in the work of exploration express themselves as being very much encouraged in regard to the future oil situation in New Brunswick.

PROF. GWILLIM TO INVESTIGATE PEACE RIVER OIL PROSPECTS.

Blanket Concessions Objected to.

Vancouver, June 21.

Professor J. C. Gwillim, Professor of Mines at Queen's University, Kingston, has been retained by the Provincial Government for special duties under the provisions of the Coal and Petroleum Appropriation Act, passed at this year's session of the Provincial Legislature. This announcement was made by Hon. T. D. Pattullo, Minister of Lands.

Professor Gwillim will make a detailed investigation of certain lands in the Peace River section, upon which a reserve has been placed by the Department of Lands, for the purpose of testing the presence of oil in commercial quantities. It will be recalled that under the Act above named an appropriation of $50,000 was made to be expended by the Department of Lands to aid in the development of coal, petroleum and natural gas lying under Crown lands.

For some considerable time past Professor Gwillim has been retained at frequent intervals by the Dominion Government in connection with geological survey work, while he is well known as a mineralogist throughout Canada. He has also carried out very important missions for the Department of Natural Resources of the Canadian Pacific Railway Company.

A substantial "strike" in the Peace River country would advance the development of the northern central section of British Columbia very considerably. It will be realized, however, that the Province cannot afford to adopt a policy that creates a monopoly of any of its natural wealth, and no blanket concessions should be given. If oil is found it should be a valuable discovery; if it does not exist in commercial quantities the public will have reliable information as a protection against the wild-catter. So in any case the experimental legislation passed at this year's session has a double value.

THE DISCOVERY OF OIL IN DERBYSHIRE (ENG.)

In the British House of Commons, Mr. Kellaway (Deputy Minister of Munitions), in answer to a question, said he was glad to be able to inform the House that the borers had struck oil at Hardstoft. This was one of the areas being tested by Messrs. Pearson for the Ministry of Munitions, in connection with the Government's oil development scheme. The work was commenced in March, and on Tuesday of last week a depth of 3,075 feet had been reached, and traces of oil were found, and when the work was resumed the next morning the oil rose raidly to a height of 400 feet, and boring had to be stopped to ensure the oil being kept under control. The oil, he was advised, was of light gravity and of good quality, but the oil-bearing rock had been penetrated only a few inches. It would be a mistake to have any sanguine expectations on what had occurred, but the experts in charge of the works expressed themselves as satisfied with the prospects of this first serious effort to explore the oil possibilities of the country. He desired, on behalf of the Government, to congratulate Lord Cowdray and his staff, and Sir John Cadman and the petroleum executive, who had shown great energy and determination in connection with the work, in spite of sceptical criticism. So soon as he could, he would give full information as to the progress made.

At a later date Mr. Kellaway stated in the House that the oil at Hardstoft had reached a height of about 2,400 ft. and was rising at the rate of about 340 feet a day. Sir John Cadman, in the course of an interview, has remarked that the prospects were very good. Great credit is due to Dr. Veatch, the American geologist, Mr. Crandall, and Dr. Hackford, Lord Cowdray's chief chemist, all of whom reasoned from the geological and chemical aspect and advised a trial bore at Hardstoft. Though it was impossible even now to say whether oil was present in commercial quantities, the results showed that they were justified. "If this were in the United States," he continued, "there would be a 'boom,' wells would be sunk all over the place, and the map would be changing hands every day. Fortunately the Government controls drilling, and that cannot happen in this country. Meanwhile we have got to get a definite policy, and that is receiving Cabinet attention. Whose oil is it and how is it going to be worked? Those are questions the Cabinet is deciding. Meanwhile control has passed from the Ministry of Munitions to the Petroleum Executive, and work is proceeding on the lines already started. The oil is a true paraffin base oil of very high quality, with 10 per cent. petrol, 40 per cent. kerosene, and the balance is made up of lubricating oil, gas oil, and fuel oil. This sample has all the characteristics of high-grade crude. On the whole the results justify the investigation, and are a triumph for scientific reasoning."

Nova Scotia Notes

Inverness Coal & Railway Co.

The National Trust Company has given notice in the Supreme Court of Nova Scotia of its intention to foreclose the mortgage of the railway property of the Inverness Coal & Railway Company. Mr. John McGillivary, who was General Manager of the company for some years, and has latterly been acting as Receiver, has resigned, and the Court appointed the Eastern Trust Company as Receiver in his stead. The motion came on for directions as to procedure—whether it would be advisable to close the Inverness Colliery entirely, or to keep it pumped out until it was sold. The Chief Justice suggested that as important interests were involved the motion should be adjourned until July 29th, and that the Commissioner of Works and Mines of Nova Scotia and the Minister of Railways should be advised of the nature of the motion.

This is very serious news for the people of Inverness County, where the production of coal has shown a steady decline for many years past. The output of the Inverness Colliery for the past few years has been as follows:

	Gross Tons.
1915	245,749
1914	264,842
1913	293,447
1916	265,427
1917	202,719
1918 (approx.)	200,000

The mine workings, which are on the seven foot seam only, are entirely submarine. The face of the slope is about 7,000 feet from shore, and the dip off the measures is varyingly steep.

The Mabou Mine and the Port Hood Mine were flooded by inbreak of the sea some years ago, and Inverness is, and has been for some time, the only producing colliery in Inverness County, with the exception of a small output which is being obtained from crop workings above sea-level near Port Hood.

Inverness County coal, while not particularly suitable for metallurgical processes, is a favorite house coal, being free-burning, and when screened a clean bright coal suitable for steam raising and open grates.

It has never been demonstrated that the Port Hood mine is irrecoverably flooded, and that there is good reason to believe that the influx of water which closed the mine did not enter by a direct overhead break from the sea-floor, but was the accumulated result of percolations through the partings of the strata where they emerge from the sea between high and low water mark. In any case, the feasibility of again working the mine could only be tested out by a company well furnished with capital and equipment.

There is an undeveloped land area of coal north of Inverness, known as the Ste. Rose areas, which might be capable of commercial operation if they were connected with the railway, and the purchase of the properties were effected at a reasonable price.

The only prospect for the coal industry in Inverness County as a reasonable success would be if one financially strong company were to control and operate the whole of the coal properties in that county, namely, Mabou, Port Hood, Inverness and Ste. Rose, along with ownership and control of the Inverness Railway, which it is difficult to think of as a paying proposition unless it were used as a combined passenger and coal-freight road.

Acadia Coal Co.

Coal production for the first half of 1919 from this company's collieries is expected to reach 190,000 tons, which compares with 111,063 tons for the first half of 1918.

Dominion Coal Co.

A new shaft is being sunk between Dominion No. 1 Colliery and No. 2 Colliery. It is reported to be down 210 feet, and at 227 feet it is expected will strike the Harbour Seam. The Phalen Seam, to which the shaft will be eventually sunk is expected to be met at about 900 feet. The shaft is intended to be used for the lowering and raising of the workmen, It will also enable economies and improvements in the ventilation system.
and will shorten the walk to work very considerably.

It is also reported that the Dominion Coal Company is putting down test diamond drill holes with a view to re-opening the Gardiner (or Lorway) Seam at the Gardiner Mines, where it was formerly worked quite extensively by coal-cutters on the longwall system previous to 1893. The coal in this seam is known to be of good quality, particularly adapted for steam-raising and steamship bunkers. The area of this seam underlies and extends beyond the land-area of the Harbour and Phalen Seams, which have been worked above it, and it is therefore a virgin seam—or practically so—of greater area than any other of the seams worked by the Dominion Coal Company under the land area of the Glace Bay Basin. The seam is about 4 ft. 6 ins. in thickness.

Nova Scotia Steel Co.

Good results have been obtained in the Jubilee Colliery by the use of an electric locomotive underground operated by storage batteries.

FERNIE STRIKERS ASK FOR COMMISSION:

Fernie, June 20.

After nearly four week of strike in coal mines here and throughout District 18 of the United Mine Workers of America with apparently no outward attempt towards settlement, miners' headquarters have applied to Premier Oliver for appointment of a commission to investigate wages and working conditions within the mines, and have undertaken that upon this request being granted the strike will be declared off within twenty-four hours.

Similar representations have been made to the Dominion Government through Dr. Donnell, the local member, and an extract from a communication received from him yesterday read as follows: "Federal Government has no jurisdiction whatever over working conditions in the mines of the Crow's Nest Pass Coal Company. This jurisdiction is strictly in the hands of the Provincial Government at Victoria."

A telegram was received last night from Premier Oliver stating that the Provincial Government had the local situation in hand and that further information as to a proposed offer for settlement by the Ministers would be forthcoming shortly.

Special Correspondence

NORTHERN ONTARIO.

Porcupine V. N. T.

Arrangements have been made to resume work at the Porcupine V. N. T. just as soon as labor conditions appear to be satisfactory, an official of the company told the "Journal." Reports that work was to resume immediately, it was stated were premature in that there was no intention of starting up until the handicap of endeavoring to operate under the burden of industrial unrest gave reasonable evidence of being eliminated or at least minimized.

The property has been developed to a depth of 600 feet. At the 400-ft. level a large tonnage of commercial ore was opened up, while at the 600-ft. level a large body of ore was encountered but was not developed extensively prior to closing down.

Although the Porcupine V. N. T. has very little cash in its treasury yet of the $3,000,000 authorized capital, some $750,000 remains in the treasury in the form of unissued shares. This, in due course, will be available for construction purposes, and should suffice to install a new large mill, in addition to the present mill, with a daily capacity of about 100 tons.

Keeley Mine, South Lorrain.

Work is proceeding at the Keeley mine, in South Lorrain, the operators being apparently confident of gradually being able to enlarge the scope of work profitably.

Major J. McIntosh Bell, representing the present control, paid a visit to the property during the closing week of June.

Silver Discovery in N. Manitoba Not Confirmed.

The reported discovery of silver at mile 235 on the Hudson Bay Railroad north from The Pas, in Northern Manitoba, has been found to have been unreliable, the truth of the matter being that a calcite vein was discovered in which no mineralization appeared.

Kirkland Lake Gold Mines.

In an interview with Frank L. Culver, president of the company, it was learned that the physical condition of the Kirkland Lake Gold Mines is exceedingly strong. Although the mine is now closed down on account of the labor strike, yet the bins are full of ore, a dump containing 8,000 tons of ore is available for milling, stopes at the 300-ft. level are full of ore, and new stopes have been opened up in various other places along the 400-ft. and other levels.

Results recently met with at the 600-ft. level have been exceedingly satisfactory, Mr. Culver told the writers. The fact at the point where operations have been temporarily stopped, shows a width of 15 feet of ore containing average gold values of $55 to the ton. Parallelling this ore body in close proximity is another three feet of ore containing average values of $28 in the present face. At the 700-ft. level the heavy mineralization has been found to continue and some very rich ore has recently been opened up at that depth. This is not only the deepest working in the Kirkland Lake Gold Mines, but is the deepest point to which operations have been carried in the Kirkland Lake camp. With the resumption of work in due course it would be reasonable to look for a long period of prosperity for the mine.

In the construction of the macadam road from Swastika to the centre of activity in the Kirkland Lake district the labor strike resulted in a curtailment of work for a day or two, after which the men returned to work. The road is being built by the Ontario government.

Coleman District.

Financial arrangements are being made to resume work at the old Hylands property, situated in Southeast Coleman.

The old Mohawk property in Western Coleman, situated on the west side of Mud Lake has been reopened. The property is controlled by Petrolia interests, with whom was formerly associated the late William Gleason.

A good deal of work was done on the property in the early days of Cobalt, some smaltite and bloom being encountered, but without commercial silver values.

Elk Lake Growing in Importance.

Mining men recently returned from Elk Lake report more than usual activity in that district. The increasing activity in the Gowganda field, the amount of work being done in the Fort Matachewan gold area, and the large force of men engaged in the construction of a macadam road from Elk Lake to Gowganda all combine to make Elk Lake unusually busy.

Now that the government has actually begun the construction of the macadam road to the Gowganda field, Elk Lake appears to be reasonably assured of being the distributing point for the various mining districts, including the Maple Mountain, McKenzie Lake and Gowganda silver areas, as well as the Fort Matachewan gold area.

Purchase of Gold-Mine Shares Recommended.

That the present period of depression affords an excellent opportunity to purchase shares in some of the leading gold mining companies of Northern Ontario, is the opinion expressed by one of the most successful mining men in this district. One authority pointed out to the writer that for upwards of four years the economic conditions throughout the world had been working to the disadvantage of the gold mining industry, and had resulted in the depreciation of the quotations for shares in gold mining companies. War and gold mining, he said, never go hand in hand, whereas peace and gold mining do.

The signing of peace, and the probability of industrial unrest in this country being short lived seems to mark the turning point, and apart from the usual fluctuations the general trend in the quoted value of the gold mines is expected to record a more or less steady upward swing. Such is the expressed opinion of one individual, of course, but it is the voice of a man whose actions in the past appear to have been guided by wise judgment.

Dome Mines—Dividend Possibilities.

With the mill running at about half capacity, the Dome Mine is treating about 650 tons of ore daily and producing about $120,000 monthly, it is understood. This is an indication that mill heads are running in the neighborhood of $6 to the ton. For the time being a profit of about $2 per ton is indicated, or at the rate of about $40,000 a month, which is at the rate of not far under twelve per cent. annually on the company's issued capital.

When the mill is brought up to full capacity later

on in the year, the grade of the ore will probably be reduced to about $5 or $5.10 per ton. Also, accordingly as the tonnage is increased the cost of producing will decrease, and conservative mining men now look forward to a net profit of $2 per ton on all ore treated, and which would indicate $2,700 net profit daily, or at the rate of $985,500 annually, with the mill running at full capacity of 1,350 tons daily.

This would make it possible to resume dividend disbursements at the rate of twenty per cent. annually, and leave about $185,500 to be carried to sulplus each year. It appears to be the consensus that when President Bache stated that dividends would be resumed in January next, the declaration was based on sound calculations.

New Gold Find Reported in Fort Matachewan Area.

Another promising discovery of gold is reported to have been made on a claim situated in the neighborhood of the Big Bend waterfall in the Fort Matachewan gold area. According to reliable information, samples taken from the surface of a large dyke containing heavy iron sulphides show substantial gold values.

Tough-Oakes Merger.

The merging of the Tough-Oakes with the Burnside and the Aladdin-Cobalt companies is now considered accomplished, but for the time being the syndicate is not included in the merger, a hitch having occurred in negotiations.

Mining interests in Buffalo have been quietly accumulating shares in the Sylvanite company, and two factions appear to be making a bid for control. The English interests favor the consummation of the merger along the lines originally proposed while the Buffalo interests appear to favor a change in terms. The situation is one that might be straightened out satisfactorily at more or less short notice, yet at the same time it might reasonably result in prolonged negotiations.

Kerr Lake May Production.

During the month of May the Kerr Lake mine produced 105,582 ounces of silver, as compared with 104,477 ounces during the preceding month. The May output was the highest for any one month since January.

Despite the fact that production has decreased about fifty per cent. as compared with a year ago, the Kerr Lake is still yielding close to one and a quarter million ounces annually. For the first five months of the current year the output amounted to 528,318 ounces as compared with 1,085,793 ounces for the corresponding period of 1918. The quotations for silver have averaged about 10 cents per ounce above the last year period and has to some extent made up for the decline in production.

Silver-Ore Find at Skead Misleading.

The discovery of high grade silver ore on an old dump near the east boundary of the township of Skead has been found to be misleading, after careful investigation has been made. It is evident from the nature of the vein on which a test pit had been sunk that the high grade silver ore lying on the dump did not come from the vein. It is accordingly concluded it must have been carried there many years ago for "salting" purposes.

Promising Gold Find Reported on Line of Algoma Central.

A promising discovery of gold is reported to have been on a claim along the Algoma Central Railway, by Thos. Powell of Haileybury, and G. Craig of Cobalt. The find is stated to have been made near mile 61 of the A. C. R.

Kirkland Lake Properties Likely to Remain Closed Until Autumn by Wages Dispute.

The mines in the Kirkland Lake mining area, kept in operations by shareholders during the war on the expectation that the cessation of fighting would bring almost immediate prosperity to the gold mines, have closed down indefinitely. The reason for the curtailment is the fact that some 500 men, drawing a monthly pay-roll of approximately $75,000, or at the rate of $900,000 a year, have gone out on strike, following the refusal of the companies to accede to the demands of the Miners Union.

For the two years, 1917 and 1918, the mines of Kirkland Lake were able to pay only a total of $100,000 in dividends. This was paid by one concern, the Lake Shore. At the numerous other mines a stream of money was being paid out to the mine workers, each year representing a large aggregate loss to the shareholders of the various companies. The present situation is, therefore, but the inevitable climax. The mines are closed, and with them goes the source of nearly a million dollar annual pay-roll to the mine workers of Northern Ontario.

Thanks to the boundless confidence of those in control of the mines of Kirkland Lake, the camp grew more rapidly during the past two years than did any other mining camp in the Dominion. The results achieved were little short of marvellous, and there can be no question but that the shareholders will in due course reap the reward of their enterprise and optimism.

It would perhaps be folly to attempt to estimate the duration of the strike. However, after accepting the opinion of certain of the mining men that curtailment may continue until Fall, there are numerous factors that should offer encouragement to shareholders. First, is the fact that costs are abnormally high and profits reduced to a minimum under the existing conditions, whereas Fall may reasonably be expected to bring a considerable reduction in costs and a corresponding increase in profits. In the meantime, also, the construction of a macadam road from Swastika to the centre of activity should then be completed, thus reducing the cost of transportation. In one sense of the word, the shareholders will have saved money through the mines being closed, the only drawback being the more or less short delay.

For instance, provided a mine were able to produce $50,000 a month at a cost of say $45,000 a month under present conditions, as compared with a production of $50,000 at a cost of $30,000 a month a few months hence, it would indeed appear to be good business from the shareholders' points of view were the latter course to be followed. At the recent formal opening of the Haileybury Mining School, the Minister of Education for Ontario, Hon. H. J. Cody, made the remark that a large percentage of the mine managers of this country were educated in schools far removed from the mining centres, and that a great many came from abroad.

The statement was correct in every particular. At the present time the majority of the mine managers of this part of Northern Ontario are citizens of the United States. These men have had the advantages of technical education in their native land, and, in coming to Canada have become an asset to this country. The Dominion as a whole should be proud of having possessed the merit to induce such a body of men to devote their lives to the development of the great mineral resources of the Dominion. At the same time Canada should be more self-sustaining in the management of her mines, and every opportunity should be seized to further technical education in this country.

BRITISH COLUMBIA.

Moose Property is Bonded by O. B. Bush.

The Moose property in the Alice Arm district has been bonded by O. B. Bush, of Stewart, from Don Cameron, for $150,000. Work will probably start about July 15th. The Moose group adjoins the Climax up the hill, and is comprised of six claims. The vein is of pyritized quartz, occurring in what is locally termed the "silver belt." Some of the ore, which has been exposed by open cutting in several places, is very high-grade, and can be shipped when the railroad is completed.

Slocan District.

The Gold Cure Mining Company, seven claims, South Fork, Kaslo Creek, Slocan. Will resume 1st July. Company incorporated 1917, and good camp erected. Several veins from which high grade ore shipped in early days. Gold Cure adjoins the Gibson on N. and S. Gibson has been under development for the past two years. Operations are proceeding on Index, which is in the same neighborhood. Silver Bell, from which a car of ore netting $7,000, recently shipped. Cork Province also active. Motor trucks will be used to haul ore from above properties to Trail, a distance of eight miles.

BUY YOUR COAL NOW.

A survey of the coal situation by the Commission of Conservation proves that a coal shortage next winter, and possibly next autumn, is almost a certainty.

During the week ended May 24th, the output of anthracite was only 1,679,000 tons. This production is 65,000 tons LESS than the week preceding, and is 326,000 tons less than the corresponding week in 1918. While the production is falling off, retail dealers in the United States continue to be deluged with orders from customers who are insistent upon prompt deliveries.

The shortage is due to a number of causes, not the least of which is the migration of tens of thousands of Jugo-Slavs, Czecho-Slavs, Hungarians, Poles and other Europeans who are returning to Europe.

In addition, if there is such a serious shortage, we may confidently expect much higher prices for anthracite. Therefore, the Commission of Conservation advises consumers to purchase their winter supply of hard coal at the earliest possible date.

Precious Metal Mining in Northern Ontario

Gold Production Will Shortly Exceed Silver Output.

By J. A. McRAE.

The first half of the current year draws to a close a period of re-adjustment at the gold mines of this country, and marks a slight increase in output as compared with the last six months of 1918. The added financial burden imposed by the war, involving every kind of material used in connection with mining, including labor, has proved something that will not disappear with the declaration of peace. Just as the economic strain increased during the whole of 1917 and a large part of 1918, so will it require the whole of 1919 and a part of 1920 to relax. A least such is the calculation of some of those who have given the matter a good deal of thought, taking into consideration the trend of prices of material and the status of labor.

The output of gold from northern Ontario during the first six months of 1919 may be estimated at approximately $4,000,000. A labor strike at Kirkland Lake, calling the mine workers from their work about the middle of June, has served to eliminate the Kirkland Lake camp from the producing list for the time being. This is expected to be only temporary, and within a reasonably short time the industry in that rapidly growing camp may be expected to again assume large proportions. Meantime, in the Porcupine field the Hollinger Consolidated has recently succeeded in increasing its output, as also has the McIntyre-Porcupine. Also, the Dome Mines has resumed production, the output at the time of writing being at the rate of about $100,000 every thirty days. The present indications are that the last half of 1919 will see the gold output reach upwards of $5,000,000, and this added to the $4,000,000 produced during the six months just ended, will probably exceed any previous year in Ontario's history, with the possible exception of 1916, when $9,397,588 was produced.

At the rate the economic situation is re-adjusting itself to the advantage of the gold mines, the beginning of 1920 will probably see the gold mines producing at the rate of $1,000,000 every thirty days. Indeed, taking into full consideration the large number of mines which are equipped with first class reduction plants and with substantial ore reserves to draw from, it would not be surprising were production to reach $1,250,000 monthly during the year 1920. It is evident, therefore, that the silver mining areas and the gold mining areas of Northern Ontario will be healthy rivals for the distinguished position of being the leading precious-metal producing districts of the Dominion. At the moment, after taking into consideration all the visible evidence, it would be next to impossible to intelligently venture an opinion as to which industry, gold or silver, will head the list in 1920. One thing seems certain, however, and that is that unless new silver-producing mines or areas are opened up within the next year or so, the silver-mining industry will take second place to gold-mining. The reason for this is the great extent of the area in which gold is being discovered, and the enormous gold in proven ore at the mines, amounting to about four times the amount of silver ore in sight.

During the first half of 1919 there were only three important gold producers, namely: the Hollinger, McIntyre, and Lake Shore. Small producers includ-

ed the Teck-Hughes, Dome Lake and the Davidson. Recently, however, the Teck-Hughes has increased its rate of output, the Dome Mines is producing once more, and the new mill of the Kirkland Lake Gold Mines was started up.

From present indications, based on the assumption that the labor strike at Kirkland Lake will soon run its course, there may be about thirteen gold mines producing bullion by the end of the current year.

The following is the position of the mines in the Porcupine field, showing the capactiy of each plant and the extent to which the equipment is being utilized:

Mine.	Daily Capacity in tons.	Present Rate.
Hollinger Consolidated ...	2,800	Three-quarters.
Dome Mines	1,350	Half.
McIntyre-Porcupine	600	Full.
Schumacher #	200	Closed.
Porcupine Crown #	140	Closed.
Porcupine V. N. T. #	120	Closed.
Dome Lake	100	Three-quarters.
Davidson	35	Full.
Newray	30	Closed.

Note.—Those marked thus #, likely to re-open during the last half of this year.

The following mines in the Kirkland Lake and the Boston Creek districts, although handicapped now by the labor strike, may be expected to be producing at full capacity before the end of the current year:—

Mine.	Daily Capacity in tons.
Kirkland Lake	150
Tough-Oakes	140
Teck-Hughes	100
Lake Shore	70
Miller Independence	40

Among the properties where small milling plants are still in idleness with not much probability of reopening for some few months, might be mentioned the following: Newray, Burnside, Patricio, Croesus, Hill Gold Mines, Huronia and Associated Goldfields.

In summarizing the situation, it appears quite reasonable to expect to see thirteen out of a total of twenty mills at the gold mines of Northern Ontario in full operation by the end of 1919. This compares with only five in operation at the beginning of the year.

The unsatisfactory labor supply and the abnormal cost of material has been solely responsible for the majority of the mills being idle. Both of these factors show marked improvement as reflected in the greater number of mills now in operation and the general preparations to resume production at every one of the important mines.

BRITISH COLUMBIA MINE RESCUE STATIONS INSTALL U. S. BUREAU OF MINES TYPE OF BREATHING APPARATUS.

The Minister of Mines of British Columbia has received an enquiry from the State of Virginia as to the performance of the "Gibbs" type of breathing apparatus. In reply Mr. Sloan stated that six sets of the Gibbs apparatus have been added to the equipment of the Government mine rescue station at Fernie and six more have been ordered for the Nanaimo station. The Minister points out that tests of the apparatus have been conducted at Nanaimo which have proved that it is much superior to the older types of apparatus.

IN THE MATTER OF

The German Development Company, Limited

SEALED TENDERS will be received addressed to **G. T. Clarkson, 15 Wellington Street West, Toronto,** and marked "Tenders re German Development Company, Limited," up to Twelve o'clock noon of **Wednesday, July 16th, 1919,** for the purchase of the following assets of the German Development Company, Limited, namely:

Parcel No. 1.—68,000 shares, of a par value of $1.00 each, of the Capital Stock of the Miller Lake and Everett Mines, Limited, the owner of certain mining claims in the Miller Lake District in Northern Ontario.

Parcel No. 2.—Mining Claim being the S.E. ¼ of the N. ½ of Lot 9 in the 5th Concession in the Township of James, Timagami Forest Reserve, containing 39-⅝ acres, more or less, covered by Mining Lease No. 3818, from the Province of Ontario.

Parcel No. 3.—Mining Claims T. C. 453, 454, 455, 456, and 457, and M.E. 723, 522 and 523, and G.G. in the Township of Halton, District of Nipissing, containing 157 2-5 acres, more or less, covered by Mining Lease No. 3875, from the Province of Ontario.

Parcel No. 4.—Mining Claim being the N.E. ¼ of the N. ½ of Lot 12, in the 4th Concession in the Township of James, District of Nipissing, containing 4¾ acres, more or less, covered by Mining Lease No. 3878, from the Province of Ontario.

Tenders for Parcel No. 1 must be at a rate per share for the shares offered, and the tenderers must agree to purchase any lesser number of shares than 68,000, but not less than 25,000, if the undersigned shall so require.

As to Parcels Nos. 2, 3 and 4, the purchasers shall search the title at their own expense, and purchasers shall have ten days in which to make any objection or requisition as to title. In case any purchaser shall within such time make any objection or requisition which the undersigned shall be unable or unwilling to remove or answer the undersigned shall be at liberty to rescind the sale, in which case the purchaser shall be entitled only to a return of the deposit money without interest, costs or compensation.

Terms of Sale:—25 per cent cash and the balance within thirty days.

Each purchaser at the time of sale must sign an agreement for the completion of the purchase.

Tenders will be opened at the office of the undersigned, 15 Wellington Street, West, Toronto, at Twelve o'clock noon of Thursday, July 17th, 1919, when all tenderers are requested to be present.

Tenders must be accompanied by a marked cheque payable to the undersigned for 10% of the amount of the tender, which will be returned if the tender be not accepted. The highest or any tender not necessarily accepted.

For further particulars and conditions of sale application may be made to the undersigned.

Dated at Toronto this 9th day of June, 1919.

Oxy-Acetylene Welding and Cutting

STRENGTH and NEATNESS IN MANUFACTURING and REPAIRING

This illustration shows a Prest-O-Lite operator welding parts in the factory of the Packard Motor Car Co., where neatness and strength are essential.

The Prest-O-Lite Process of oxy-acetylene has been adopted as standard practice in thousands of factories, mines, machine shops and shipbuilding plants, both in Canada and the States. In the production end, this process results in increased strength with reduced weight in vital parts, while effecting substantial savings in cost.

Prest-O-Lite PROCESS

is not limited to production work. Its value in repairing is universally acknowledged. Worn and broken metal parts are quickly reclaimed and put back into useful service, avoiding costly tie-ups and delays. The actual saving on one Prest-O-Lite repair often more than pays for the entire welding outfit.

The Prest-O-Lite Process employs both gases (acetylene and oxygen) in portable cylinders. Prest-O Lite Dissolved Acetylene (ready to use) is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones. Provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Manufacturers, Mining and Production Engineers will find our welding literature full of valuable data and helpful suggestions. It may help you to reduce your costs and improve your methods. Write for it to-day.

EDITORIAL

TRANSPORTATION FOR THE NEW GOLD AREA.

Relative to the problem of carrying supplies to the West Shining Tree district, which includes the Wasapika gold area described in this number of the Journal, the Toronto World says editorially:

"The World has urged upon the government the necessity of putting more energy into the work of furnishing transportation facilities to the mining interests of the Shining Tree district.

"So long as the government lags on the performance of a manifest obligation it limits and restricts the advantages and benefits which the new gold district is destined to confer upon the entire community. Central among these advantages and benefits at the present moment would be a broad progressive effect upon our industry in minerals and metals, the potentiality of which the financial world is beginning to realize.

"Government is often asked these days to undertake expenditure in different directions where return is both uncertain and substantial. The revenue that comes from the mining industry reaches the public account before the investor gets his dividend, and sometimes before the speculator pockets his profit. Government alienates property in minerals not only because it is absolutely certain of revenue from private ownership, but because the state by obvious indirect sources of gain increasingly supplements taxation of the country's producing mines.

"So long as the certainty of production lies ahead in respect to minerals and metals the first incentive to the attainment of that stage should be felt by the government. But, as the "World" has shown, the West Shining Tree camp has reached that important point of progress along the road to productive success where it must wait for the government to come along with transportation facilities. The government has fallen behind even with temporary facilities.

"Credit must be given where it is due. A good deal of accurate, painstaking and timely work was done in regard to the mineral survey of the district. All this led up, as it was intended, to the opportunity where the government could make a safe investment in the supply of a public service to private investors who had found the government's information about the mineral resources reliable and helpful.

"It would be economy now to hasten not only the temporary transportation facilities, but to make an immediate beginning of the permanent communication by rail. Every month that this work may be delayed will mean pecuniary loss to the government itself and to the general commercial community.

"Judging by the active conditions of the new camp it would appear to be the most questionable economy to rest satisfied for a day with the completion of the wagon road that has so long been demanded."

What is immediately needed for the Wasapika area is an improved wagon road. The Ontario Government is endeavoring to make the present road useful to those who are taking in machinery to develop the gold deposits. No endeavor is yet being made to build a road suitable for motor trucks.

Fortunately the road from Westree to Wasapika crosses fairly level country, and does not encounter many serious obstacles. A bridge has already been constructed across the river at the Halfway. Timber for corduroy stands beside the roadway nearly everywhere. Gravel beds are numerous. The men and teams now at work will be able to greatly improve the road this summer. We would like, however, to see three or four times as many men and horses at work. Next year the area may have sufficiently advanced to warrant the Government converting the wagon road into a first class motor road.

So far as railway construction is concerned it seems to us advisable to consider whether a light railway such as was used in France would not answer the purpose. Returned soldiers who have made the trip to Wasapika have naturally given expression to the view that a light railway would be just the thing, and that it could be constructed economically. A good motor road would answer the purpose, but if the road is not made suitable for motor traffic a railway of some kind will be necessary. Why not a light railway?

MINING PROFITS AND WAGES.

In a statement given out at Cobalt by an official of the Miners' Union we find the following paragraph:

> "We want to be a constructive organization. We are miners and do not want to ruin the mining business from which we get our livelihood. We feel, however, that we are entitled to a wage commensurate with the work in which we are engaged. Our future lies in the mining industry as much as there is no doubt that many misunderstandings like those existing in Cobalt today would be wiped out."

This looks to us like an invitation to the managers that should be immediately accepted. As intimated

previously in these columns, our opinion is that the past history of the unions should not be allowed to stand in the way of a proper understanding now. It is well to know something of that history; but it is folly to allow it to obscure the present situation. The miners should have full opportunity for expressing their views.

They should also be made to realize that they cannot expect to take all the profits of the industry; that it is essential to the life of the industry that some operators should be very successful; that no new properties would be developed unless someone attracted by the chance of winning a prize risks his money in exploration. If he is successful there are many new jobs for miners, and if he fails the miner is not asked to pay the cost. Neither the miner nor the mining companies can be depended on to furnish capital for the development of new areas. Some do their share and some do not. Much of the money for the development of new areas must come from other sources, from those who are willing to venture in the hope of making big profits. Many a man who will taks chances himself will not ask shareholders of companies in which he is interested to take the same chances. Some who have been exceptionally lucky once are content for the future to leave the making of mines to others, recognizing that lightning rarely strikes twice in the same place. No new discovery is developed without risk to those who supply the money, and development depends largely on the faith of the venturesome in the richness of our natural resources and in their knowledge that the profits are in some instances very large.

Under the circumstances, we cannot agree with the same union official when he implies that those investing money expect to shift the burden on their workmen if a good prospect fails to make a paying mine. That is exactly contrary to the facts. There is no certainty of profit for those who furnish the money: but the workman profits whether the venture pays or not. It is true that in some cases where the price of metal has been exceptionally high the workman has received higher than normal wages, but it is also true that the workmen receive a very large proportion of the expenditures of mine operators in the case of losing ventures as well as in the successful. If there is anything certain about mining in Ontario it is that workmen will receive their wages and that they will not be asked to make good the losses of the operators. The Union official is not justified in stating that "those investing money with the hope of big returns cannot expect to shift the burden on their workmen if a good prospect fails to make a paying mine." He implies that the operators of unsuccessful ventures endeavor to shift the burden on the workmen. We do not believe this to be true.

MINERS' CERTIFICATE BOARDS—CHANGES IN BRITISH COLUMBIA.

As will be noted from our British Columbia communication, the Legislateur of that Province, on the initiative of the Minister of Mines, has amended the C. M. R. Act insofar as it relates to the method of granting certificates of competency to miners and officials by abolishing the local examining board at each colliery and substituting a travelling board. A similar reform was made in the Nova Scotia C. M. R. Act a few years ago, and in place of the persons who were formerly appointed for the purpose of granting miners' certificates at each colliery, Local Boards were appointed by the Commissioner of Mines. British Columbia has adopted a plan which is suitable for a Province of wide distances and varied mining activities. In both British Columbia and in Nova Scotia, we believe, the reform was needed to cure certain abuses in the granting of miners' certficates, which are well understood locally, but not usually discussed.

We are slightly puzzled at the statement made by our correspondent, which indicates that the employ ment of aliens in British Columbia mines is not desired, and is, in effect prohibited, by the new regulation. Alien is a term of wide application, and even the more specific appellation of "enemy alien" is difficult to apply now that Europe is being re-cast, and the former citizen of Austria-Hungry has blossomed out as one of a dozen resurrected ethnological persistences. Unless emigration to Canada has ceased—which no one believes—we expect the Dominion in the future to be enriched by the labour and national genius of many European nations, as it has been in the past. While we earnestly believe that the greatest discrimination should be exercised over incoming emigrants to Canada, and feel that public opinion agrees that our national gates have been too wide open in the past; and while also the danger to British institutions from the careless admission of undesirable European emigrants has been of late only too clearly demonstrated in Winnipeg and elsewhere, we also feel that any attempt to ear-mark for British citizens exclusvely any particular branch of endeavour in Canada will not only impose tremendous economic limitations, such as may cause public opinion to swing too quickly the other way, but will be out of harmony with Canadian policy, which in the past has welcomed good men, from any country, as potential Canadians. If the League of Nations becomes an international reality, what will constitute an "alien"?

EDITORIAL NOTE.

The concluding portion of the Oil Concession Correspondence, the last instalment of which appeared in the "Journal" of the 2nd July, is held over until the issue of the 16th July.

THE FALLACY OF THE ASSUMED ADVANTAGE OF RESTRICTING OUTPUT.

"The proposition that the prosperity of the country depends upon production in the country obtains no credence whatsoever, being generally treated by working men as a sheer irrelevance."

This most dangerous and widespread fallacy is discussed, amongst other current fallacies, by Sir Lynden Macassey in the Edinboro' Review, who says further:

"The delusions referred to cannot justly be described as 'heresy contumaciously adhered to.' They are in most cases honest misconceptions, and no solution of the labour problem is possible until all this error and mistaken belief has been swept away."

One fallacy dissected by Sir Lynden Macassey is that government intervention can override economic law, and this particular misconception is not confined to Great Britain.

A newspaper report from Sydney, Nova Scotia, states that the United Mine Workers' Executive has decided to inaugurate a five-days' working week, commencing 2nd August.

In the same announcement it is stated that plans are being made for a joint meeting of the steelworkers of the Dominion Iron & Steel Company, of the Nova Scotia Steel Company, and of the mineworkers of both companies to discuss the advisability "of asking the Government to keep these plants running."

From previous references to the five-day week proposal we gather that it is being urged because of the "assumed advantage of restricting output," and is not based on the necessity for shorter hours of work, and one must assume that the miners' leaders are sincere in their mistaken belief that enforced restriction in production will assist in the restoration of business prosperity.

The coal production of Nova Scotia during 1919 will not, we believe, reach five million tons. Year by year it has dropped from the maximum of 1913 until it is now 2½ million tons per year below the 1913 rate of production. It is necessary to go back twenty years to find as low a coal output in Nova Scotia as will be recorded in 1919. The loss in provincial royalty revenues alone is $300,000 per year, and that deficit must be made up out of taxation of the people of Nova Scotia. Canada's adverse trade balance is piling up, her credit on New York must be paid for by a higher premium than previously recorded. The Montreal market is temporarily at least lost to Nova Scotian coal producers.

It really does not matter much, this summer, whether the United Mine Workers decide to work five days per week, or any other number of days, because the choice of work will not lie with them. It will depend on the market for their labour. No juggling with hours of labour, with wages, or with profits, will permanently enable the people of any nation to enjoy or consume a greater value than that of their production.

Meantime, we commend to the earnest thought of the mine-workers of Nova Scotia one outstanding economic fact, namely, that in spite of all the capital invested in developing collieries, shipping fleets, discharging plants and markets, the coal production of Nova Scotia is back where it was twenty years ago.

THE NELSON INTERNATIONAL MINING CONVENTION.

In this issue of the "Journal" will be found a full account, by our British Columbia correspondent, of the Second International Mining Convention held in Nelson during the 19th to 20th June. An interesting feature of the Convention—and one which assured its success—is the number of organizations which combined to arrange for the meeting. These included the Nelson-Slocan and British Columbia Mining Men's Club, the Northwest Mining Association of Spokane, the Kootenay Mine Owners' Association, the Spokane Chamber of Commerce, the Vancouver Chamber of Mines, the City of Nelson and the associated Boards of Trade of Eastern British Columbia and Nelson.

The techncial programme was in charge of the Columbia Section of the American Institute of Mining & Metallurgical Engineers, and the Western Branch and Kootenay-Boundary Branch of the Canadian Mining Institute.

A mere statement of these facts, without comment, is sufficient indication of the organized comradeship that characterises the mining men of the Pacific North-West, not the least pleasing part of which is the international good-will that makes such a gathering possible, and rendered it so thoroughly successful.

---

5 DAYS WORK A WEEK.

Sydney Miners Will Inaugurate New Schedule Aug. 2.

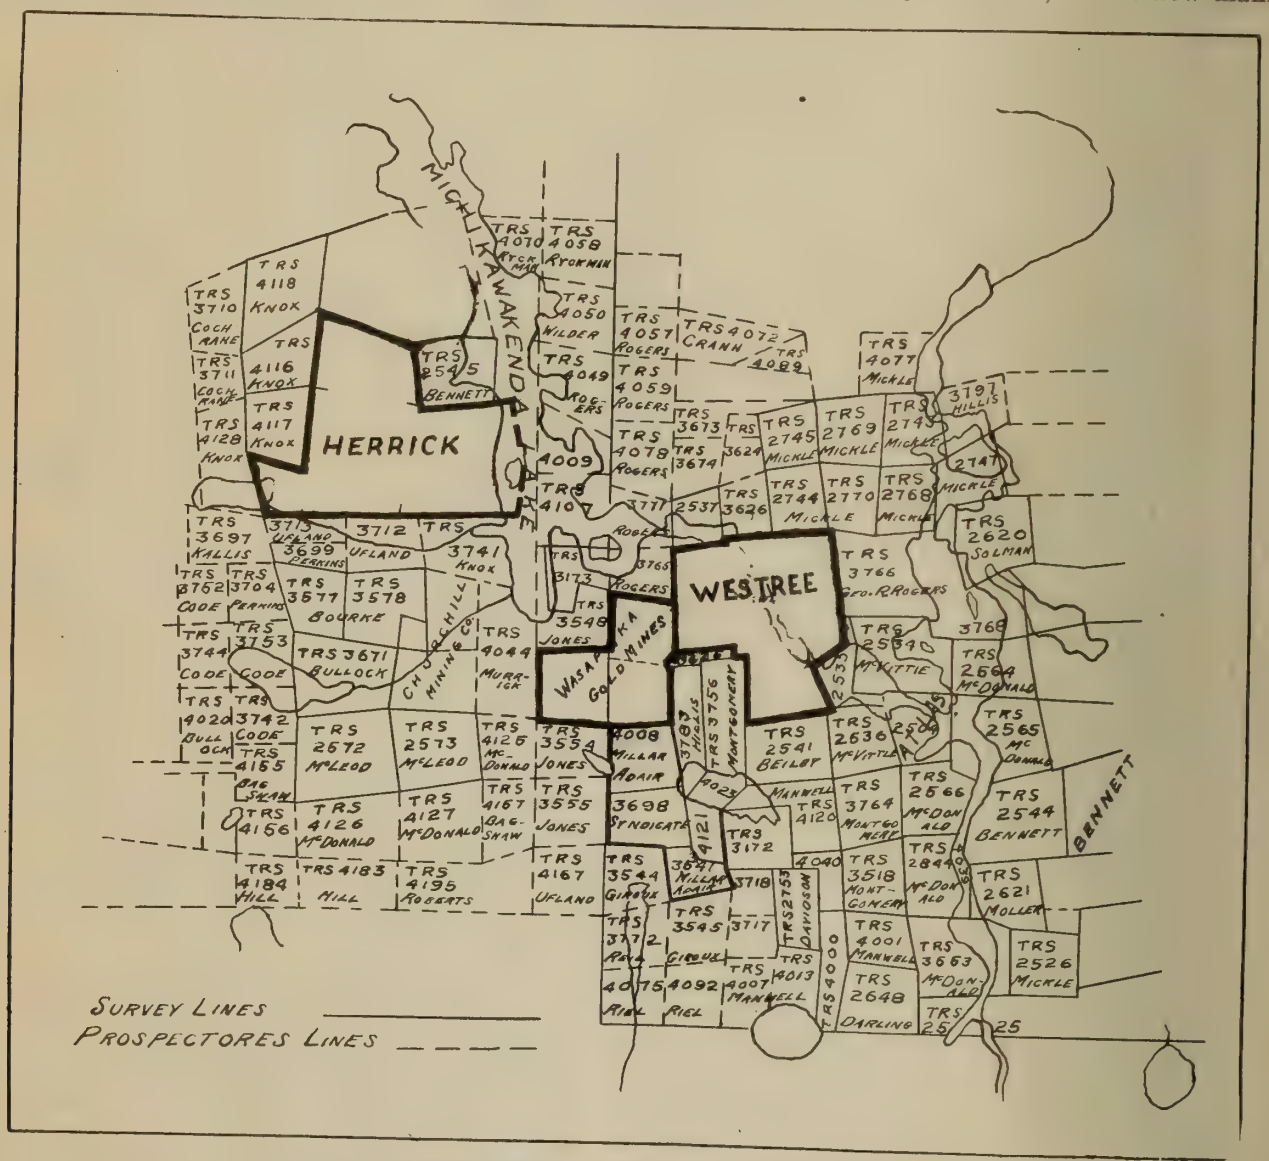
Sydney, N.S., July 7.—That the proposed five day working week will be inaugurated, beginning August 2nd, was the decision arrived at by the United Mine Workers' executive, in session at Glace Bay. Another decision of considerable public interest was the voting of the sum of $500 to assist the arrested Winnipeg labor leaders with the cost of their defence.

Plans are being made for a joint meeting of the steel workers of the Dominion Iron and Steel Company, and of the N. S. Steel and Coal Company, and the miners of the companies to discuss the advisability of asking the Government to keep these plants running. Things have come to the point where immediate action is necessary, and work is becoming slacker every day. At Sydney Mines the miners are working only two days of the week.

The Wasapika Gold Area

By REGINALD E. HORE.

In July, 1918, in company with Mr. George R. Rogers, president and manager of Wasapika Gold Mines, Limited, I visited the Wasapika and neighboring properties in Churchill and MacMurchy townships, Sudbury mining division, Ontario. Some account of the area was published in this Journal last August. I have recently revisited the area, and have again been very favorably impressed with its possibilities. Under the direction of Mr. Rogers, development work is being carried on at several properties in a way that is commendable, and is very likely to result in the making of gold mines in this little known, but much discredited area.



Sketch Map of Wasapika District.

In this article, I will give some account of my observations. The numerous photographs will help readers to visualize the area. Those who are particularly interested in the development of new fields will be able to appreciate what Mr. Rogers and his associates have accomplished. When he entered the area a few years ago many discoveries had been made, and hundreds of claims staked, but very little development work was being done. He carefully examined a large number of properties and purchased a few of them. On one of the most promising he did considerable surface work. After carefully sampling, he decided to develop the Ribble vein on what is now known as the Wasapika property. Like other pioneers who would develop mines in a new district he encountered many obstacles, notably transportation difficulties, but he stayed with it, and is now making mine at the Wasapika. He is also in charge of the development work on other neighboring properties, and is handling them in an able manner. No man can be certain as to the outcome of mining ventures; but the Wasapika area has promising ore deposits, and will in all probability become a profitable producing area if the properties are all handled in as capable a manner as those in which Mr. Rogers is interested. The making of a producing mine in the hinterland is something that arouses our admiration, and I need

not apologize to readers of this journal for prefacing my remarks about the area by recognition of the fact that it takes men as well as ore deposits to make mines. To the propectors who located the claims and to those who are developing the deposits the people of Ontario owe more than they realize.

The Wasapika Area.

The area which I visited, and which I am here calling the Wasapika gold area, is a part of West Shining Tree area. The Wasapika property is south of Michikawakenda (nice little pickerel) lake. The Churchill is west of the south end of the lake. The Westre, formerly known as the Caswell, adjoins the Wasapika on the east end and extends north across Upper Wasapika lake, which is fed by the waters from Michikawakenda lake. The water runs east of Upper Wasapika lake to Wasapika Lake—an expansion of the west branch of Montreal river. The Atlas property is at the south end of Wasapika lake, and from its rocky promontory one may look across Wasapika lake and down the Montreal river. A short distance up the river, and on the east bank, is the Bennett property. The Adair property is south of the Wasapika and the Foisey is further south. The location of all the properties mentioned is shown on the accompanying sketch map.

Means of Access.

To get within 25 miles of the Wasapika area is an easy matter. The Canadian National Railway runs north-easterly across the country at that distance. The most used stopping place is at Westree, formerly known as Kashbaw. It is at present only a flag station; but will doubtless be soon a regular stop. Quite recently the need of improving service has been recognized by the placing of an agent at Westree station. Trains leaving Toronto at 9.15 p.m. reach Westree about 10 o'clock the following morning. Returning you leave Westree about 3 a.m., arriving in Toronto about 4.30 p.m. the same day. These trains run three days a week, leaving Toronto Monday, Wednesday and Friday.

From Westree to Wasapika there is a good water route, on which motors of the Evinrude type are advantageously used. From Ruel there is another good water route. A day's journey by water brings you from the railway to Wasapika mine. The portages are short and well cut out. It is a comparatively easy canoe route, and, by use of motors, it affords access to the gold area without any great hardship. It is a roundabout route, however, and double the length of the road which runs in a fairly direct line from Westree to Wasapika mine. At present the river is blocked with logs near Westree, but this condition of affairs need not be tolerated for long.

In less comfort, but with a saving of time, one may reach Wasapika by road. At present wagons are used on this road for half the distance, but for the remainder the road is usable only in winter. The Government now has a party of workmen improving the road near Westree, and it is understood that an effort will be made to make the road usable for its whole length this summer. Attention is at present being directed to improving the first half. This is much to be desired, but there should also be now at work the second half of the road another party of workmen. Otherwise it will be impossible to take in any heavy freight during the summer. I am advised that this part of the road will receive attention very soon.

The present method of getting in supplies is to use the road for half the distance, and use the water routes for the other half. At the halfway, a stopping place where meals and prospectors' supplies can be obtained has been established by Mr. Borland, of Toronto. Freight is carried on wagons to the half-way by freighters, whose charge is about $1.00 per cwt. From the halfway to the mines the various companies bring their supplies by motor boats and canoes.

On the water route to Wasapika, the lake which has given the name West Shining Tree to the district, is crossed. Here is another stopping place, the West Shining Tree hotel, run by Mr. Cosineau. Mr. Cosineau's place is also convenient for those who use the road from Halfway to Wasapika. Few use the road in summer time, however, except as a trail. West Shining Tree lake is a large one, with numerous islands; quite picturesque, with numerous rock outcrops exposed here and there along the wooded shores.

In the vicinity of West Shining Tree lake there have been several gold discoveries made. I did not visit the properties, however, and know them only by hearsay. It is understood that some work will be done on at least one of the properties this year.

Leaving West Shining Tree Lake, we followed a little stream for a few miles, then walking over a well-cut portage, crossing a small lake, walking over a second portage, and then taking the boat down another small stream, we reach Okawakenda (Big Pickeral) lake, and thench Michikawakenda Lake and the Wasapika mine.

The character of the country traversed is well indicated by the accompanying photographs, and I need not describe it at length here.

The Wasapika Gold Mine.

At the Wasapika mine there has been installed since my last visit a plant well suited for development work. The shaft is being sunk in the hanging wall, a short distance west of the outcrop of the Ribble vein. The rock coming from the shaft is fine grained, grey colored and somewhat schistose. It is well mineralized with pyrite. It contains much fine grained carbonate mineral, probably a calcium-magnesium-iron carbonate, and sericite. White quartz is encountered here and there in the shaft. I must more carefully study the rocks and ores before venturing to describe them fully; but from my observations I have no hesitation in saying that the formation is favorable for gold deposits, and there may well be a large body of ore in the hanging wall of the Ribble vein. Further geological examination and sampling must be done as development proceeds. I regard the results so far obtained as very encouraging. The shaft is an advantageous position for the continuance of development work. A capable superintendent, Martin Hassett, is in charge of operations. If nature has been kind and has sprinkled enough gold in the hanging wall the Wasapika will be one of Ontario's big gold mines. It would be foolish to say that the gold is there in sufficient quantity. The development work is being done with the object of finding out whether that is the case, as well as to test at depth the Ribble vein itself.

Just here it might be well to distinguish between veins and ore deposits. The quartz veins in the Wasapika area are very narrow—a foot or two is a good width. The ore deposits are, however, not all vein quartz; but largely silicated rock. The ore deposits,

vein quartz and rock included, are themselves commonly not more than a few feet in width for any length, but they are a minable width.

At the Wasapika, where most of the development work is being done, it seems not improbable that the ore deposit will prove to be very much wider than the Ribble vein. Should the ore deposit prove to be only a few feet wide, it may yet prove very profitable, for surface sampling indicates a good grade of ore in the vein quartz, and the silicated schist enclosing the quartz. There is a reasonable chance that there may be enough gold in the silicated hanging wall to make a very wide orebody. It is unlikely that the grade will prove to be as high as the well defined ore deposit immediately along the vein; but it looks sufficiently promising to warrant careful testing. Fortunately the shaft has been so located that such testing can be done economically while exploration of the Ribble vein proceeds.

The accompanying photographs show the Wasapika power plant, head frame and blacksmith shop. Just south of the power house there is under construction a small saw mill building.

It will be noted from the photographs that the Ribble vein outcrops on the side of a hill, and that there is low ground immediately to the west of the quartz vein, which strikes north. The shaft is west of the vein, and a narrow wet depression lies between it and the vein. To the north from the shaft, as shown in one of the photographs, is another outcrop, on the western face of which the vein is again well exposed. Similar outcrops occur on the claims further north and south, and one cannot escape the conclusion that the Ribble vein marks out a major line of fracturing. It is not unlikely that good ore occurs in several places along this fractured zone. It remains for exploration to determine where the orebodies are. Obviously diamond drilling must be resorted to if the low lying places are not to remain unexamined. It would be strange if only the best parts have been left exposed. Developments at the Wasapika will help to furnish a key for exploration of the properties north and south. The diamond drill can be used to great advantage in such exploration. A series of short holes properly located would give very useful information. Correlation of the drill cores with the openings at the Wasapika shaft should give helful guides.

Millar-Adair and Foisey.

South of the Wasapika there are outcrops of gold bearing quartz on the Millar-Adair and Foisey properties. No development work has yet been done on these claims. They are promising prospects that demand exploration. The main showing in each case is a white quartz vein at the eastern edge of low wet grounds. They are fit subjects for the diamond drill. Holes started to the west of the line of these outcrops and driven towards the line might disclose important orebodies. There is no certainty that they will do so; but there is a reasonable chance.

The Northern Extension of the Ribble Vein.

North of the Wasapika property there are outcrops of the Ribble vein on claims owned by George R. Rogers. These properties are yet to be explored. A little stripping has been done, and Mr. Rogers states that his surface sampling has shown good values in several places. The claims merit attention, and they will doubtless receive it later on.

The Westree.

The Westree property lies on either side of a narrow lake which drains into Wasapika lake, and which for convenience I am calling Upper Wasapika Lake. The accompanying photographs show the location of the shafts and of the camp buildings with reference to the lake. Some of the photographs will help the reader to visualize the character of the country. Others show, at close range, the nature of the ore deposits. The properties were formerly known as the Caswell.

From the abandoned workings on the north shore of the lake a considerable quantity of rich ore was taken out by former owners. As far as can be seen there has been little development work done other than that necessary to remove a rich pocket of ore. One of the photographs shows the size of the dump, a fair measure of the amount of excavation work done. Extending northerly from the shaft there is a fissured zone. One of the photographs shows the fissured zone at the shaft, and another photograph shows similar fissuring at an outcrop a short distance north of the brow of the hill. Other photographs show the ore deposit at a second shaft on the south side of the lake. There is no big quartz vein in this fissured zone. The ore deposit includes more rock than quartz. In places the narrow quartz veins are very rich, and there is little doubt that some small high grade shoots will be exposed during development. The future of the property depends of course on the average value of the deposit over a minable width, and the result of development work under the lake. The individual veins are short as well as narrow, but there are several narrow ones in the fissured zone. The fissured zone is itself not strongly marked a short distance south of the shaft. The natural course in testing the property is to sink on the ore deposit at the south shaft and drive under the lake toward the northern workings. The prospect shaft is now being enlarged preparatory to sinking. Some of the quartz broken during this operation is liberally sprinkled with gold.

At this early stage in development it would be rash to make predictions, but there is a good chance that the Westree will prove up favorably if its owners are prepared to risk some money on systematic exploration. The property, like most mines in the early stage, would never be developed by anyone who was unwilling to take a chance. Under the direction of Mr. Rogers and his superintendent, Mr. Hassett, the development work will be, we feel sure, well done.

While attention so far has been chiefly directed to the immediate vicinity of the two shafts, there are numerous other outcrops on the Westree that deserve attention. There are quartz veins and fissured zones that warrant surface work being done on them. One prominent vein exposed at the east end of the lake will probably be encountered in the drive across the lake.

The Herrick.

The Herrick property consists of several claims on the west side of Michikawkenda lake. Since my last visit a shaft has been sunk to a depth of 50 feet on the Kingsley vein. This is one of what were formerly known as the Knox claims. The deposit was briefly described by the writer in the Journal in August,

1918. At the shaft the vein has a well defined vertical wall. The shaft has been timbered and the surface outcrop has been covered with rock in levelling around the collar. The dump shows the rock excavated in sinking the shaft to be a greywacke, a fine grained grey-colored sedimentary.

The vein matter is chiefly quartz with some calcite and small particles of pyrite. On the fracture faces there is a soft dull green mineral that looks like serpentine. There is a thin layer of pale brownish grey calcite on some of the fracture surfaces—evidently a secondary filling. The vein matter is said to show good values for a minable width in the shaft. Samples show high grade ore in the shaft for a width of 5 feet. Mr. Rogers, who is consulting engineer for the Herrick, has sampled the vein as exposed in the shaft. I am advised by Mr. F. C. Sutherland that the samples show high grade ore to the bottom of the shaft.

The Herrick ore deposit is a well defined vein. The surface sampling showed good ore, and the development work has exposed such ore to a depth of 50 feet. Further development work by shaft sinking and drifting may very reasonably be expected to prove up an excellent orebody. I understand that this work will be undertaken as soon as the necessary machinery can be taken in. Exploration by diamond drilling will be begun shortly. I look for interesting developments at the Herrick this summer, and will be surprised if development work does not prove similar ore at depth. Changes in rock formation accompanied by changes in character of the fissuring are to be expected as development proceeds.

The chances of making a small profitable mine at the Herrick seem very good. There is also a good chance that it may become a big mine.

Other Properties.

There are a number of promising properties in the area in addition to those I have mentioned above. I made brief visits to some of them—the Churchill, Queen of Sheba and the Bennett.

At Churchill some work has been done on a vein exposed along the southern edge of an andesite outcrop. The vein strikes west. The accompanying photograph shows two men at work cutting samples. I know so little about this property that I do not care to venture an opinion about it.

At the Queen of Sheba, north of the Churchill, there was no work being done. A few minutes spent at the outcrops showed a deposit of different character from those already described. The ore is red with iron rust, and when broken shows an abundance of fine grained pyrite. The rock is a felsite with the glassy appearance and clean fracture of the more siliceous volcanic rocks. In places it has been squeezed laterally into sericitic schists.

The Bennett vein, on the Bennett claims east of the Montreal river, is shown in the accompanying photographs. It is undoubtedly rich, and should be carefully tested. I have not seen the assay plan, but the presence of much gold is easily detected in parts of the vein. Some of the structural features, and the topography of the outcrop are indicated by the photographs. It will be noted that the location is very favorable for mining the upper part of the ore deposit, and that the deposit could easily be tested at depth by short diamond drill holes. At the time of my visit H M. Roberts and Wm. Smith were examining the property for the E. J. Longyear Company. The Bennett is the only property east of the Montreal River that I visited on this trip. The ore and wall rocks are of similar character to those at the Wasapika. The quartz vein shown in the photographs is enclosed in grey andesites. Near the shaft it is distinctly faulted. At another place it is crossed by a narrow basaltic dyke. In either direction along the strike are masses of diabase.

Among other promising properties in the area are the Atlas and Saville-McVittie. I have not visited these recently. A number of men are at work on the Atlas.

Present Surface is a Mere Incident, Not a Governing Factor in Life History of the Ore.

The gold in the ore deposits here described is certainly not present as a result of concentration at the present surface. I do not believe that the present rock surface existed when the ore was deposited in the form in which it is now found. The present surface has no genetic connection with the ore deposits, and there is no good reason to fear the bogey of "surface enrichment." The ore exposed near the surface is of a type that is formed at depth and similar ore may confidently be expected to occur for any minable distance downwards. I do not mean to suggest that values will be uniform. I don't know whether they will be lower or higher, but I do believe that the conditions are favorable for the occurrence of deep ore deposits in which ore of similar mineral composition to that near the surface will be found at any depth to which mining operations can be carried. The individual deposits will doubtless vary in depth as they do in length, but the present surface is a mere incident in the lives of these ore deposits—not a governing factor.

A Promising Area.

After a second visit to Wasapika I still regard the area as one of great promise. There are difficulties to be encountered in developing the deposits, for they are 25 miles from the railway and the roads are not yet in shape for use in summer. There is as yet no large amount of underground work done, and there is a chance that when done it will prove disappointing. Some of the properties need to be tested by diamond drilling before one may even guess at their value. There are many things to be done, and the result of doing them is uncertain; but the work that has been done has given results that should prove encouraging to those who are willing to risk something in a bold attempt to make mines in the wilderness. To such adventurers I would strongly recommend this area. The deposits are promising enough for the venturesome, but not yet sufficiently developed for those who think they cannot afford to or will not knowingly take a chance.

OTHER WASAPIKA VIEWS.

Second International Mining Convention, Nelson, B. C.

Reported by our British Columbia Correspondent.

The annual International Mining Convention of the Pacific Northwest was held on the 19th, 20th and 21st of June at Nelson, B.C., and was attended by representatives of the industry from all sections of the British Columbia Interior and from the State of Washington.

Hon. Wm. Sloan, Minister of Mines, was present and informed the delegates that it was the policy of the Provincial Government to offer every encouragement to Capital, it being appreciated that this was essential if the country's mineral riches are to be developed. Taxes might be considered high, but they were not as much so as in the neighboring States and the Government was looking forward to the time, which he trusted was not far distant, when assessment would be based only on net incomes.

One of the Convention's features was the announcement that the Committee appointed to investigate the charges against the Consolidated Mining & Smelting Company of placing its rates of treatment at such a figure as to impose a great hardship upon shippers of ore, had found the company "not guilty." This was followed by a suggestion from the company's officials that they and the independent shippers should get together to consider and settle their differences as well as to solve their joint problems.

There were a number of valuable papers, dealing with all phases of mining activity, and F. A. Starkey, the Convention Manager, and his Associates were congratulated on the able manner in which the event was organized and carried through.

First Day's Proceedings.

Organization of C.M.I. Branch for B.C. Interior.

The first day was employed in the organization of a branch of the Canadian Mining Institute for the British Columbia Interior. Mr. S. S. Fowler, Manager of the Blue Bells Mines, near Riondel, B.C., was selected to act as Chairman and explained that the purpose of the proposed branch was to give the mining men of the Eastern Districts of the Province a medium for the consideration of problems which were constantly arising relative to the industry and for the impression of their views, with the support and influence of the Canadian Mining Institute, upon those in authority in Government or otherwise. He was sure the importance of this would be recognized and that those associated with the development of the industry would co-operate in order that the move might be made a success. These views generally speaking were endorsed, and some suggestions made as to how the usefulness of such a Branch could be emphasized, by Dr. E. T. Hodge, Professor of Mining at the University of British Columbia, Ernest Levy, James Anderson and R. R. Bruce. It was pointed out that heretofore matters relating to mining in the Kootenays had been dealt with by organizations not directly affected and only indirectly interested. For these reasons it was decided, without opposition, to launch the new organization and the necessary formal steps were taken, officers being elected as follows: S. S. Fowler, chairman; W. G. Wilson, secretary; executive committee, James Anderson, Kaslo; Randolph R. Bruce, Windermere; A. G. Langley, Revelstoke; F. S. Peters, Rossland and S. G. Blaylock, Trail, B.C.

Other events of the day were of a purely preliminary character. The Mineral Exhibit, which was housed in a canvas structure on the main street of the city, was judged. This was a representative display of the mineral wealth of the Kootenay and Boundary Districts of the Province. Most of the well-known properties were represented and the variety, as well as the quality of the specimens shown, were the subjects of favorable comment by visitors. After the session to which reference has already been made a reception was tendered a body of delegates from various parts of the Province, including the Coast, who came by steamer up the Arrow Lakes. Nelson is situated on the West Arm of the Kootenay Lake, a chain of inland waterways from which rise very beautifully timbered hills and mountains. The citizens are enthusiastic yachtsmen, canoeists, and motor boat devotees. There is available, therefore, quite a large mosquito fleet and this was mustered to extend welcome to the incoming mining men. It cruised down the water, greeted the regular steamer with all whistles and horns procurable, and turning escorted her into harbor. It was a striking scene, as the rays of the sinking sun were reflected on the placid waters and the varied colors of the mountain and hill sides were thrown into relief, while the little craft churned their way into the quaint little City of Nelson, the mining centre of the interior of one of Canada's greatest mineral producing provinces.

Proceedings of Second Day.

On Friday, June 20th, the Convention got into full swing. The delegates about two hundred strong assembled at the gaily bedecked City Hill to listen to addresses of welcome from Mayor J. A. McDonald, who figuratively handed them the keys of the City. Hon. John Keen, Speaker of the British Columbia Legislature, was another of those called upon. Himself a pioneer among pioneers, one of the sturdy band who had a hand in the opening up of the Slocan District, a man direct in speech, uncompromising in his statement of fact, and possessed of a sense of humor which makes his public utterances features of all important gatherings of western mining men. Mr. Keen bade the delegates welcome in warm terms. He said that the City of Nelson admittedly was a delightful place and no doubt they would have a good time. But there was another city, which wished to be remembered—Kaslo, the Mother City of the Kootenays. For some reason she could not have the Convention and so was glad that it went to Nelson, her largest suburb. (Laughter.) The delegates could thank God that there were not living in the years 1891 to 1894. Then they did not have the learned geologist and the equally learned metallurgist to tell them when they were wrong. True these accomplished men did not tell them when they were wrong till after the event even today, but nevertheless their advice was available and unquestionably it was invaluable. (Laughter.) There were some of them present and he could assure them that what he said was not intended in any but a complimentary sense. To the visitors from Spokane and other points on the American side he wished to extend a special welcome. Their co-operation was always appreciated. They had done good work in

he past and would continue in the path of industry and irtue. It had been Spokane mining men who had done large part in the development of the Slocan in the arly days. British Columbians had never forgotten hat and the latters' sense of obligation had been so reat that they had turned around and constructed Spokane, one of the great industrial centres of the State of Washington. "Let us continue hand in hand," advised Mr. Keen, "remembering that the important things are to find and recover the ore and then obtain for it the best possible price."

Remarks of the Secretary A.I.M. & M.E.

L. K. Armstrong, Secretary A.I.M. & M.E., expressed appreciation on behalf of himself and associates, the majority of the City of Spokane, on the hearty manner in which they had been received. He declared that Mr. Keen's observations regarding Spokane were founded on fact and the fact was appreciated, generally, by the citizens of that city. He had heard it stated, and believed it to be true, that that City would be but a village were it not for the mines of the Kootenays and the Boundary of British Columbia. It was said that its extent and its business was about 80 per cent due, either directly or indirectly to the mining industry. The interests of the producers of the Province and of Spokane, therefore, were closely allied and he was sure that they would in the future work together in an ever larger degree than they had in the past. In closing he delivered a message of goodwill and regret at his inability to be present from Phillip M. Moore, former president of the American Institute of Mining Engineers, who had attended the last Convention in Nelson and recalled his experiences on that occasion with extreme pleasure.

L. O. Howard, of the College of Mines, Washington State College, spoke briefly, referring to his pleasure at being present and stating that he came, not to lecture, but to learn.

Joint Meeting A.I.M. & M.E. and C.M. Inst.

In the afternoon there was a joint meeting of the A.I.M. & M.E. and the C.M.I., Mr. Fowler occupying the chair. Three interesting papers were read as follows: "Mining Methods at the Granby Mines, Phoenix," by C. M. Campbell, E.M.; "Nodulizing Copper Concentrate," by Oscar Lachmund, E.M., Spokane, Wn.; and "Tunnelling Reminiscences," by Major Angus W. Davis. Summaries of the two former are subjoined while the reference suffices for the latter inasmuch as it was read before the recent annual meeting of the Western Branch of the C.M.I.

Mr. Campbell's Paper on Granby Phoenix Mines.

Mr. Campbell's paper was illustrated by lantern slides. He stated that the first of the camp's claims, the Knob Hill and Old Ironsides, were staked by Henry White and Matt Hotter in 1891. There followed a period of comparative inactivity, marked by intermittent development until in 1901 a consolidation of mining and smelting interests resulted in the formation of the Granby Consolidated Mining & Smelting Company. The first ore was shipped in July, 1900. Between then and June 14, 1919, about 14,000,000 tons were shipped. From 1910 to 1916 daily shipments averaged 3,000 tons; while in 1912 and 1913 the daily average output was 4,000 tons a day. Mr. Campbell went into the geological conditions of the district and enumerated some of the bigger problems which the company's staff had to overcome. He stated that the mining costs, were exceptionally low and that it was possible to win and to successfully treat very low-grade ore at a profit. Efforts were made constantly to reduce the costs with such satisfactory results that as conditions changed, and the methods in use failed to yield a profit on the class of ore being handled, there were new methods ready to further decrease operating expenditure to such an extent that mining could be maintained and divi-

International Mining Convention, Nelson, B.C., June 19-21st, 1919. Delegates outside Convention Hall.

dends paid. As an instance he mentioned that timbering costs were cut in two years from 34 to 4 cents and later to 2½ cents per ton. And this was done, it was stated, with increased safety to the men. Views were shown of the town of Phoenix, shipping terminals, of underground workings showing stoping methods, the filling of stopes with waste, and electric shovel operations.

Nodulizing Copper Concentrate.

The preparation of copper concentrate for the market, stated Mr. Lachmund is a problem that confronts the British Columbia producer today, assuming that it is the intention ultimately to smelt all domestic copper ores within the Province.

The only market for such material was some outside reverberatory smelting plant as there were no such plant within the province. This meant high railroad freight charges owing to the high moisture content of the concentrate, or an appreciable loss of fines in transit if the product is dried before shipping, to say nothing of the additional cost of drying. He said that as there were several glass-furnace smelting-plants in British Columbia the logical method was to put the concentrate in proper physical condition for blast furnace practice. Three methods were suggested, namely, briquetting, sintering and nodulizing. The first he did not think very satisfactory as briquettes did not lend themselves to transportation. Sintering the sulphides in roasting pans or pots, he declared, made an undesirable product for British Columbia blast-furnace practice as far as retaining the sulphur is concerned, it bringing the percentage down as low as five.

Taking up nodulizing, that is getting the fines into round particles or nodules by passing the material through a revolving cylindrical furnace or kiln under application of heat, he said that it had been successfully carried out at several large plants.

He instanced the United States Metals Refining Company at Chrome, New Jersey, which had used the method on a large accumulation of flue dust, and later on flotation concentrate. The copper concentrate of the Braden Copper Company in Chili as well as the flotation product was being handled through the rotary kiln.

After quoting a number of authorities, Mr. Lachmund, said that it appeared that nodulizing the fine ores, flue dust and sulphide concentrate is the solution of the problem of preparing this material for the market where reverberatory furnaces are not available. In fact under average conditions smelting the nodules in the blast furnace can be done more cheaply.

He told of the series of experiments which he was called upon, recently, to supervise in British Columbia. For the preliminary work, a sheet iron tube 12 inches in diameter by about ten feet in length was used, and this was not lined with firebrick or other refractory material as only small lots of concentrate were tried at a time and each test was of short duration. The results indicated that a certain amount of the desirable products could be made in this way, but the apparatus was too small and crude, and fuel control too uncertain, to keep it up for any length of time, and no tests were made as to sulphur elimination, as the main object was to ascertain whether nodules could be made. Having determined this, the process was tried on a larger scale, the plant of an idle cement works being used. This consisted of a cylindrical revolving furnace 125 feet long by 7 feet in diameter inside the fire brick lining and a coal crushing plant, the fuel used being powdered coal.

In telling of this experiment, Mr. Lachmund said that he had never heard of powdered coal being used for nodulizing copper-sulphite concentrate and consequently he and his associates were not very sure of themselves. It appeared to them that fuel oil was out of the question, the concentrate available being limited and the plant not being arranged for burning fuel oil. However, the former Superintendent of the works was familiar with coal dust firing and the experiments were initiated. It was discovered in the first place that the temperature required to be lower for making nodules from concentrate than it did in the dry process cement practice of calcining clinker. The burner was too large and the fuel feed difficult to control, the result was that there was produced everything from fine roasted dust to lumps of partially smelted material as large as a man's fist. However some good nodules were made which seemed to him to show that powdered coal could be used successfully as fuel providing that proper equipment is used. He said that coal dust firing was being used at reverberatory works and also under boilers of various types and that a similar arrangement no doubt could be worked out for a nodulizing kiln.

Dealing with costs he said it was impossible to obtain favourable working conditions always and the total expense could not be charged against the operation. An effort was made to obtain representative cost figures when the kiln was doing good work, but they were more or less estimates. Between 12 and 14 tons of concentrate were treated with one ton of coal. He figured the coal at $5.00 per ton pulverized and in the bin, and thought the cost of concentrate nodulized should not exceed 50 cents. To these figures, however, would have to be added overhead and other expense items amounting to about 50 cents perhaps, and making a total of $1.00 per ton. He said that the capacity of a kiln 125 feet long such as had been used in these experiments should be about 100 tons of concentrate a day.

In closing, Mr. Lachmund commented on the rapidly gaining popularity of powdered coal as fuel and asserted that this should result in making certain so-called semi-lignite coal of Western British Columbia of commercial value. He also surmised that any future discoveries of large copper deposits in this province probably would be of so low a grade as to require water concentration. It would therefore be necessary to ship the concentrate to a smelter and he did not think that anything could be more desirable than the installation of such a plant as would permit the driving of the moisture from the product and as much sulphur as was undesirable. Not only would this give the smelterman a very attractive material for his plant, but would save the operator substantial freight charges.

Consolidated Smelter Charges—Committee's Finding.

Mr. Fowler explained that, as Chairman of the Committee appointed to investigate the justice or injustice of the charges levied by the mangement of the Consolidated Mining & Smelting Company on custom ore treated at the Trail B.C., Smeltery, he had been asked to give a summary of the Report of the committees which had been forwarded to the Minister of Mines at Ottawa. He recalled the circumstances attending the appointment of the Committee which included James Anderson, of Kaslo, B.C., and Ivan DeLashmutt and himself. Something over a year ago the Consolidated Mining & Smelting Company announced that conditions made it essen-

tial that a new schedule should be applied to ores received for treatment. Following this "Schedule B." was issued imposing higher rates on lead ores. Considerable dissatisfaction was manifested by operators and mining men generally and the company became the subject of such criticism that the matter was taken up by various public bodies, among them being the Board of Trade for Eastern British Columbia. Representations to the Dominion Government at Ottawa finally led to the endorsation of the proposal that an investigation be instituted and the Committee as indicated had been authorized to proceed with the work.

The inquiry had been pushed forward with all possible expedition and the Committee had been given every possible assistance by the officials of the Company. Mr. Fowler emphasized this point. It was a matter of satisfaction to him that the company's books had been thrown open to the members of the Committee without reserve and nothing withheld.

The conclusion reached was that the company was justified in the increases enforced at that time. It had been justified, in the Committee's opinion, because it was shown that the smelter had not been making a profit. What profits were made were coming, not from the smelter, but from the mines, the property of the company and operated in connection with the smelter. There had been a time, it was true, when the smelting as such had been profitable. That was when there was available, close in and around the plant, ore of exceptionally high quality, among which could be instanced that of the Saint Eugene Mine. This, however, had become exhausted and conditions had gradually and completely changed. With the exhaustion of this mine it had been necessary to develop some permanent source of supply of ore for the smelter, a source which could be depended upon. The smelter management considered that it now had accomplished this in the Sullivan Mine.

Then there were to be considered the increased costs both of material and of labor. But, aside from the question of costs, as the market quotation on silver began to go up the quantity of zinky silver-lead ores received for treatment increased. The ratio of lead to zinc for satisfactory smelter handling should be about 9 to 1 in the slag but this, it appeared, was far from being the situation in which the company found itself. Their action, under the terms of "Schedule B.", made its effect felt in 1918 and on September 30th of that year it was found that the ratio of zinc to lead in the ores received had been reduced by approximately 50 per cent. It followed that the conditions in the furnaces and generally were much improved. Metallurgical experimentation with these ores had been in progress in the interim and, as a result, he was able to state that the company now was engaged in the preparation of "Schedule C." which, he understood, would mean a reduction of about $3 a ton on the average custom ore treated. This meant approximately $120,000 a year. He would not say that the company was giving it to the operators, or to those to whom it would go. The company could afford to take this action, or else it would not undertake it. But it was an evidence of its good faith. He thought the new schedule would be effective as from the 1st of July and believed that the change would be appreciated by the mining fraternity of Eastern British Columbia.

Remarks by Smelter Officials.

Mr. Bingay, of the Consolidated Mining & Smelting Company, said that he thought it was generally understood in 1918 that when the smelter solved its zinc trouble those ores which had been affected by the increase would have the load relieved. There seemed, he said, little appreciation of the fact that at the time these increases were announced there were decreases in charges on certain class of ore used for the reducing of large zinc contents. With improved metallurgical methods, and the use of these diluting ores, it was possible to state that another schedule was in preparation which would be issued very shortly and go into effect without delay. He was not prepared to go into details. These were to be discussed and decided upon at a meeting between himself, other officials of the company, and the members of the investigating committee. There was no doubt, however, that there would be reductions. It was the intention to inform each shipper to Trail by letter of how the proposed changes would affect his particular class of ore, so that all would know just where they stood and there would be no reason for misunderstanding.

General Manager Suggests Co-operation in Marketing Zinc.

Mr. J. J. Warren, the Company's General Manager, made a plea for closer co-operation between the company and the shippers of the Province. He said that Mr. Blaylock informed him that the company would be producing shortly 75 tons of zinc a day. The Canadian market was 40 tons a day. What was going to happen to the other 35 tons and what was to become of the product of the independent shipper? There was only one solution, namely, the search for foreign market and the acceptance of lower prices. The point could not be evaded. It was the company's policy to share fairly and evenly the Canadian market with the independent man, and it wanted the latter to show a willingness to share with it the loss resulting from the lower prices obtained outside the Dominion. It was the same with regard to lead and copper. This was a reason why he thought it in the interests of both to come together for a discussion of matters generally relating to the industry. There not only was the question of market but other common problems such as duties, embargoes, labor, etc. All of these, and many others, affected both the company and the independent shippers. It was in their interests to get together and to cooperate. Now that the company had been given more or less a certificate of good character he thought this might be arranged. He did not favor Government ownership and did not think it would be a good thing for the industry to have a Government official, who probably knew nothing about it, at the elbow of the management giving instructions as to how the smelting should be done. The company was not going to be satisfied until the Trail plant was made the best of its kind on the American continent in point of efficiency and of service. It was faced with all manner of difficulties. The attaining of such a goal would require the patience of a Job and the persistence of the Devil. But the company had them both. (Laughter.) "Now," he concluded, "I have presented the olive leaf, or rather the olive tree, you may accept or reject it."

Nicol Thompson, of Vancouver, B.C., and R. R. Bruce of Windermere, commended the Committee on its work. They also endorsed the suggestion that the Committee should be made permanent. That such was proposed had been indicated by Sidney Norman, of Spokane, in the course of a few remarks in which he expressed his gratification at the conclusions reached by the investigators and hoped that the Government would continue in office a Commission, the duties of which

would be to keep in touch with the smelter management and act as an intermediary between it and the shippers. He, and the majority of those who expressed themselves, thought the idea a good one, Mr. Bruce asserting that only in such a way could it be hoped that the good relations between the two would be preserved and without such good relationship the mining industry would be much handicapped.

Third Day.

Mr. Camsell on Geology of B.C. Gold Deposits.

When the Convention reassembled on the morning of Saturday, June 21st, Mr. Nicol Thompson, Cahirman of the Bureau of Mines, Board of Trade, Vancouver, presided and called upon Mr. Charles Camsell, of the Dominion Geological Survey, for an address on geological features of the gold deposits of British Columbia.

Mr. Camsell first commented on the falling off of production and the reasons therefore as commonly understood and pointed out that this was found so alarming that a commission was formed in England to discuss the problem of aid to the industry and in America proposals were made either to increase the value of an ounce of gold or to grant a bonus to producers. He spoke of the opinion of some students of political economy that it made very little differ-

From the hills above Nelson, B.C., with the Kootenay Lake in background.

ence how much gold was produced as long as there was sufficient production of other things. This matter had been discussed at meetings of the Canadian Mining Institute and the speaker thought that among mining men the opinion was unshaken that it was very necessary to produce more gold.

Mr. Camsell quoted statistics of world gold production during the last few years and said that the influence of war and the high cost of mining had had the same effect in British Columbia as in other countries. This was best illustrated by the actual figures, which are:

Gold Production of British Columbia.

1915	$5,937,934
1916	5,167,834
1917	2,863,190
1918	3,558,895

He explained that the increase in 1918 over 1917 was due to one new mine which had not before produced, the Belmont Surf Inlet Mine. This unsatisfactory condition was, in the opinion of many familiar with the extent and possibilities of the province, only temporary. Continuing, Mr. Camsell said, "It is not exactly safe to argue because each mile of the Cordilleran chain to the south of the Dominion has produced so much in mineral wealth, that an equal amount per mile will be found in the Canadian portion. H the difference is as yet so great and so much of country remains to be prospected that we can w afford to feel that our production in gold as well as other metals must increase until the difference i mile is greatly reduced. This and other conditio therefore, lead one to believe that as soon as ind trial unrest is settled, we will have reached the dow ward limit of gold production in this province a any change will be for the better."

The same was not considered to be the prospect the United States, according to some of the b authorities, but it was being urged there as a patrio duty to produce gold in spite of difficulties and d couragements in order to maintain their gold reser and the credits based thereon. "The same duty," M Camsell said, "devolves on Canadians and I wou earnestly urge prospectors to devote more time a effort to the discovery and development of gold d posits."

Age of B.C. Gold Occurrences.

Having made a few observations relative to t geological occurrence of primary gold deposits on t North American Continent, the speaker stated th practically all of the gold deposits of the province b longed to the second or younger period of mineraliz tion and that the whole production of gold is ma from these deposits. They were all believed to closely related to the great intrusions of plutonic roc that took place in the Jurassic period, and were for ed at the time of intrusion or shortly afterwards. Som of them appeared as contact metamorphic deposi formed on the border of the igneous bodies, but mo of them occurred as veins both in the igneous and the intruded rocks in a zone surrounding the igneo bodies.

"No workable gold deposits have been as yet d veloped," he said, "in British Columbia whose orig may be attributed to the early Tertiary period su as are found in Colorado, Montana, Utah and Idah or to the later Tertiary as the Bonanza deposits Nevada and portions of the adjoining States and Mexico.

"From 65 to 75 per cent. of the gold produced in th Province of British Columbia is obtained from th smelting of copper ores, but in describing or discus ing gold deposits in this paper we only propose t consider those deposits in which gold is the princip metal obtained. Placers too need not be considere since they are secondary and derived from erosio from the primary deposits."

Mr. Camsell then dealt fully with each of the gol bearing districts of the province, and in concludin advised that in searching for gold a district shoul be selected where it is known to occur in lode form or where the streams carry placer gold.

Mr. Sloan, the Hon Minister of Mines, addressed th Convention.

Hon. Wm. Sloan, Minister of Mines, who was we received expressed his pleasure at being present a such a representative gathering of the mining men o the Northwest. There was no doubt that the City o Nelson was one of the most charming communitie of the Provincial Interior. He had enjoyed his vis and wished to acknowledge the hospitality of whic he had been the recipient at the hands of the citizen and those associated with the Convention. In this con nection he mentioned particularly Mr. Fred Starke the manager, and his associates. He congratulate

the former upon the able manner in which the arrangements had been carried out. As Minister of Mines he also extended greetings to the delegates who had come from the south of the line. As has been noted at a recent similar Convention it was pleasing to observe the interest manifested by the mining men of the neighboring states in the development of the minerals of British Columbia. Their co-operation was welcomed and appreciated. They had fought shoulder to shoulder in France in the settlement of the great problem of the ages, namely, the maintenance of democracy, of free government by the people, and now were prepared to face shoulder to shoulder, the problem, almost of equal importance, of restoring settled conditions and developing the illimitable resources of America.

There is, as you are all aware, a condition of unrest in Canada, as well as in other countries, at present. I want to say that this is not an uncommon manifestation after the disturbance of such a war as that through which we have just passed. Rather it is what might have been expected, inasmuch as it has been the experience in Great Britain, although perhaps not quite to such an extent, after previous and comparatively recent wars. In my opinion it will not be very long before the life of the country becomes normal. Certainly it must regain its equilibrium if we are to take up the work of our daily lives and continue along the lines of industrial development and general progress. Looking back it is gratifying to remember that the British Empire always has emerged from conflicts greater and stronger than ever before. Moreover, the various outlying parts of our Empire, through the trials of the past four years, are not more closely welded and more determined to stand together than at any time in their history.

Provincial Government Aims to Stabilize Industry.

The aim of the Provincial Government, to pursue the subject of conditions and their settlement, is to establish the best of relationship between Capital and Labor. Only by so doing can it be hoped that the best results be obtained in the development of our natural resources and this refers in especial to the great milling industry. The mining business is more or less a precarious one and it is appreciated that capital must have all reasonable assurance that it will receive consideration when placed in legitimate enterprise. When in New York recently I had many inquiries as to the situation in this province and the prospects for profitable investment and am therefore certain that, as soon as the industrial unrest to which I have referred and of which we all are so painfully aware subsidies, we shall be able to take up the work confident that ample capital will be available. It is a matter of outside comment that the mining laws of British Columbia are fair and just, and of such a character as to encourage the capitalist to find in the development of its minerals as safe a field for investment as is to be found anywhere. In the matter of taxation I may say that the policy of the government is to base its assessment to a constantly greater degree on net incomes alone. At present, unfortunately, there are not enough considerable net incomes to make this possible and to pay the bills. That, however, is what we have in mind and those of us who are complaining of high taxation should remember that it is still higher in the adjacent United States.

Government Ore-Testing Plant.

While in Ottawa I took up with the Hon. M. Burrell, Minister of Mines, the matter of the establishment in British Columbia of an Ore Testing Plant.

It is not necessary for me to say much to the mining men of the Nelson District of the necessity for such an installation. There has been an agitation for one here for many years. Mr. Burrell informed me that it was the Government's intention to begin work on such a plant, the required finances having been provided by the Dominion Parliament. It was undecided at the time whether it would be placed at Nelson or the Coast, it would be proper that it should be made an adjunct of the University of British Columbia. Personally I should have preferred that the province have a School of Mines, but we have embarked on a more ambitious enterprise, namely, the establishment of a University that will be a credit to this great western country. But I know of the difficulties experienced by mining operators in this section because of the lack of such facilities for the determination of what class of mill should be provided for the treatment of their various kinds of ore and there is no doubt that an ore-testing plant is a necessity in this district.

It is interesting, in touching on the complexity of some of our ores and the consequent difficulty experienced in effecting full recovery of their values, to recall a statement made in Nelson a few weeks ago in the presence of the President of the Canadian Pacific Railway, Mr. Beatty, by Mr. J. J. Warren, the General Manager of the Canadian Consolidated Mining & Smelting Company. He stated that Mr. Blaylock, of the company's metallurgical staff, and his assistants had discovered a process by which silver, lead, and zinc can be recovered from the Sullivan Mine Ore. He also is reported to have said that the problem of the treatment of the low grade gold-copper ores of the Rossland Mines had been solved and that within a short time the Rossland Mines of the Company would be turning out between 2,000 and 5,000 tons of ore daily.

I sincerely trust that I have correctly interpreted the purport of these statements. The first should mean much to the operators of properties, of which there are not a few with ore similar generally to that of the Sullivan Mine. The second should result in the bringing to the historic mining camp of Rossland that prosperity which she had enjoyed for so many years and which we all are interested in seeing continued.

In referring to this improved process I may say that while in Brooklyn recently I was interested in witnessing in operation a new flotation process, known as the alkaline process. The experiments appeared to show that oil could be satisfactorily supplanted by alkali, by the method for which patents have been secured. Those controlling this process have informed me that they are coming to British Columbia to demonstrate it in the treatment of some of our complex ores, and it will be interesting to watch the results of this work.

Iron and Steel Industry in B.C.

With respect to the Iron and Steel Industry to which as Minister of Mines I have devoted much attention I may say that we have on the Coast and elsewhere large deposits of magnetite ores. These are of exceptional purity. We have been handicapped by the lack of hematite and for that reason I was struck with a specimen of red hematite in the Nelson Exhibit. I have given instructions to the District Engineer to examine the property from which this sample was taken and to report fully. As to what has been done,

must if you are familiar with the Bounty Act passed by the Provincial Government grant a bonus of $3 a ton on pig iron produced in the province from local ores. This so far has not given the results hoped for. Our action was followed up by an investigation of the possibility of the development of our iron ores by electric smelting, and Dr. Alfred Stansfield, an authority, was commissioned to come to the province and report. This he has done, and his report indicates that our magnetites can be so treated, but that the cost of power stands in the way of making the enterprise a commercial success. Recently an electric-smelter expert came to the Government and stated that he had an improved method by which it would be possible to treat our ores more economically. As the Government is much interested in this possibility a small grant was made in order that this method might be demonstrated and the results of the experiments will be known at an early date.

Government Aid in Construction of Roads and Trails.

When taking the office of Minister of Mines one of my first actions was to introduce the Mineral Survey & Development Act, dividing the Province into six mineral survey districts, each of which districts was placed in charge of a competent engineer. The duties of these engineers were to aid the prospector and the operators in every way, and I believe the policy has proved satisfactory. Among their responsibilities is the examination of such properties or prospects as require trails, or roads, to facilitate development. If the reports of our engineers indicate that the properties have merit and should be encouraged the Government authorizes an appropriation to aid in the furnishing of means of transportation. In this work we have spent $207,535 in a little over two years, built 98 miles of mining roads, overhauled 437 miles of mining roads, built 75 miles of trails, and overhauled 420 miles of trails. The only complain I have received, as a matter of fact, is that the engineers have been unable to cover their districts thoroughly enough and this refers particularly to the district in which are the East and West Kootenays. So marked is this that I have come to the conclusion that your district engineer, Mr. A. G. Langley, must either have expert assistance or that the district will have to be divided into two. (Applause.)

The outlook everywhere in a mining sense is bright. As I have said, Capital is looking to British Columbia for investment. This is strikingly shown by the number of properties which have changed hands in the Kootenays, as well as the dealing which has been going on at Coast points. The industry generally appears to be in a very healthy condition. It remains for those directly interested to pursue their work energetically and along legitimate lines. The country possesses the natural wealth. It is the duty of the people to develop it in such a way as to contribute to the commerce and industry of the Northwest. If this policy is followed the confidence of those looking for profitable mediums of investment will be maintained and there will be no difficulty in obtaining capital.

Increase in Value of Mineral Output of Province.

Last year, when the mining industry did not flourish as it had done generally, British Columbia's mineral output in value was $41,083,093, an increase over 1917 of $4,072,701, or 11 per cent. This is particularly gratifying when it is remembered that decreases were reported from the States of Utah, Nevada, Idaho, Colorado and California. It was not the time, however, to look back upon the past. Mining men should look forward. Not only is metal mining in the happy position of an assured future, but the gold producing districts of the Province having been mentioned, I want to say that it is significant that there have been of late many applications at the Department of Mines for placer dredging leases. There is no doubt that there is to be revival of this form of mining on the placer grounds of the Cariboo and other northern sections of the Province.

Mining Flotations Must Be Legitimate.

But it is essential that we as mining men should beware of the "wild catter." Under the Mineral & Survey Act I have authority to check such propositions as may seem, on investigation, to be of such a character. I may say that there is no objection to a company with a prospect issuing a prospectus which paints in fairly rosy colors the future of that prospect. But it is our determination that money obtained by the sale of stock shall be spent in the development of the propery in question. It must be recognized that capital is needed at the beginning of the opening of every prospect and that those most promising not infrequently turn out differently on development. The biggest propositions must have a start, but those who put their money into them at the beginning must have fair treatment. Briefly it should be the duty of us all, in the interests of the public, to see that the mineral and not the public is mined.

Revival of Local Treatment as Regards Flotation by Dean Francis A. Thomson, of the College of Mines, Moscow, Idaho.

Dean Thomson stated that it was not his intention to hold very closely to the limits of the title inasmuch as it was his desire merely to touch, generally, on the development of the smelter and the rapid improvements being introduced constantly through advances in metallurgical methods.

It was not many years ago when throughout all the mining States and in British Columbia there were numerous little smelters. They had been dotted all over the landscape and their remains still were to be seen, a somewhat dismal reminder of the past. It had been discovered through experience that it did not pay for a single mine, small in its output, to attempt to maintain a smelter. This experience resulted in a combination of properties for the maintenance of the smelters to handle their joint production. The change was found to work admirably. The method then was carried further and we have the present conditions of very large smelting plants handling the product of considerable mining districts.

Revival of Small Individual Treating Plants at Mine Site.

It was Dean Thomson's opinion that another step in the process of evolution was about due, and in this connection he referred to the very rapid development, and to the wonderful achievements of hydro-metallurgical methods. He spoke of some of the things that already have been done along this line with particular reference to silver, lead and zinc and expressed the opinion that all this was but the beginning, and that some remarkable advances were probable in the not distant future. The time was coming when we would lose the period of consolidation in regard to smelting, and go back, in a measure, to the small installation at the mine. His theory was that the ore would receive treatment at the mine metallurgically, after which it would be shipped to the smelter for refinement. He did not want it to oe taken that he held the opinion that the day of the smel-

ter was drawing to a close. That was far from his view of what the future holds in store. But he did want to make it clear that successful metallurgical experimentation was bringing about important changes in the method of treating ore particularly the peculiarly complex ores such as are found in the Kootenay and Boundary Districts of British Columbia.

Dr. Hodge Speaks on the Iron & Steel Industry of B.C.

Chairman Thompson called on Dr. E. T. Hodge, Professor of Geology, University of British Columbia, who took for his subject the iron and steel industry in British Columbia. He said that as it was admitted, apparently, that nothing could be of more benefit to the Pacific Northwest than the development of its magetite deposits. It was strange that some action had not yet been taken. The natural resources were available. There had been considerable discussion as to the quality of the ore as well as in regard to its quantity. As to the latter point there was no doubt that there was sufficient available to supply a fairly good sized plant for fifty years. In regard to the matter of quality the ores of British Columbia were magnetite for the most part. Of these deposits there were many. It was possible that some of the magnetites of the Northwest would be difficult to handle because of their copper contents, but this was no longer a serious problem, inasmuch as it has been proved that copper was not a detriment to steel. There was no doubt however, that for the most part the British Columbia iron ores were exceptionally pure, and the only question of a serious nature that he could see was whether it was more desirable to adopt the electric smelter or abide by the old blast-furnace practice. For his part he was of the opinion that the blast-furnace was of the most service in an industrial way and that electric smelting as a main factor in a large iron and steel industry was not yet established.

It having been established that the ores available of the required purity, it was well to glance at other features in the consideration of such an enterprise. Plenty of good metallurgical coke could be secured. It was said that the coal of Vancouver Island was not desirable, but he doubted this. Vancouver Island coal has been subjected to some experiments and he did not think that it could be definitely said that it was not good coking coal. Certainly, however, the coal of the Nicola Coalmont-Princeton Valley was a fine metallurgical coal. In fact, there could be none better. Coal dust, too, had been used to advantage in the blast furnace, so that there did not seem to be any cause for doubt in respect of fuel.

There was lots of flux. Many belts of first class limestone existed in British Colmbia. There was fluorite, a large deposit of which has just been opened by the Canadian Consolidated, and there were refractories. Everyone had heard of the magnesite of the State of Washington, which unfortunately now appeared to be inactive owing to the European situation. There also were good deposits of a similar nature in British Columbia. He knew of one in the Cariboo District a short distance from tidewater. Chrome, too, was found in this Province, there being deposits at Cascade and on Scotty Creek. Manganese had been found close to Kaslo and on Vancouver Island. It, therefore, would appear that those minerals necessary for purification purposes were present in the Northwest in ample quantities. It was apparent from what he had outlined that there could be produced without difficulty such alloys as Ferro-Chromite, Ferro-Magnesite, Ferro-Silicon, and Ferro-Tungsten. In regard to the latter, Dr. Hodge said that he had knowledge of deposits of scheelite in the Cariboo District.

In short, the speaker declared that it was his opinion that the time for talk had passed and that for action had come. A plant should be established, he said, of from 200 to 300 tons per day capacity. Perhaps there might be some difficulty as to labour but Pittsburgh had started without trained men and had succeeded. There were a great many mechanics employed in the shipyards and it was possible that some of these might be available. In regard to the market he did not think that there would be any difficulty in finding or developing enough to take care of the production of such a plant as he had in mind. For instance there is an exceedingly large tonnage of sheet iron used for canning purposes in the Pacific Northwest. Moreover, too little attention was given to the possibilities of the Oriental trade, from what he had been able to gather, the accounts commonly heard of the extent of the Chinese iron deposits were exaggerated. It seemed to him that the Pacific Coast had an opportunity of developing a large trade intercourse with the Orient.

Desirability of Bonusing Steel Manufacture Urged.

If the possibilities were as stated how was it that no company had as yet embarked in the industry? The explanation, Dr. Hodge thought, lay in the very large amount of capital which would have to be invested and the fact that it would take a rather lengthy period before the industry was established on a paying basis. An iron and steel industry, he declared, should be treated by the Government in the same way as a railway. Railways were bonused or subsidized by the Government because they had the effect of opening new country, bringing about development, and materially aiding the advancement of an unexplored country. Why not apply the same principle to a steel industry? It was in much the same position. Much capital was required to start it and some years would have to be spent in putting it on its feet but, when it was established, the result in the employment of men, in the initiation of subsidiary industries, and in the general welfare of the country was inestimable. He believed, for these reasons, that the British Columbia or the Dominion Governments, or both, should subsidize the industry in this Province, just as they had done various railways. What had been done in the way of bonuses, etc., did not go far enough. If there was further delay others would seize the opportunity which, there was no doubt, was available at the present moment. (Applause.)

Some discussion followed. Mr. Armstrong, of Spokane, thought that there was an important future for electro smelting in British Columbia and Washington, because of the variety of the rarer alloys which they had been found to possess. Mr. Thompson, of Vancouver, emphasized the purity of the magnetites of British Columbia which were low in sulphur and without copper for the most part. As to magnesite, he said that Dr. Hodge had neglected to refer to the very large deposit of it at Atlin, B.C. He was sure that there were 1,000,000 tons of first-class hydro-magnesite lying on the surface a short distance from the town of Atlin. Rock Magnesite also occurred in that section. Mr. Thomson spoke of the bounties which had been offered by the British Columbia Government on pig-iron produced locally and to the efforts which had been made to induce the Dominion Government to do something to assist those who might contemplate launching an iron and steel industry.

"Platinum and Other Minerals Found in the Ultra-Basic Rocks," by William Tomlinson, E.M. New Denver.

Mr. Tomlinson on the staff of the Munition Resources Commission in Canada during the war, directed his talk to the prospectors entirely. He spoke of the peculiarities of chromite, molybdenite, tungsten, platinum and others of the rarer metals. There were deposits, or indications of all those named, as well as of others, in British Columbia. The trouble, he stated, was that the average prospector did not recognize them when he saw them. It was more than likely that he would walk right over chromite, for instance, and systematic education of the prospectors was required. Mr. Tomlinson recounted his experiences in the Franklin Camp and the finding there of platinum in place. Mr. Tomlinson concluded with a very strong plea for government assistance on behalf of the prospector. This duty had been neglected in the Northwest to such an extent that there were few men, comparatively speaking, going into the hills. In California alone had he found the educated prospector. The men he had seen there were hard to deceive when it came to the appraisement of mineral. There was no reason why such a condition should not be developed in B.C. and he recommended that mining schools should be opened in the different mineral districts during the winter months. This would enable men to employ their idle time in acquiring knowledge and fitting them for the summer's work. He also expressed the hope that all the District Mining Engineers would place exhibits of the rarer minerals at their headquarters for the benefit of prospctors and others.

"Straight Talk" From a Veteran.

J. J. Mulholland, a pioneer prospector, gave what was entitled a "straight talk." He briefly outlined his experiences in the wilds of the Northwest and referred to the future of the great unexplored northwest section of the province in a mining sense as being full of promise. He thought it likely that there would be found another Klondyke somewhere along the great rivers of the Peace River and adjacent districts. It was his intention, in fact, he already had completed plans, to conduct an expedition into the Mackenzie River Country. Of course, the great difficulty, even if a strike were made, was that of transportation.

During the last few years there had been comparatively little prospecting and the reason was hard to find. It was true that the prospectors were given little encouragement. In the old days it was not hard to obtain a grub-stake, but now if a miner asked a merchant for one it was likely that the latter would express doubts of his sanity. The construction of trunk trails into the unexpected areas he thought was a desirable move, because there was no doubt that it was extremely hard to travel through the heavily wooded and mountainous frontiers of this province. The teaching of mineralogy and geology in the public schools would help and he thought that each Mineral Survey District should be provided with a map showing its topographical peculiarities and the mineralized zones.

Illustrating the results of prospectors working in the darkness of ignorance he said that 30 odd pounds of high grade tin ore had been found in a prospector's shack in Northern British Columbia. This prospector had had the ore assayed for gold and silver and, having got an unsatisfactory return, paid no more attention to it. Subsequently this man had died in the Yukon. Efforts had been made to find the deposit from which these samples came without success up to the present.

Prospectors, should be able to get reports on their prospects from the Government Mining Engineers; they should have assaying done free of charge; and should have the benefit of winter schools. He also advocated that the price of powder to miners be reduced and that the duty should be taken off mill machinery, inasmuch as the greater part of this was imported from the United States.

Summary Review of Mining and the Distribution of Minerals in the Kootenays.

Mr. A. G. Langley, District Engineer for Mineral Survey District No. 5 pointed out that his District was responsible for the entire Lead-Zinc production of Canada and was second only to the Cobalt in silver output. The principal methods mined, taken in the order of the value of production, were: lead, zinc, silver, gold and copper.

Referring to the importance of Rossland as a gold camp Mr. Langley said that the Consolidated Mining & Smelting Company had recently curtailed the production of their properties pending the installation of a concentrator to treat the low grade sulphides. When this was completed a considerable increase in output was contemplated.

Discussing the Yankee Girl at Ymir Camp it is pointed out that this property has been a substantial producer of gold in the past, that in 1918 about 8,000 tons of ore were shipped to the Greenwood Smelter, from which very favorable rates were obtained "due to the fact that the ore was suitable for mixing with those of the Boundary District." Shipments, he stated, had been suspended in December of 1918, "but there is reported to be a considerable tonnage of milling ore available, and judging from reports it is a property well worthy of further investigation with a view to installing a concentrator to treat the low grade sulphides. The principal values are in gold and silver."

In the Central Mineral Belt of the Trout lake Mining Division, extending from Camborne to Poplar Creek, numerous prospects have been located.

Near Cambourne the Eva and Oyster Criterion, which are both equipped with ten stamp mills, have had a considerable amount of development work done on them, and there is said to be a large tonnage of low grade ore available. Numerous other properties in this vicinity have been prospected. Among others the Burniere Group at the head of Scott Creek is said to have a good showing."

Discussing the copper production Mr. Langley dealt with the Rossland Camp; the Mountain Chief Mine at Ranata on Arrow Lake, recently come into prominence; the California Mine near Nelson, which had leased the Athabasca Mill and was likely soon to be on a producing basis; and to the Trojan Mine, on Boulder Creek, Windermere District, the management of which were contemplating the erection of a small concentrator. He spoke also of the Eureka Mine, where a considerable body of low grade ore has been encountered in the southern end of the main workings, and stated that the management had leased the Granite Poorman Mill, and installed a Zeigler Flotation Machine. The values of the Eureka, which is situated close to Nelson, are in copper, silver, and gold.

Dealing with Lead-Silver-Zinc, and Lead-Silver-Zinc Gold--Zinc Ores, Mr. Langley said, in regard to the former, that the Kootenays produced more of this

class than any other section. The Slocan Division was first in silver production by a wide margin which the Fort Steel Division was in the van in respect of lead and zinc output.

Reference was made to the Noble Five Mine near Sandon, where the big raise connecting the lower workings with the upper is completed and a 100 Ton Concentrator is being constructed by the General Engineering Company of Salt Lake City. The flow sheet, it was explained, embodies a system of jigs, Whilfley tables, and Callow Flotation Cells. The Surprise Mining Company, the Queen Bess Mine, the Silversmith Mines, and the Rambler-Cariboo Mine were mentioned by Mr. Langley as being either producers or prospective producers in the Sandon District. In connection with the latter properties the 150 Ton Concentrator, being constructed at Alamo, B.C., for Clarence Cunningham, was described. In a recent interview it is stated that Mr. Cunningham expressed his readiness to treat custom ores and it was thought that this would be a help to the small operators of the ditsrict.

In conclusion Mr. Langley said:

"In concentrating the silver-lead-zinc ores from the Slocan and other parts of the District, a fairly high percentage of the silver values is contained in the zinc concentrates, and a solution of the problem of separating the silver from the zinc would be of immense value to the mines of the district.

"Besides the ores already dealt with there are known deposits of molybdenite, chromite, hematite, bismuth, magnetite, and manganese, but none of these is being mined at present."

The Mineralization of Northern Manitoba, by R. C. Wallace, The Pas, Manitoba.

This paper, which was read by proxy, stated that the areas of which something had been learned of late extended northward about 200 miles and was of varying width, averaging about 20 miles. It was some 186 miles distant from The Pas and could be divided into two zones, the Western and the Eastern. The former had been found to be rich in high grade copper and in the latter had been discovered gold. Of the copper properties developed the chief were the Mandy and the Flin Flon, which were copper sulphide ore bodies. They had been discovered in the Fall of 1915 near the boundary of the Provinces of Saskatchewan and Manitoba. The Mandy had been taken over by the Tonapah Mining Company and a subsidiary operating company formed known as the Mandy Mining Company. Ore had been taken from a very high grade lens of Chalcopyrite and hauled 40 miles by wagon, 130 miles by barge to The Pas, and freighted 1,200 miles by railway to Trail Smeltery. Altogether 25,000 tons had been produced, of which half had reached the Smelter, which averaged in its copper content between seventeen and eighteen per cent., with some values in gold and silver. Despite the high transportation expenses a profit had been shown on the ore shipped. On the Flin Flon, during the year 1916-17- and 18, development had proceeded by means of the diamond drill, as a result of which an ore body had been blocked out to a depth of 900 feet. The work done had demonstrated that it was one of the large low-grade copper-sulphide bodies of the Dominion, there being sixteen million tons blocked out to the depth stated averaging eight dollars per ton at present prices. The ore also contained gold and silver values. A smelter would have to be built and a water power developed which was 35 miles distant from the deposit. There was a railway for a distance of 85 miles from The Pas and the Canadian National Ry. will guarantee the provision of transportation facilities providing funds were available to install the 2,000 ton smelter necessary and to undertake to operate it to capacity. In this connection the writer stated that there was a fuel problem because of the high price of coke, but powdered coal might be utilized. He thought that electric smelting might be tried.

Referring to the gold discoveries of the eastern section of the area under discussion the first indications were found on Herb and Wekusko Lakes. Since then prospectors had been active. The Rex Property had been recorded by the Makeever Bros. on which a 40 Ton Lane Mill had been installed in 1918. Between May, 1918, and early inthe following December, when the Mill closed because of labor troubles, approximately $27,000 had been obtained in values from the plates. Work thus far had been confined to the first level and the vein was between 4 and 4½ feet in width.

Closing Resolutions.

The Convention closed with the discussion and passage of a number of resolutions.

Returned Soldiers' Prospecting Parties.

The first was that proposed by the Canadian Mining Institute, embodying a scheme whereby returned soldiers, with the necessary qualifications, may be given an oportunity to prospect for minerals in Canada. The idea is that capable returned men, wanting this kind of work, shall be divided into small parties, each of which shall be in charge of an engineer. These parties, it is explained, would be re-grouped and the latter group placed under the supervision of a divisional engineer. The whole, in turn, would be under a Chief Engineer. Each group would be placed in specified parts of the mineralized zones of Canada, and each man would be paid a small salary, and, of course, maintained. The Dominion Government is to be asked to provide $200,000 to permit 200 returned men to be sent into the field in the manner outlined. It is understood that discoveries by these prospectors would be developed when thought of merit by experts, and their value, when realized, divided in proportions to be decided upon between the discoverers and the Government, the latter having this means of recouping itself in a measure. The proposal was endorsed.

Government Asked to Purchase and Distribute Powder.

A resolution was passed asking the Provincial Government to arrange for the purchase of powder in large quantities for use in each mineral district, and for its distribution through a Government Agency in smal quantities and at minimum charges to prospectors and operators.

Resolutions were also passed asking the Provincial Government to appoint more District Mining Engineers where needed, and petitioning the Dominion Government to intervene for the settlement of the coal miners' strike in the Crows Nest Pass District, inasmuch as the shortage of coke was adversely affecting the metaliferous industry of the Province.

The British Columbia and the Dominion Governments were also urged to provide subsidies to encourage the establishment of a blast furnace of 300 ton daily capacity at some point in the Province on the Pacific Coast.

Special Correspondence

BRITISH COLUMBIA.

Changes in Examination Boards for Miners Certificates.

In accordance with amendments to the Coal Mines Regulation Act enacted at the last session of the Provincial Legislature, the system of examining officials and men employed in and around the coal mines of the Province as to their competency to hold positions of responsibility will be radically changed from the 1st of July next. For some time Mr. Sloan has been engaged in perfecting the organization which is to supplant that of the past, and today he stated that all arrangements were complete and that everything was in shape to launch the new and less cumbersome method of holding examinations and issuing certificates of competency.

Henry Riard, of Coal Creek, B.C., and James Dixon, of Nanaimo, B.C., are the examiners appointed. Both are well and favorably known among all associated with the coal mining industry in the Province. Mr. Miard has been a resident of Canada for over 20 years, and since 1911 has been the miner's representative on the retiring Board of Examiners. For nearly 20 years he has worked in the coal mines of the Crow's Nest Pass Field, and at the time of the outbreak of the war was employed as Overman at No. 3 Mine, Coal Creek Colliery. No sooner did hostilities break out than he was on his way to Europe, reaching the front in the early stages of the great war, and was in the defensive battles at Verdun. Finally he was taken prisoner and held for 27 months in South Westphalia, where he served as interpreter, bookkeeper, timekeeper and in other capacities in a pyrities and barytes mines. He returned to British Columbia about a month ago and is the holder of a First-Class Certificate of Competency in this Province. James Dixon is mine manager at the Reserve Mine operated by the Western Fuel Company, Nanaimo. For several years Mr. Dixon held important official positions in Great Britain. He has been appraiser for the Board of Examiners of B.C., examining the papers of candidates for Certificates of Competency, and both by training and experience is highly qualified for the duties of his new office. He was a teacher in connection with the Technical Mining Classes conducted at Nanaimo and is the holder of a First-Class Certificate of Competency for British Columbia and Great Britain.

Mr. Sloan feels that he is fortunate in being able to obtain two men, so well qualified in every way, to handle the work of examining officials and men wishing to qualify for employment in the coal mines of the Province. He wishes also to make clear a point, in connection with the new system, over which there appears to be some misunderstanding. These two appointments are all that are required for the operation of the change provided for by the amendments to the Coal Mines Regulation Act of last session. Messrs. Miard and Dixon will act in a dual capacity. Firstly they are members, with the Chief Inspector of Mines as chairman, of the Board of Examiners charged with the examination of candidates for Certificates of Competency as coal mine officials. Secondly, they are members, with the Inspectors of Mines of the various districts as chairmen—the personnel of the chairman depending on the particular district in which the examination happens to be in progress—of the Board for the examination of candidates for certificates of competency as coal miners. Thus, Mr. Sloan explains, there is really only one Board, supplemented in the manner indicated by permanent officials of the Inspection Staff of the Department of Mines. This Central Board supersedes the top-heavy machinery which has existed consisting of a Mine officials' Board of six members and nine Miners' Board of three members each, and it permits the reduction of the personnel of the Examining Administration from 33 to 3, enabling the Government to dispense with the services of 27 officials, and at the same time gain increased efficiency.

The formation of this Central Board will remove the difficulties encountered in the satisfactory maintenance of nine Board of Examiners for the examination of coal miners and one Board for the examination of Coal Mine Officials. At present the latter Board consists of three coal mine managers, and three representatives of the men from different parts of the Province, together with the Chief Inspector of Mines. Its headquarters are in Nanaimo, B.C. Two of the men's representatives are of the Crow's Nest Pass Coal Field and, in the course of the past five years only on one occasion has one of these representatives been able to attend a Board meeting. While provision was made to pay the travelling expenses of those coming from a distance, this reimbursement by no means covered the loss of time which trips from various parts of the Province to the Coast entailed. The result was that the Board often found it difficult to obtain a quorum. Its duties, too, have been merely of a supervisory character in connection with examinations. It called a meeting, set a date for examinations, appointed outside parties who had to be paid very highly for their services, to prepare examination papers and examine the answers of candidates. The Board then forwarded the results to the Minister of Mines. Mr. Sloan, when considering reorganization, felt that much of this procedure was useless, besides having the effect of leaving functions of vital importance in the hands of a few, it being impossible in many instances, as has been shown, for the men's representatives to be in attendance at regularly called meetings. Under the new arrangement the two examiners just appointed, with the Chief Inspector of Mines as their chairman, will conduct examinations of candidates for Certificates of Competency as officials in coal mines, wherever it may be most convenient to all concerned.

As stated there now are nine Boards of Examiners for the conduct of examination of candidates wishing Certificates of Competency as coal miners. If the old system were to be continued it would be necessary to augment this number by at least five more and, as the extent of coal mining in the province widened, it would be essential to continue adding to the Boards ad infinitum. This point is illustrated by the present situation. Under the unamended Coal Mines Regulation Act most of the collieries had their own Boards for the examination of men, the membership of which consisted of a secretary appointed by Lieut.-Governor-in-Council, a representative of the mine management, and another of the men. This arrangement, no doubt, was satisfactory so long as there were only a few operating mines in the province. Conditions, however, are changed. There now are a considerable number of small collieries and, if each of these were given a Board, to which they were

entitled under the Act as it stood originally, there might be almost as many members of examining Boards as there are miners coming up for examination monthly.

These problems will be completely met by the new Central Board. Instead of the men going to the Board, the Board will go to them. It will visit each coal mining district at regular intervals, the two permanent examiners just appointed being joined in each district by the Ispector of Mines of that District and conducting examinations for the benefit of miners wishing to secure the Certificates of Competency necessary to permit them to go to work as coal miners. Besides the obvious benefit that this will be to the candidate, both in respect of expense and loss of time, it will have the effect of setting a standard of knowledge among all underground workers in coal throughout the province, making it impossible, as sometimes now happens, for a man to fail before one Board and immediately after successfully passing another Board in an adjacent district. It will obviate the present difficulty of too much Board representation at one point and too little at another. Another important point—and this will be the deathblow to the practice sometimes countenanced in the past of permitting aliens to obtain employment in the coal mines of the province—is that no man will be admitted to a mine to work as a coal miner for a temporary period pending his examination. This has been allowed heretofore. Hereafter, however, if a man applies for work as a miner, and an immediate examination is impracticable, he must go before the Inspector of Mines for the district who, having satisfied himself of the man's qualifications, will issue him a temporary certificate. In such cases those affected must go before the regularly constituted Board at the first opportunity.

In this connection Mr. Sloan maintains that it is a manifest absurdity to allow an uncertificated man to assume the responsibilities of a miner for thirty days without his knowledge being tested, it being possible for an incompetent person in that period to endanger, not only his own life, but that of hundreds of others. He points out, too, as indicated, that the necessity of a candidate going before an Inspector of Mines to secure a temporary certificate will provide the means of much more adequate control than at present over those given underground employment, and he feels it will restrict the employment of aliens underground as miners in British Columbia.

Mr. Donald McLean, manager of the Coalmont (B.C.) Collieries, has been appointed Inspector of Mines for the Merritt District, according to an announcement made to-day (June 28) by Hon. Wm. Sloan, Minister of Mines.

This vacancy was created through the transfer of Inspector Andrew Strachan from Merritt to Fernie on the retirement of former Inspector T. H. Williams from the Crow's Nest Pass District.

The new Inspector of Mines, Mr. McLean, returned from service overseas about 18 months ago. He enlisted in the early part of the war and was through a considerable of the first military operations on the western front. Finally he was wounded and invalided home.

Mr. McLean has high qualifications for the discharge of the duties of the post to which he has been appointed. He is the holder of a First Class Certificate of Competency for British Columbia and Alberta and, since his return from Europe, has been manager of the Coalmont Colliery. He also has had a varied and lengthy experience in other coal mines of the province, for many years being employed as overman at the Extension Colliery, and later teaching at the Mining School at Ladysmith.

NORTHERN ONTARIO.

"Post-Mortem" on Nipissing Not Necessary — Our Correspondent Reveals Inaccuracy of Deductions in Toronto "Saturday Night" Article.

In an article written by Carpel L. Berger, in the Financial World," New York, and reproduced in the "Saturday Night," Toronto, on June 21st, appear a number of startling deductions and prophesies with regard to the Nipissing Mines, of Cobalt. The article is one of the most pessimistic written in recent years in connection with the silver mines of Cobalt, and would be alarming to shareholders of some of the mining companies operating in the district, but for the undeniable fact that the article from beginning to end is founded chiefly on inaccuracies, and is but another demonstration of how impossible it is, and how pitiful is the attempt of any man to deal with a subject about which he has but very little information. The article does not even show ability to properly analyse a mining report.

For instance, it is stated that "Only 33 ounces per ton was the average recovery in the first 4 months of 1919 from combined high-grade washing ores and low-grade cyanide milling ores." How the writer arrived at these figures is difficult to understand, as the official average has ranged from 40 to 45 ounces. It is quite possible the 33 ounce average was reached by dividing the number of ounces produced by the Nipissing by the amount of ore treated in the mill. Mr. Breger apparently divided the Nipissing bullion production by not only Nipissing ore, but also including the customs-ore from other mines which was treated in the Nipissing mill. So much for the incorrect statement in connection with the average grade of the ore.

The writer continues: "In the early months of 1919, the yield of high grade washing ores dropped to only 700 ounces per ton, and when it dropped to 450 ounces per ton in April, the high grade mill was closed down, signifying the exhaustion of large bodies of high-grade ore. Henceforth the high-grade, such as may remain or be found, will probably be mixed with and handled as part of the feed of the low-grade mill." This statement is incorrect in every particular. First, it is a fact that the high grade ore treated so far this year has averaged from 1,400 to 1,600 ounces per ton, and for the first six months of 1919 has exceeded the average of 1918. Second, the high-grade ore *is not* being mixed with and handled as a part of the feed for the low-grade mill. The fact is that owing to the war having caused the quotations for mercury to increase from a minimum $33 per flask of 75 pounds, to a maximum of $130 per flask, it was decided to discontinue the amalgamation process, but arrangements were made to treat the high-grade by cyanidation, after giving the ore a preliminary treatment with bleaching powder in the tube mill. Accordingly, the necessary apparatus for the process was installed under the same roof as the equipment for treating low-grade ore. This is why the New York critic becomes erroneously obsessed with the idea that the Nipissing had exhausted its high grade ore! Furthermore, the change was not made in April, as Mr. Berger states. The change was made in August, 1918,

and is so stated in the last annual report of the Nipissing Mining Company.

It is one of the ironies of fate that when Mr. Berger was writing his article, pointing out that during the first four months of 1919 the Nipissing produced $952,-197, or an average of about $238,049 monthly, the company was setting a new high record by producing $347,-751 in May, one of the highest month's output in the history of any silver producing mine in the British Empire. Also, for the first half of the current year the output has amounted to upwards of $1,600,000, or at the rate of upwards of $3,200,000 annually, as compared with Mr. Berger's guess of about two and a half million ounces, which at the present high quotation for silver would be approximately half a million dollars less than that actually indicated. Indeed with the exception of 1918, the production from the Nipissing during 1919 will probably have a greater value than any previous year in the company's history. This fact is clearly shown in the following summary of production since the mine was first opened, and also showing the dividends paid from year to year, with 1918 and 1919 in point of dividends paid, equal to the company's best years, with the exception of 1910:

Year	Dividends Paid.	Value Produced.
1904	.....	$ 23,887.52
1905	.....	471,666.61
1906	$480,000	1,421,655.54
1907	840,000	1,234,492.35
1908	720,000	1,364,478.03
1909	1,350,000	2,180,407.02
1910	2,100,000	2,742,842.58
1911	1,800,000	2,381,712.54
1912	1,800,000	2,827,317.62
1913	1,800,000	2,920,714.26
1914	1,350,000	2,207,427.72
1915	1,200,000	2,383,877.91
1916	1,500,000	2,687,530.85
1917	1,800,000	3,239,151.62
1918	1,800,000	4,166,064.27
1919	1,800,000	3,250,000.00
Totals	$20,940,000	$35,503,226.44

A study of the above figures reveals the interesting fact that approximately 59 per cent of the entire production has been paid in dividends.

It might be interesting to state that during the first five months of 1919 the Nipissing produced $1,299,-948, on which a "net" profit of $800,000 was realized This reveals the very significant fact that current profits amount to approximately 61 per cent of the total output, as compared with an average of 59 per cent since the mine was first opened up. These figures are not prophecy, or expectations, but are facts. Figures, fortunately, do not lie, no matter to what severe tests they may be put. To the 59 per cent, of course, must be added the present treasury surplus; yet, after adding this, it is still evident that the Nipissing is maintaining its earning power on a par with its best days.

Pessimists sometimes point toward the Nipissing's ore reserves of 6,000,000 ounces as of the beginning of the current year. They did the same many years ago. As fr back as 1915 the general manager, R. B. Watson, apparently had this in mind when he opened the concluding paragraph of his annual statement with the remark, "The Nipissing Mine has never shown ore reserves commensurate with its annual output, but the history of the company during the past twelve years has shown that the development of new ores has kept pace with the current production."

To the foregoing, the year 1919 promises to be no exception, in that already a large amount of new high-grade ore has been developed this year. As to what the future will bring, it would be folly to hazard a guess. However, that the Nipissing, with quotations for silver at or above $1 per ounce, will enjoy prosperity for a good many years seems certain. The Nipissing, like every other mine discovered, must some day end its profitable career. Every dollar taken out leaves that much less in any mine. This fact is obvious to all. Nevertheless only unrelieved pessimism can explain the spectacle of a careless critic holding a postmortem over a world-famous mine just at the moment when that particular mine is enjoying the acme of prosperity.

Increased Price of Silver Brings Bonus to Cobalt Miners.

During the month of June, the quotations for commercial bar silver, as submitted by Handy and Harman, of New York, showed an average of a fraction of a cent above the $1.10 mark, and it is understood the majority of the mines of Cobalt have decided to pay their employees an additional bonus of 25 cents per day. This increases the bonus to $1.50 daily above the regular rage.

The bonus, or profit-sharing plan, was adopted in 1917, and is based upon the quotations for silver, a bonus of 25 cents a day to be paid when silver averages 60 cents or over for the month, and an additional 25 cents a day for each ten points above 60 cents. Although there has apparently been no promise made to the men that this system would continue beyond that of $1.25 per day paid on $1 silver, yet the high cost of living has been taken into account by the mining companies, with the result as above stated that a bonus of $1.50 a day will be paid by the majority of the mines on silver at $1.10 cents an ounce or over.

The additional bonus during June will add about $600 every 24 hours to the men engaged in mining at Cobalt. There are upwards of 2,300 men engaged, and allowing a 26-day working month, the monthly pay-roll will be increased approximately $15,600, or at the rate of about $187,200 annualy, provided it should continue that long.

Kirkland Lake District.

Following the successful development of the Ontario-Kirkland Mine, formerly the Hurd property, arrangements have been made to instal a mill at an early date. The plant will have a capacity for treating 100 tons daily, and will be installed with the least possible delay, the contract having already been let, according to official advice just to hand.

During the present lull in operations, caused by the labor strike, the macadam road from Swastika to Kirkland Lake is being built, under the direction of the Ontario Government. With this road completed this year, the transportation of heavy machinery will be made less difficult.

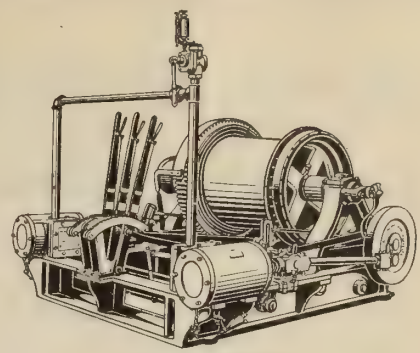
At the 300-ft. level of the Ontario-Kirkland, two veins have been opened up in one of which $28 ore is showing in the west drift across a width of about five feet. This was at first thought to be vein No. 1, but in working out the fault problem was found to be No. 2 vein. Accordingly, a cross-cut is being driven north to tap the No. 1 vein. About 30 feet remains between the present face of the cross-cut and the point where No. 1 vein is expected to be encountered.

MINE HOISTS

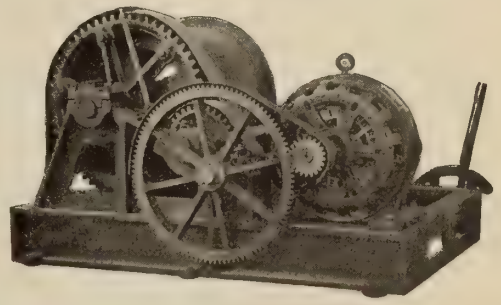
We are specialists in the building of Hoisting Machinery of all sorts. For nearly a quarter of a century we have been designing and building Hoists, and have developed a Hoist that we are really proud of—proud because of the record of good work they have done, and are doing in mines, quarries, and other classes of work from one end of Canada to the other.

We have just received from the printer the new edition of our Mining Catalogue, showing our Hoists, Cars, Cages, Buckets, Ships, Derricks, etc., and will send you a copy if you will drop us a card.

ANY SIZE YOU WANT IN MINE HOISTS, EITHER STEAM OR ELECTRIC POWER FROM 10 TO 50 HORSE-POWER.



STEAM POWER



ELECTRIC POWER

Marsh Engineering Works Limited, Belleville, Ontario

ESTABLISHED 1846

Sales Agents; MUSSENS LIMITED, Montreal, Toronto, Winnipeg and Vancouver

Plans are under way to carry out an aggressive exploration programme on the property of the Greene-Kirkland Company, at Kirkland Lake, toward which end a small mining plant is to be installed.

The property consists of a group of claims formerly owned by the Lucky Cross Mining Company. Part of the Lucky Cross property was sold last winter to the Marigold Mining Company, the remainder going to the Greene-Kirkland. The latter company is practically a closed corporation, and is being financed largely by interests in Chicago.

Boston Creek Not Involved in Strike.

At Boston Creek a peculiar situation has arisen in connection with the labor strike. It is now understood that although the men at the Miller-Independence went out on strike at the same time that the Kirkland Lake strike was called, they had not been told to do so by the officials of the organization to which some of them belong.

About a week or ten days ago a labor delegation of three from Kirkland Lake called at the Miller-Independence, and stated that no strike had been called. As a consequence, therefore, there would appear to be nothing in the way to prevent the resumption of work under the old conditions at any time the Miller-Independence so desires.

As this was the only property in the camp where the men quit work, the Boston Creek camp may now be said to not be involved in any way in the labor strike.

Another shoot of high grade ore is stated to have been opened up at a depth of about 575 feet on the Temiskaming Mine. Until further work is done it will not be possible to estimate whether or not the find is important.

WILL DEVELOP HERB LAKE PROPERTIES.

The Pas, Man.—Having been relieved of the financial burden of carrying on its Mexican properties, Messrs. Makeever Brothers, of New York, owners of the Rex at Herb lake, feel they are now in a position to open up the property. They are planning, it is stated, to go ahead upon a large scale sometime in August.—The Pas Herald.

Of this property Dr. R. C. Wallace, Mining Commisisoner of Northern Manitoba reported in March as follows: One property—the Rex—has reached the producing stage. The Makeever Brothers have erected a 40-ton Lane mill, with amalgamation plates and two Deister Overstrom tables, a 55-h.p. engine, two 60 h.p. boilers and 390 cu. ft. air compressor. The mill was in operation from May 1st to December 1st, 1918, when adverse labor conditions, accentuated by the influenza epidemic, necessitated its closing for the winter. Approximately $27,000 of gold were obtained from the plates during the time of operation, representing the first regular output of gold from any mine in Manitoba. The amount of underground work is relatively small, and is confined to stoping from the drift on the 100-ft. level, and it was possible to employ a single shaft only to operate the mill. The vein is exposed for 1,700 feet, and has an average width in the shaft and drift of probably 4½ feet. The values throughout this width range from $110 to $6, with an average of over $20. Sulphides are unimportant except on the walls. The concentrates from the table are stored for extraction when a cyanide plant shall have been added to the mill equipment. It is planned, upon the resumption of operations in the fall, to pursue much more extensive underground developments, in order that the mill may be operated on a continuous basis.

IN THE MATTER OF

The German Development Company, Limited

SEALED TENDERS will be received addressed to **G. T. Clarkson, 15 Wellington Street West, Toronto,** and marked "Tenders re German Development Company, Limited," up to Twelve o'clock noon of **Wednesday, July 16th, 1919,** for the purchase of the following assets of the German Development Company, Limited, namely:

Parcel No. 1.—68,000 shares, of a par value of $1.00 each, of the Capital Stock of the Miller Lake and Everett Mines, Limited, the owner of certain mining claims in the Miller Lake District in Northern Ontario.

Parcel No. 2.—Mining Claim being the S.E. ¼ of the N. ½ of Lot 9 in the 5th Concession in the Township of James, Timagami Forest Reserve, containing 39-⅝ acres, more or less, covered by Mining Lease No. 3818, from the Province of Ontario.

Parcel No. 3.—Mining Claims T. C. 453, 454, 455, 456, and 457, and M.E. 723, 522 and 523, and G.G. in the Township of Halton, District of Nipissing, containing 157 2-5 acres, more or less, covered by Mining Lease No. 3875, from the Province of Ontario.

Parcel No. 4.—Mining Claim being the N.E. ¼ of the N. ½ of Lot 12, in the 4th Concession in the Township of James, District of Nipissing, containing 4¾ acres, more or less, covered by Mining Lease No. 3878, from the Province of Ontario.

Tenders for Parcel No. 1 must be at a rate per share for the shares offered, and the tenderers must agree to purchase any lesser number of shares than 68,000, but not less than 25,000, if the undersigned shall so require.

As to Parcels Nos. 2, 3 and 4, the purchasers shall search the title at their own expense, and purchasers shall have ten days in which to make any objection or requisition as to title. In case any purchaser shall within such time make any objection or requisition which the undersigned shall be unable or unwilling to remove or answer the undersigned shall be at liberty to rescind the sale, in which case the purchaser shall be entitled only to a return of the deposit money without interest, costs or compensation.

Terms of Sale:—25 per cent cash and the balance within thirty days.

Each purchaser at the time of sale must sign an agreement for the completion of the purchase.

Tenders will be opened at the office of the undersigned, 15 Wellington Street, West, Toronto, at Twelve o'clock noon of Thursday, July 17th, 1919, when all tenderers are requested to be present.

Tenders must be accompanied by a marked cheque payable to the undersigned for 10% of the amount of the tender, which will be returned if the tender be not accepted. The highest or any tender not necessarily accepted.

For further particulars and conditions of sale application may be made to the undersigned.

Dated at Toronto this 9th day of June, 1919.

G. T. CLARKSON,
Controller and Manager of
The German Development
Company Limited

COAL-LANDS IN SMOKY RIVER DISTRICT, ALBERTA.

Report of Special Committee of Senate discloses Irregularities in Leasing of Mining Rights, Which Are Cancelled.

The Special Committee appointed by the Senate to investigate charges of irregularity in the granting of leases in the Smoky River District has reported. The coal mining locations comprised 18,000 acres of land and were originally held by a German-American syndicate, including one Dr. Reinbold Hoppe, of Oakland, Calif. That syndicate had expended $200,000 in work on the property and had paid $115,000 in rentals at a dollar an acre a year, when the leases were cancelled by the Interior Department because of default in payment of rentals. The leases were cancelled on August 3rd, 1918, and by August 21st all the locations had been re-staked by eight prospectors, who secured leases and in January, 1919, assigned their rights to Messrs. Shillington and Barnard.

The investigation by the special committee was ordered as a result of suggestions made in the Senate by Senators Bostock and Bradbury. The committee in its finding expresses the opinion that S. J. Robbins, formerly assistant secretary to the Minister of the Interior, disclosed information in the possession of the Interior Department with respect to the cancellation of the Hoppe leases. The committee finds that Mr. Robbins and George Craig, a clerk in the department, who is related to Dr. Shillington, went to Edmonton immediately after the Hoppe leases were cancelled. From this the committee infers that Messrs. Robbins and Craig aided those who re-staked the locations and subsequently assigned their rights. The committee recommends that the Interior Department hereafter deal with coal locations as it does with timber limits, investigate them, fix up-set prices for leases. disclose the information to the public and call for tenders for the locations. The committee also suggests that legislation be enacted to make disclosure of confidential information by a department official a criminal offence.

Since the granting of the mining rights on the Smoky River locations was brought to the attention of the Senate and the Government, the leases of Messrs. Shillington and Barnard have been cancelled.

PREDICTS GREATEST COAL SHORTAGE.

Chicago, June 29.—Government coal production figures point to "the greatest coal shortage in history" next winter unless production is stimulated immediately 25 per cent. or more throughout the nation, according to a statement made public to-day by F. S. Peabody, Chairman of the National Coal Association's special committee dealing with the prospective shortage.

"The information gathered by the committee is that at the present rate of production one industrial plant out of every eight in the United States will have to shut down next winter for lack of coal," said the statement, which attributed the falling off in production to the extremely low demand.

The bituminous coal shortage of 65,000,000 tons for the first 24 weeks of 1919 must be wiped out and production increased 30 per cent. the remainder of the year to meet the nation's requirements of 530,000,000 tons, according to the statement.

EDITORIAL

CANADA'S COAL INSUFFICIENCY.

Mr. White, the Consulting Engineer of the Commission of Conservation, is directing the attention of the public to the menace to the general stability of Canada arising from the absence of a developed supply of coal within the confines of Canada.

Dealing with the dependence of Canada on the United States for coal, Mr. White remarks "a nation pressed by the demands of its own people may be compelled under certain conditions to deprive other nations, in part, at least, of even the necessaries of life until the needs of its own citizens are met."

So far as coal is concerned, the United States can supply Canada with all the coal we require, and more, because the United States is the most richly coal-endowed nation in the world, and it has also brought the development of its coal seams to a point unprecedently and phenomenally large. There is no adjective to describe the United States coal industry more fitting than the favorite expression of our late enemies —"colossal." Superlatives are necessary when dealing with an industry that produces almost 900,000,000 tons of coal annually.

The danger, to our mind, that arises from the neglected and undeveloped state of Canadian coal mining, is not a danger of being deprived of our coal supply, except it be through congestion of traffic and insufficient transportation facilities aggravated by bad weather, but lies in the fact that undeveloped natural resources are the equivalent of non-possession of such resources.

Our readers will know that this Journal has urged for over a decade serious consideration of the dangers that lie in our utter dependence on the United States for a coal supply. We have submitted the proposition that economic dependence sooner or later must bring political subservience, and we can see no escape from the implications of this proposition.

A consideration of the coal statistics of Canada will show two outstanding features, first that Canadian coal production is either stationary or declining. We submit that if the coal production of Canada is stationary, it is on the down grade, because in this growing country, if an industry of such basic importance as coal production is not advancing it is losing ground. The second feature is that the per capita consumption of coal in Canada is increasing, and the total tonnage of coal consumed in Canada is going up very rapidly, but that the importation of United States coal is going up more rapidly than either.

The total production of coal in Canada was saved from showing a disgraceful slump in the past two years by the increased production from the Alberta collieries, and it was then demonstrated that Canada can get along by consuming the product of its own coal-seams rather better than some faint-hearted people had dared to anticipate. We can always manage without that which we cannot obtain, and it is interesting to know how much greater a value attaches to a supposedly inferior product when no better is available. In times of stringency Canada is not forced to substitute "ersatz" products, or mere imitations of the real thing. Canada has coal-seams in abundance, containing a plentitude of excellent fuel, and while it is true that our greatest coal deposits are situated inconveniently far from our great centres of population, as they exist to-day, it is equally true that even those coal deposits which are close at hand are neglected and to a great extent despised. People in Winnipeg thought they were suffering hardships when asked to burn "soft" coal last winter, but they found it quite feasible, and it may be remarked that there is no "hard" coal in Europe.

If Canada's coal output were marching even on a "fifty-fifty" basis with her consumption, as it did for many years, the outlook would be more tolerable, but in the matter of coal-mining, as the United States figures go up, ours go down, and that is the discouraging feature.

Another discouragement is that we are paying for coal by a depreciated currency, at higher prices than coal has previous sold for, and we are buying more of it, to which we may add that every ton of coal mined in the United States that might have been mined in Canada, increases our financial embarrassment and disadvantage. This feature, however, is we trust a passing one, and while it is sufficiently serious, it is not so serious as the decay of our domestic coal-mining industry.

THE "CANADIAN FERTILIZER."

The latest addition to Canadian technical periodicals is the "Canadian Fertilizer," published by the Biggar Press of Toronto, and we think the appearance of such a paper has its significance and should interest mining men, who are quite closely concerned with the production of artificial fertilizers. Lime, sulphur, and phosphates in various combinations are all products of the mine, and the market for their sale is wide and capable of great extension.

The use of sulphate-of-ammonia and basic-slag fertilizer, two of the ordinary by-products of steel plants,

are only in the early stage in Canada. The home market for sulphate has hitherto been neglected by Canadian manufacturers because it could be more easily sold for export. There are great possibilities in the popularization of sulphate-of-ammonia for use by the amateur and allotment gardener, if a neutral salt, prepared in a dry and easily distributed form, were to be placed on the market in attractive packages. Sulphate-of-ammonia is usually a chief component of the "plant-foods" sold as proprietary preparations by wholesale houses, under fancy names. The sale of ground basic-slag has never in Canada reached the demand, and the value of this fertilizer is widely admitted by agriculturists.

It is interesting to know that there is a probability of the plant of the British Chemical Company at Trenton, Ontario, being used as a fertilizer manufactory. Canadian apatite being employed. The Canadian apatite mining industry was killed by the competition of the enormous and easily mined deposits of the Southern States, but the increase in freight rates has lessened the comparative disadvantage of the Quebec deposits. The combination of the fine sulphuric acid plant at Trenton, with locally produced pyrites and apatite should render possible a notable increase in home production of fertilizers.

If the "Canadian Fertilizer" provides a medium that will enable Canadian producers of fertilizing materials to get into touch with the Canadian agriculturists, and thereby cultivate and supply a demand that is only in its beginning, it will serve a very useful purpose. This country is under no necessity to import fertilizers.

CORRESPONDENCE.

Exploration in the Porcupine Gold Area.

To the Editor of the Canadian Mining Journal:

Sir,—During a recent hurried trip to the Porcupine district I was impressed by certain features regarding the development of the area as a whole. My object in wishing to record those impressions is not to criticise the operators in the district nor to air my own views, but to invite the discussion of other engineers who are better informed on the geology and development of the district.

The large number of mining or prospecting plants scattered over a large area is striking. The view obtained from the train window from the time it leaves Porcupine until it reaches Timmins gives an observer the impression of being in the midst of a great mining region, comparable to the copper or iron ranges of Michigan, or the gold-bearing banket of the Rand. The galvanized-iron-covered shaft and power houses, which are universally used in the district, with the attendent dumps from exploratory openings, are to be seen on every hand.

The fact that many of these plants are closed at the present time is owing in part to the conditions brought about by the war, but probably the greater part of them would be closed if labor conditions had remained normal. This is inferred from the fact that of the large number of operations only a few have become producers. Evidently, the remaining plants stand as monuments to the willingness of people to the long shots in the mining business. The advisability of occasionally taking a long shot in mining is not under discussion; the custom is too obviously essential to need argument. Rather, it is the object to scrutinize the practise from the standpoint of making the long shot as short as possible, and secondly to prove the likelihood of its hitting something as economically as possible.

The large number of properties at which extensive prospecting work has been carried on and the few mines resulting inclines one to the opinion that not sufficient discretion has been used in selecting ground for development. To erect expensive plants, sink shafts and drive shafts on a piece of ground which has as its only recommendation a certain nearness geographically to the Hollinger is too great a speculation. If nearness to a great mine is backed up by geological evidence the case for a property is strengthened, and if in addition a vein of good ore is exposed at the surface the expenditure of a limited amount of money is usually advisable. But to spend large sums without some such basis is rash indeed.

This brings us to the other point, namely, the expense necessary to be incurred in definitely proving that a piece of ground has or has not the makings of a mine. The impression that money has been spent too lavishly on exploratory plants is easily acquired at Porcupine. The buildings, headframes and other surface equipment are usually so elaborate as to suggest that they were erected to serve real mines rather than exploratory operations which had only possibilities of developing into real mines. Also the dumps accompanying these plants are large, and the question is pertinent whether diamond drilling, which requires such a small initial outlay for plant, could not in many cases have answered the requirements of the sinking and drifting operations.

Finally, it is my opinon that if a large proportion of the money spent in prospecting in this district had been used in well directed reconnaissance work in Ontario's vast expanse of unexplored territory the results probably would have been better . A group of mining men who are ready to take a reasonable mining chance would fare better by spending money looking for new districts or new mines with favorable geological conditions rather than gambling on unlikely looking groun which happens to be near a great mine. Also, when a decision is made to give a showing a try-out the prospecting and development expense should be kept at the lowest possible figure, at least until the work gives distinctly encouraging results.

I wish to repeat that these observations are not made in a spirit of criticism. They are based on a very brief stay in the district, and more careful investigation might have caused me to alter these views.

L. H. GOODWIN,
Mining Engineer,
New York.

At a meeting of the Manchester Geological and Mining Society on Tuesday, it was intimated that Lieut. Brown, one of the aviators in the Atlantic flight, was a member of the organization, and on the motion of the President (Mr. Orchard) it was decided to send a letter congratulating Lieut. Brown on his fine and historic performance.

Matachewan Gold Area

The Otis-e and Davidson Gold Deposits

A description by H. C. COOKE, with introductory comments by R. E. HORE.

In the June number of "Economic Geology," H. C. Cooke, of the Geological Survey, Ottawa, has an article on "The origin of the gold deposits of Matachewan district, Ontario." The deposits referred to are those known as the Otisse and Davidson, some information concerning which was published in a preliminary report by A. G. Burrows, of the Ontario Bureau of Mines some time ago.

Since the report by Mr. Burrows, a considerable amount of work has been done on the Otisse proper-

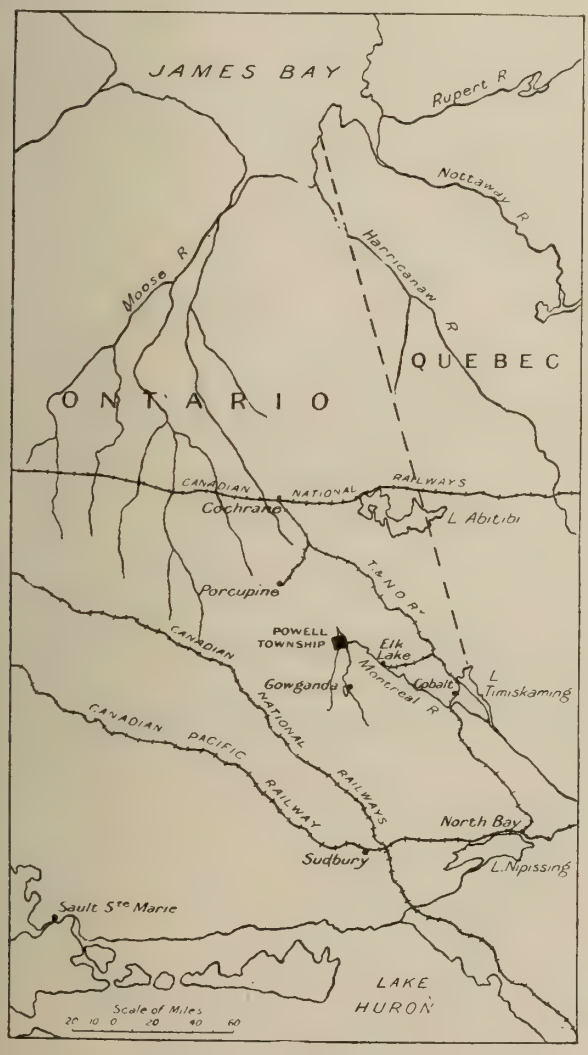


Fig. 1.—Sketch map showing location of Powell Township.

ty, now being operated by Matachewan Gold Mines, Ltd. Last summer, when the writer spent a few hours at the Otisse property, men were at work completing camp buildings and removing surface debris preparatory to sinking a shaft. A number of trenches had exposed the rocks and veins in many places. A diamond drill was in operation. Dr. Cooke examined the property carefully just before I visited it, and the operators have been looking forward to seeing the geological report. They should find in it much that would help them in obtaining information as to the nature of the deposits and the rocks that enclose them. During the past winter the property was idle. Work was resumed this spring, however, and important developments may be expected this summer.

Much remains to be learned about the deposit, but sufficient is known to encourage the operators to test the property carefully. When I visited the property, I found it to be a very promising one; but one that could only be properly described if I were given all the available information, so that I might intelligently put together my own observations, and the results of the operator's testing and sampling.

My purpose in writing this article is to make available to our readers some information concerning it which has been obtained at the public expense, but which, by permission of the Geological Survey, has been published in the United States instead of in Canada. Dr. Cooke has written an excellent paper. It is unfortunate that the policy of the Department of Mines should detract so much from the work of a competent and industrious geologist.

With regard to the nature of the ore and wall rocks I might be permitted to suggest that development will show that gold occurs in the Otisse deposits in the form of the native metal at depth as well as at the surface, for there is native gold in the deposits near the surface that was not near the surface when it was formed. I would also predict that in the altered wall rocks it will be found that much of what Dr. Cooke calls calcite is in reality an iron-magnesium-lime carbonate, such as occurs in many other Ontario gold deposits. Rocks largely composed of such carbonates I have called ferrodolomites. They are formed from rocks of many kinds by the carbonating action of solutions such as deposit gold. This characteristic of Ontario gold deposits is so common that I venture the suggestion with regard to the Otisse deposits without analysing the rocks, being quite satisfied in my field examinations at the Otisse that such is the case.

Gold deposits of this type in Northern Ontario are much the same at depth as near the surface. The gold is in the form of native gold. Much of the so-called "auriferous pyrite" is merely a mechanical mixture of native gold and pyrite. There is no known reason why such ore as occurs near the surface at the Otisse property should not be found at any minable depth. I believe that it will be. There is, of course, a little surface alteration and residual deposits that are locally quite rich in gold; but the freshly broken ore quite close to the surface is of a character that might be expected at any depth that is likely to be reached in mining operations. It is reasonable to expect that an important mine will be developed by Matachewan Gold Mines, Ltd., on the Otisse property.

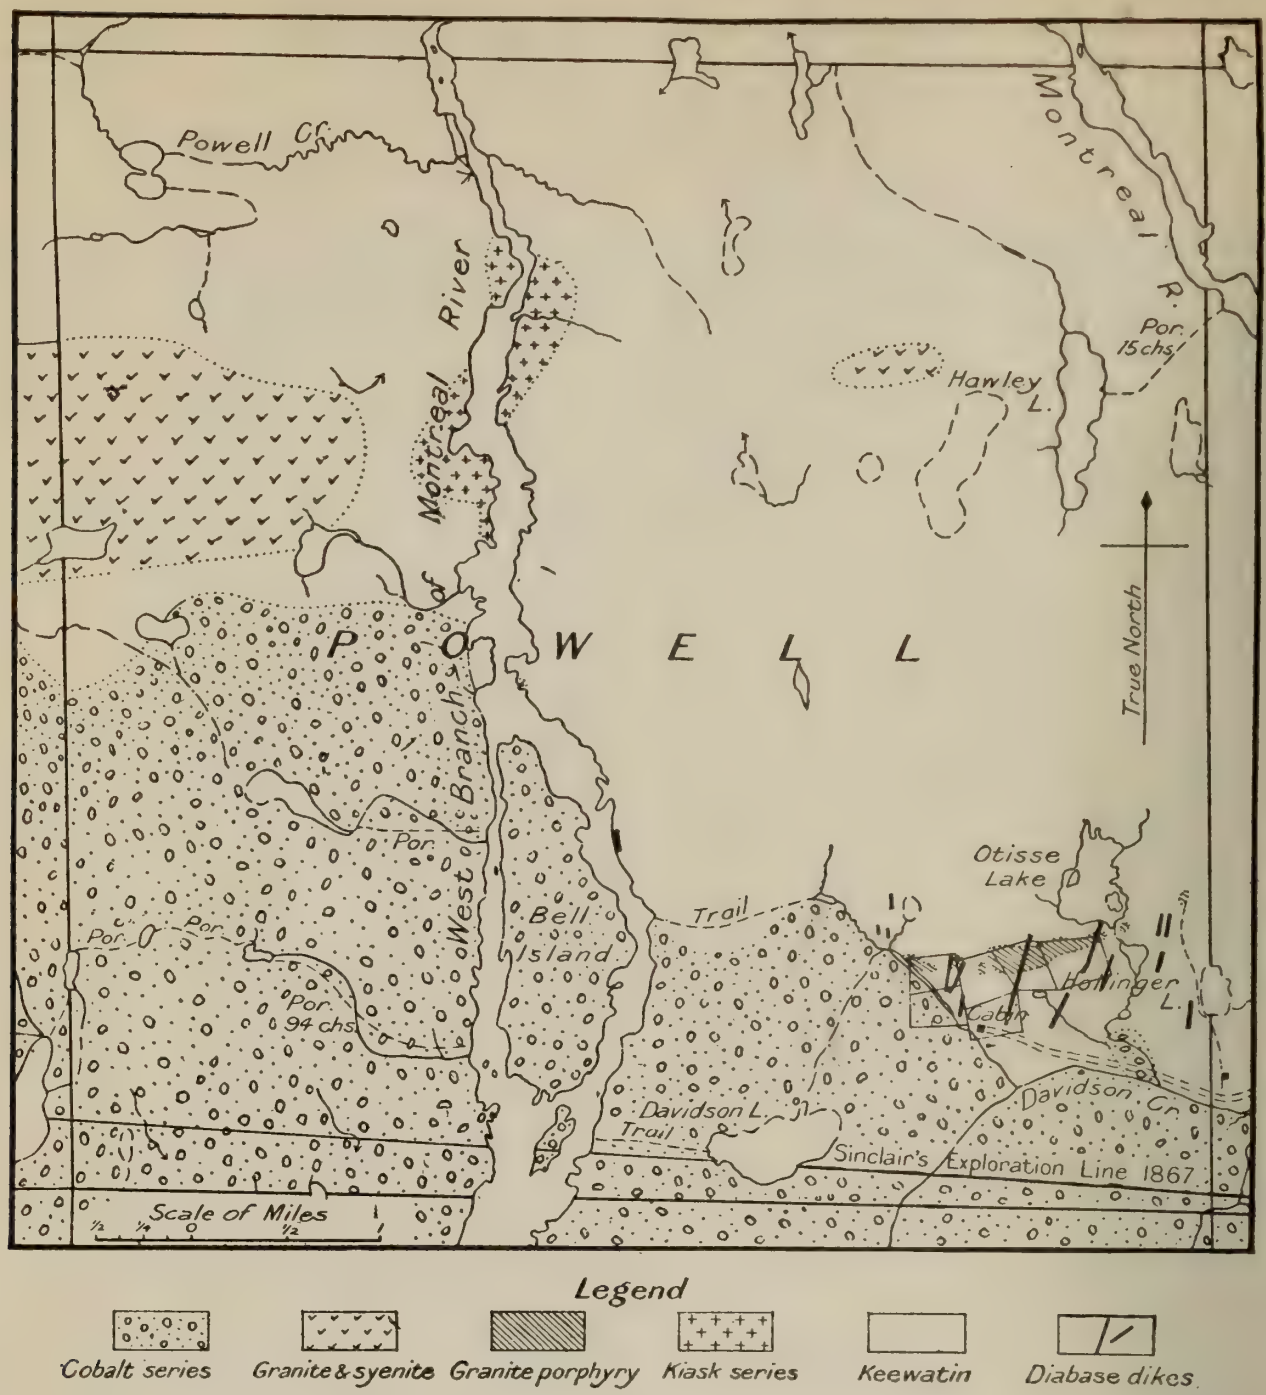

Fig. 2.—Powell Township, Northern Ontario. The claims near Davidson creek are those on which important discoveries have been made.

Dr. Cooke has, in his paper, directed attention to a type of deposit that gold prospectors will do well to examine carefully — small pegmatite masses enclosed by carbonated grey rocks that are sprinkled with pyrite. Early development work at the Otisse showed good gold values in such pegmatites and in the pyritic ferrodolomite. The latter is a dull finely-grained grey-colored rock, composed largely of carbonates that weather rusty, and other constituents which vary according to the original character of the rock and the degree of alteration. The rocks which are so characteristic of Ontario gold deposits. The carbonating is evidently done by solutions escaping from fissures and is common along auriferous quartz veins. In the case of the Otisse it is pegmatite composed of feldspar and quartz instead of ordinary quartz.

The Davidson Deposits.

Of the Davidson deposits Dr. Cooke says:

The ore bodies of this property are found in the schists surrounding the intrusive. Little is known as yet about the nature of the ore bodies beyond what can be seen on the surface, as drilling had not been carried far enough at the time of examination to show with certainty the connection of the subsurface ore bodies with the surface ores. Many of the statements here made will probably therefore have to be revised at a later date.

"The schist ore bodies are lenticular. While this has been proved in only two cases by the removal of

the drift from the whole outcrop of the ore body (namely those at the south ends of trenches 8 and 9, Fig. 5), the fact that ore bodies crossed by a trench can rarely be picked up in a parallel trench 50 or 100 feet distant, indicates a similar shape for these also. Drilling is at present being conducted with the object of testing the hypothesis that the lenticular outcrops are but the surface expression of ore shoots which may have a considerable downward extension. The size of the ore bodies varies greatly; small bodies a few inches or feet in width are numerous, while the largest so far found is about 75 feet in width. The large bodies lie with their long axes approximately parallel to the bedding planes of the tuffs, and may eventually prove to have some relation to the secondary folding. The position of the smallest bodies, those in general less than a foot in width, does not seem to have been controlled by the bedding, but by joint cracks, so that they lie in various positions.

The internal structure of the ore bodies of the Otisse type is indicative of their origin. Fig. 5 shows on a large scale one such ore body about 12 ft. in width. At the centre there is a body of rather siliceous pegmatite about 3 ft. in width measured along the trench; on each side a band of altered and mineralized rock, about 3 feet wide on the south side and 1½ feet wide on the north side. The alteration, which will be described more fully later, consists mainly of calcitization. The mineralization consists of pyrite, usually auriferous. An outer zone of rock, altered but not mineralized, flanks the altered and mineralized zone; this is 6 feet wide on the north side, and slightly less than a foot on the south. The light grey, altered rock grades into the dark green country rock in a short distance, but without any sharp boundary line. The gradational zone is commonly an inch or two in width. The line of contact is wavy, and frequently embayed in a highly irregular manner.

"The structure described is characteristic of all the ore bodies in the schist, although it is sometimes rendered more complex by the intrusion of two or more veins of pegmatite within each other's zone of influence, or its recognition may be observed an insufficient development which exposed only ore without the central pegmatite. Variations occur in the composition of the central dike or vein, the width of both inner and outer zones of alteration, and the extent of the enrichment of the inner zone and the alteration in both. The data so far secured are not sufficient to determine the relation between these variations, but enough has been done to indicate that the composition and size of the central dike or vein are the principal governing factors, while there is also a possibility that some of the country rocks may have been more easily altered than others.

"The data bearing on possible differences in susceptibility to alteration in the country rocks are scanty. All of the volcanics are seen under the microscope to be similar in composition, their differences being mainly in the relative proportions of the constituent minerals. If one rock is more susceptible to alteration than another, it cannot be due to difference in composition, and the cause must be sought in physical differences, such as texture. The tuffaceous types, the rhyolite and basalt tuffs, undoubtedly had originally a more open texture than the massive basalts; and when sheared, their lesser competency resulted in their becoming more schistose than the massive rocks. Both their original texture and their greater subsequent schistosity would make them more permeable to solutions, and allow of a larger degree of alteration. As Fig. 5 shows, most of the ore bodies are localized in the rhyolite tuffs and the basalt tuffs which directly underlie them. However, the fortuitous location of these tuffs next to the intrusive makes it impossible to conclude definitely that the localization of the ore bodies is due to the influence of the country rock and not to chance, until the development operations are carried further around the boundaries of the intrusive so as to allow comparisons to be made.

"Data connecting the size and composition of the veins and dikes with the width of the altered zones and the intensity of the mineralization and alteration are more plentiful, but not complete. Dikes of red porphyry, whose composiiton is closely that of the main body of intrusives, have had little effect on the country rock. These may be seen (Fig. 5) in trenches 5, 7, 14. Occasionally they have caused a small amount of pyritization in the wall rock, but never any visible alteration. An exception is the dike cutting trench No. 15. Flanking this dike is a wide zone heavily mineralized with coarse-grained pyrites, but the country rock is slightly, if at all, altered, while the pyrite, unlike that in other ore bodies, has a very small gold content.

"Two dikes of what the miners term "gray porphyry" are exposed by trenches 10-13 (Fig. 5). The outcrops of these dikes, which are lens-shaped, are about 100 feet long, and 10 to 20 feet wide. In their composition they are intermediate betwen a pegmatite and the red porphyry. The amount of feldspar present is so high that they would unhesitatingly be classes as igneous rocks in the field or from the hand specimen, but under the microscope they are seen to be considerably more siliceous than the red porphyry. Alteration of the feldspar to calcite has taken place. The dikes contain sufficient auriferous pyrite to yield gold values varying from $3 to $50 per ton, with an average of about $10. The rhyolite tuff around and betwen the dikes has been only slightly altered, but has been somewaht pyritized over a distance varying from 10 to 25 feet from the dikes. The tenor, however, is low, on the whole $2 per ton or less, although occasionally a high assay has been obtained, due no doubt to the accidental inclusion of a locally enriched portion in the specimen taken.

"The orebody indicated in Fig 5 at the south end of trenches 7 and 8, has as its centre a vein of pegmatite about 4 feet in width. This pegmatite is now much weathered, but can still be seen to have been highly feldspathic, probably about 40 to 50 per cent. feldspar, the remainder mainly quartz. The vein lies parallel to the bedding, and the mineralized and altered zone is approximately 12 to 15 feet in width on the southeast side, and 7 or 8 feet on the northwest side. Beyond the mineralized zone the rock is altered with but slight mineralization for 3 or 4 feet further. The gold content in this lens of ore is among the best on the property, averaging from $12 to $15 per ton. The alteration in the mineralized and altered portions has been intense, fully 75 per cent. of the rock having been replaced by calcite in the portions nearer the central vein of pegmatite.

"Fig. 6 also illustrates the general extent of the alteration and mineralization induced by a pegmatite containing about 8 per cent. of feldspar. It will be

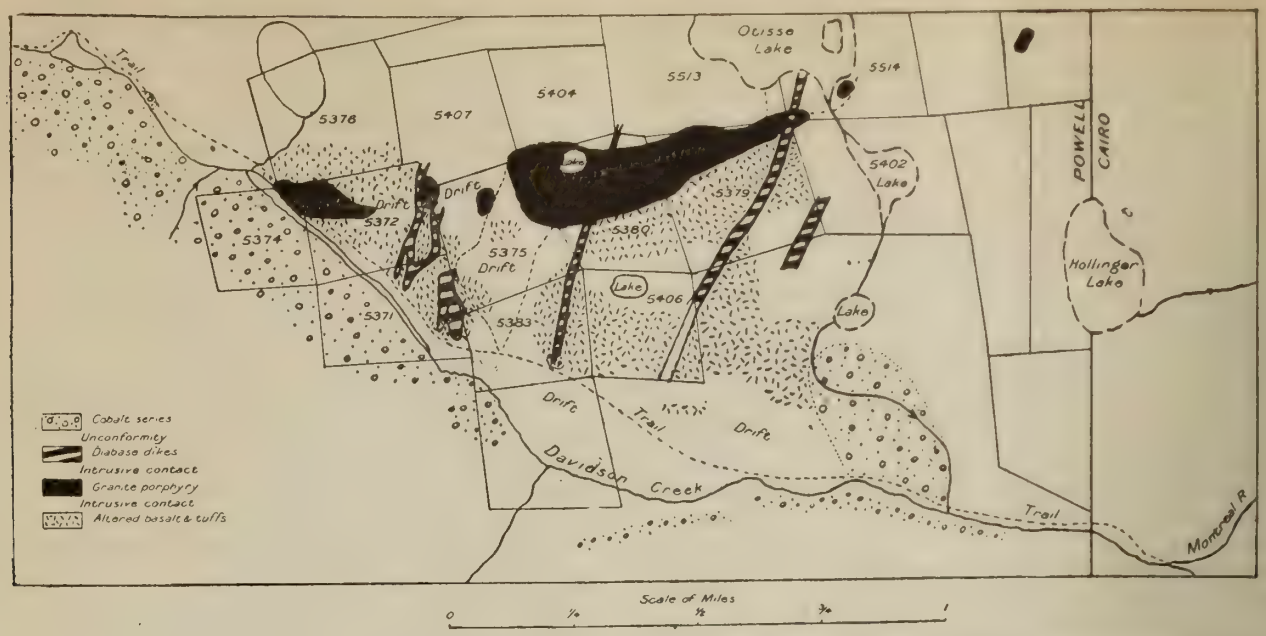

Fig. 3.—Geology of the gold area, Davidson claims 5371, 5372, 5374, 5375, 5383. Matachewan Gold (Colorado-Ontario) claims 5379, 5308, 5402.

observed that although the central vein averages nearly as wide as in the example just described, the total width of the mineralized zones on both sides of the vein is only 4½ feet, as opposed to 18-20 feet. The total width of altered rock with and without mineralization is only about 12 feet, as opposed to 25 feet or more. The gold content in the two cases appear to be about the same, while the intensity of alteration to calcite is slightly less.

"In trenches Nos. 3 and 4, among others, narrow veinlets both of pegmatite and quartz may be seen. The quartz veinlets are never more than about an inch thick. In trench 3 a pegmatite veinlet one quarter to one half inch in width is surrounded by a mineralized and altered zone about 2 feet in width. The pegmatite is about 30 per cent. feldspar. The mineralization is fairly heavy, sufficiently so to give about $10 per ton. In trench No. 4 a similar narrow vein of pegmatite was observed, whose feldspar content is confined to a few small crystals along the wall of the vein. Alteration extends only about 2 inches from the walls, and mineralization is comparatively small. In the same trench a veinlet of quartz was observed, about an inch in width. On each side of it the rock is altered for a distance of about a foot, but the mineralization has been slight.

"The facts described appear to justify the following conclusions: (1) The ore bodies have been formed by solutions emanating from the dike or vein at their centres. These solutions have altered and mineralized the country rocks. (2) The tuffs may have been more easily altered and mineralized than the altered basalts. (3) The extent of the mineralization and alteration are related to the size and the composition of the central dike or vein. The strongest alterative and pyritizing effects have been exercised by the pegmatites, while the effects of the end members of the series, the porphyry dikes and the quartz veins, have been slight. The pegmatites containing 25-50 per cent. of feldspar appear to have produced the most powerful mineralization and alteration. Other things being equal, the extent of alteration and mineralization is roughly proportional to the size of the dike or vein. (4) The gold content of the dike and vein-forming solutions was also dependent on their composition. The pyrite deposited by the dikes of red porphyry contains relatively little gold. Gray porphyry dikes carried more gold, sufficient to give a good tenor within the dikes themselves, but not, apparently, to mineralize the surrounding rocks to any great extent. Pegmatites appear to have carried the maximum of gold, which they deposited as auriferous pyrite both in the veins and in the altered wall rocks; while the solutions forming the pure quartz veins carried little gold.

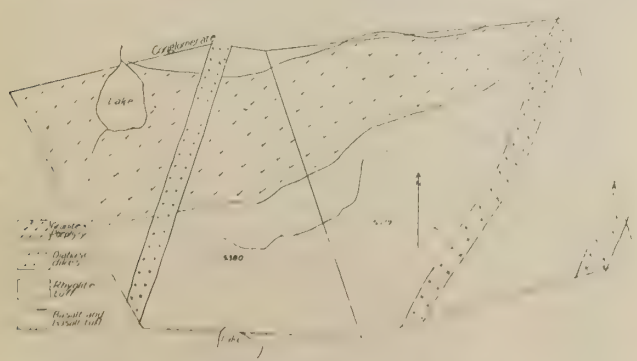

Fig. 4.—Geology of Otisse claims as shown by work done up to Oct., 1918.

"The only primary ore mineral present appears to be auriferous pyrite; however, a detailed study of the ores by the aid of the reflecting microscope has not as yet been made. If ore minerals other than pyrite are present, they are in minor amount. The gold occurs only in the pyrite, in what form is not known. Native gold is not found, except in oxidized surficial portions. In general a high pyrite content indicates a correspondingly high gold value, although in one or two places this has not proved true. In the pegmatites the pyrite is coarse-grained, in crystals and aggregates several mm. in diameter; but in the adjacent schsts the pyrite is always fine-grained, 0.3-0.5 mm. in diametr of crystal. Only in one case was this not found to hold good—in the ore body in trenches 14 and 15 peripheral to the dike or red porphyry in 15. There, the pyrite is very coarse-grained.

"The wall rock alteration accompanying the mineralization of the portions farthest from the central vein is seen to consist of calcitization, pyritization and sericitiation, with probably some albitization. Fine-grained magnetite originally present in the altered basalts in amount up to 5 per cent. is converted into sulphide, forming a few crystals up to 0.5 mm. diameter instead of a multitude of small grains. Possibly also some pyrite may be added. Feldspar, which is commonly oligoclase-albite either lath-like or irregular in shape, is entirely recrystallized into a fresh, clear, granular albite, with possibly a slight increase in soda content. Chlorite disappears entirely, while 10-15 per cent .of sericite is formed, and calcite, commonly forming 10-20 per cent. of the original rock, is increased in amount to 40 to 50 per cent. Nearer the central vein, under the more intensive action of the solutions, further changes take place. Albite and sericite tend to disappear entirely; a great addition of pyrite occurs, while the calcite content increases enormously, and may replace everything but the pyrite. A little quartz is sometimes present, but always in vague vein-like forms, and not a part of the true replacement. The pegmatite of the central vein itself also has very commnoly suffered a partial alteration, in a replacement of a part of its feldspar by calcite.

"The composition of the solutions which deposited the ores may be inferred from the results of their action on the country rocks. They were evidently rich in sulphur, and also carried iron. A great deal of carbon dioxide was present, and the lime content was high. They carried potash and soda, but probably only in small amount. They dissolved and removed silica, alumina, and magnesia primarily, while potash and soda were also carried away where the reaction was more intense, nearer the central veins.

Summary and Conclusions.

1. The internal structure of the ore bodies, consisting of a pegmatite vein at the centre, a middle zone of mineralized and altered rock, on each side, and an outer zone of altered rock without mineralization, which grades into unaltered country rock with irregular and embayed contracts, is clear evidence that the deposits in schist have been formed by the alteration and mineraliation of the country rock by solutions coming up along the central vein. The partial calcitization of the feldspar of the pegmatite indicates a change in the character of the solutions during the formation of the ore bodies.

2. The serial composition of the various veins of pegmatite, varying from veins of pure quartz up through pegmatites of increasing feldspar content, to dikes of pure porphyry, indicates an igneous origin for all.

3. The satellitic arrangement of the veins, in that with few exceptions they are grouped within an area bounded by a line drawn about 1,000 feet from the edge of the porphyry mass, with the major number within 500 feet, points conclusively to their genetic connection with the porphyry intrusive.

4. Veins or dikes approaching the porphyry in composition, deposited little or no gold, but did in places deposit pyrite. They had no strong alternative action on the wall rocks. Pegmatites deposited auriferous pyrite, and had a powerful alterative action on

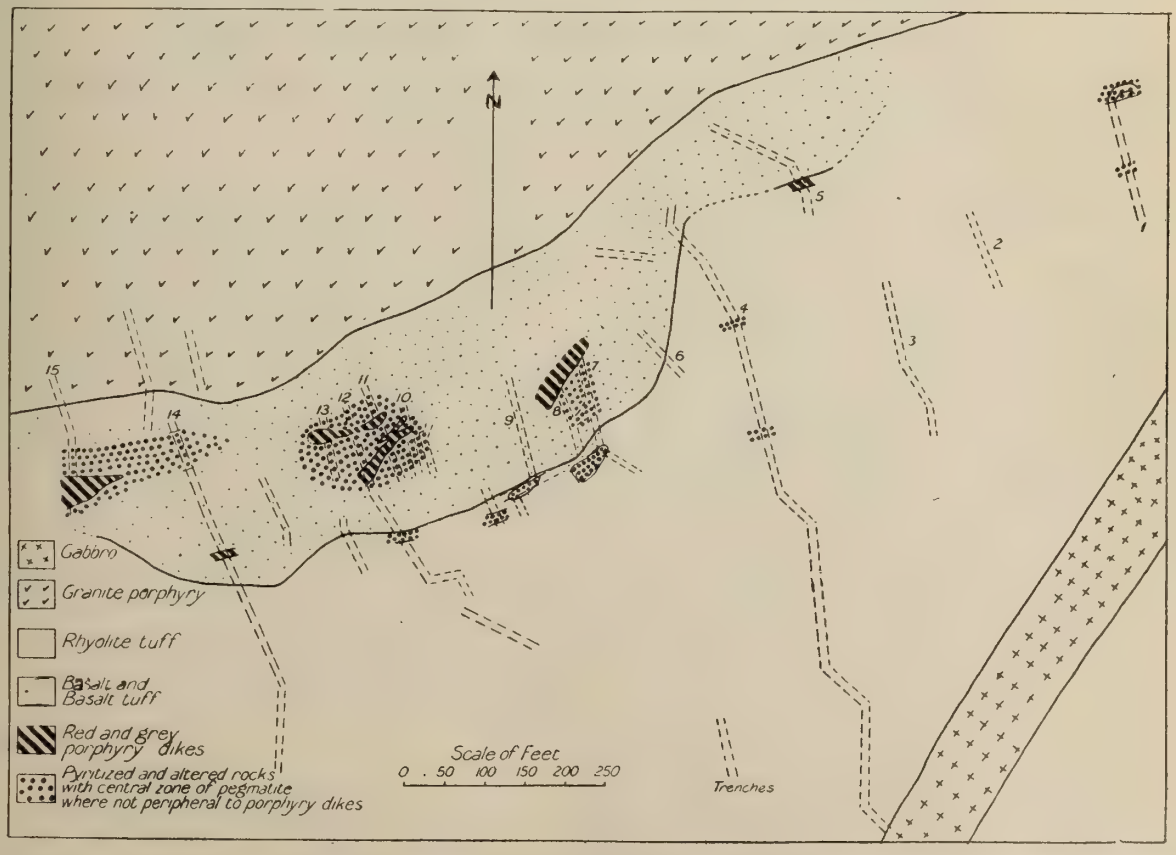

Fig. 5.—Sketch map of portions of claims 5379 and 5380, where the principal discoveries have been made. made.

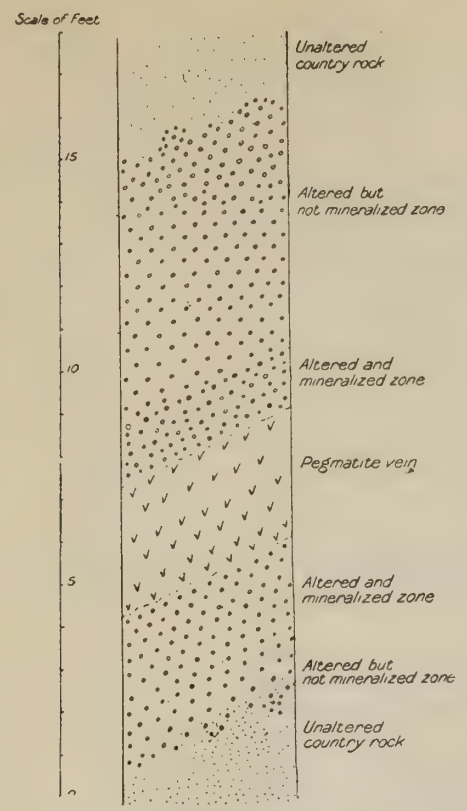

Fig. 6.—Sketch showing internal structure of orebody uncovered in No. 1 trench.

the wall rocks. Quartz veins had little action on the wall rocks, and deposited little or no pyrite. Other things being equal a rough proporton exists between the size of the vein and the size of the altered zone around it.

5. It is concluded, therefore, that the schist ores of the Matachewan district were deposited by juvenile solutions originating as the last products of the differentiation of masses of intrusive granite porphyry. The solutions were at first rich in silica, soda and alumina, which crystallized out first to form the material of pegmatite veins. The separation of these constituents left the solutions relatively enriched in lime, carbon dioxide, iron, sulphur, potash and gold, and their reactions with the wall rocks caused the formation of replacement deposits whose principal minerals are calcite and auriferous pyrite.

6. There is little direct evidence to connect the gold of the Davidson property with the porphyry, except the fact that the veins are confined within the intrusive mass. However, the proof that the neighboring stock, which is petrographically identical with the Davidson porphyry, carried gold, renders the conclusion inevitable that the gold of the Davidson property was also a magmatic constituent. The differentiation has here continued uninterrupted to the stage in which the mineral constituents of the magnetic solutions are silica and gold, and these are deposited as quartz with native gold.

The Oil Concession Correspondence

(Concluded from issue of July 2nd.)

THE CARVELL-MEIGHEN CORRESPONDENCE.

OTTAWA, 5th February, 1919.

My Dear Meighen:—

I am enclosing herewith some correspondence which speaks for itself, but perhaps I should say that, about a month ago, while in Montreal, I met Mr. Mathew Lodge of Moncton, who told me that an arrangement was now being made by which all the oil lands in the west should be handed over to one company for exploitation. I told him I had never heard of the matter before and am now in receipt of this correspondence.

I would be very glad indeed if you would let me know how the matter stands from the standpoint of the Government, and would ask you to kindly return the correspondence.

(Sgd.) F. B. CARVELL

February 8th, 1919.

Dear Mr. Carvell:—

I have yours of the 5th enclosing letter from Mathew Lodge of Moncton, N.B., with some clippings. I return the enclosures herewith as requested.

The Shell people made through their Canadian Agents two proposals in succession to me, looking to obtaining oil leases in the West on certain conditions. I definitely and finally refused each. Later, when in England, their representatives discussed the subject more fully with me and along wholly different lines. These at my request they embodied in a subsequent memorandum and definite proposal. I took this up with the sub-committee of Council and we reviewed the whole scheme, clause by clause. We decided, however, that as the resources might possibly be transferred at an early date to the Provinces, no step should in the meantime be taken. The last proposal of the Company has something to commend it, but I could not recommend it for acceptance at all, as it stands. The subject has never been considered in Council, and of course would be, before I would think of taking action.

I might say that I thoroughly agree that any Canadian concern should have ample opportunity to offer the like or better terms in any event.

Yours truly,

A. MEIGHEN.

More Correspondence.

Edmonton, Alberta, 16th Feb., 1919.

Hon. Arthur Meighen:—

Rumors persist here that whole north country to

be blanketed by shell oil contract. Political opponents propose protesting in Alberta legislature Monday. Can you give us any information; can we deny allegations in toto. Contract would arouse fierce opposition among all here. Wire reply.

A. T. ERVINE.

Telegraph.

Ottawa, 17th February, 1919.

A. T. Ervine, Edmonton, Alta:—

No concession granted Shell Company. Government has not yet considered Company's proposals.

ARTHUR MEIGHEN.

Ottawa, February 17, 1919.

Dear Mr. Meighen:—

I understand that the Royal Dutch or Shell Company have under way the leasing of large areas in Canada for the purpose of drilling for oil or natural gas.

Any information you can furnish me with regard to concessions granted this firm or applications under consideration will be much appreciated.

J. E. ARMSTRONG.

Ottawa, February 19th, 1919.

Dear Mr. Armstrong:—

You evidently had brought to your attention certain suggestions that appeared in the Press respecting the setting apart of large areas in Northern Alberta to be placed at the disposal of a company which dedesired to drill for oil and natural gas. There is no intention on my part to consider and proposition of that kind at the present time. Owing to certain representations made in some of the Western newspapers that the Government was giving way a very large territory for this purpose, many letter have been sent to me strongly objecting to the proposal. There is really no information I can furnish you in the matter other than above.

A. MEIGHEN.

Clerk Legislative Assembly.

Edmonton, Feb. 19th, 1919.

Sir:—

Last night I sent you the following telegram:

"I am instructed to wire you the following resolution, which was unanimously passed this day in the Legislative Assembly of the Province of Alberta.

"WHEREAS it is reported that the Dominion Government is about to grant extraordinary and exclusive concessions of petroleum territory in Northern Alberta to an Oil Syndicate on terms oppressive to the people of this Province.

"AND WHEREAS negotiations are pending for the transference of the Natural Resources of the Provinces.

"NOW, THEREFORE, be it resolved that in the opinion of this House no such disposition of petroleum lands or any other natural resources should be made."

Which I now confirm.

JNO. R. COWELL,
Clerk of the House.

Ottawa, 20th February, 1919.

Dear Sir Thomas:—

I have yours of the 19th with copy of a telegram received by you from J. R. Cowell, Clerk of the Legislative Assembly of the Province of Alberta, enclosed herewith. I have communicated with Mr. Stewart, the Premier of Alberta, expressing my surprise that such a resolution should have been submitted to the legislature based admittedly on a report, and which resolution assumes by its very wording an utter disregard of any sense of public duty on my part, and is intended to lead people to believe that some great wrong is about to be done, unless they take steps to avert it.

I have pointed out to Mr. Stewart that the application to which the resolution refers has not yet been introduced to Council, and that until the question of the natural resources has been settled, it is not my intention introducing it.

Yours very truly,

A. MEIGHEN.

Edmonton, Alta., Feb. 22nd.

Sir Thomas White, Acting Prime Minister:—

Large meeting of Citizens of Edmonton and Peace River Country unanimously protest against granting any monopolistic Concessions to Northern oil rights moved by Hon. A. G. McKay, seconded by James Ramsey, M.P.P., local members for city of Edmonton being requested to move for return of all papers of any such proposed agreement.

JOSEPH A. CLARK,
Mayor.

The Late W. J. Hanna's Letter.

Toronto, Ontario, March 1, 1919.

Hon. Arthur Meighen, Minister of Interior:—

Dear Sir:—

With relation to an application which I understand has been made through your Department on behalf of the Shell Transport and Trading Company for a reserve of 250,000 square miles, and a subsequent choice therefrom of 25,000 square miles of the potential oil territory of Alberta and Northwestern Canada, may I express my views as to the merits of the proposal laid before the Government and the menace to the country which it contains.

If I am rightly informed, this application is for an exclusive right to explore and exploit all that territory lying between the fifty-fifth and sixty-fifth parallels, bounded on the east by the eastern boundary of British Columbia. I must point out to you that this application constitutes an attempt to absorb, in one concession, all the potential oil land of Canada with some negligible exceptions. Of this I feel confident that I am correct, and confirmation of this belief, I am quite sure, would be forthcoming from the geologists of your own Department if the question were placed before them in a manner such that they could answer in general terms in and in the light of the knowledge available of the geology of Canada.

If, as I believe it to be the case, it is being implied that the applicants are venturing into unknown country in search of oil where it is merely assumed to exist, the implication is not consistent in view of the presence of volumes of compiled data, the product of years of research which have been piling up against the way of Northern Development in the Geological Department at Ottawa.

Or, if it is the intention of the applicants to have it appear that they are venturing into a wilderness toward the development of the resources of which noth-

ing had been done nor is likely to be done, except through their agency, then the credit that has been pledged by the Dominion of Canada and by the Province of Alberta in extending the railway lines to the great waterways of the north and the faith that has been demonstrated by the pioneers must surely have been hazarded in vain. I doubt very much if the Canadian people who have guaranteed these railways or the pioneers who have devoted the years to the opening of the North will view with dispassion any proposal to hand the greatest potential resource of the northern empire to a body of strangers attracted only by the possibilities made accessible and known by these pioneers.

Let me point out to you another aspect of the application. I refer to the size of the grant asked. I wonder if the applicants realize the extent of that for which they ask? A selection of twenty five thousand square miles (16,000,000 acres) of the best oil land within the dowry of Canada is what they ask. In the whole State of California, which produces a wealth in oil of one hundred million barrels a year, the second oil state in the American Union, the entire total area of oil land that is actually producing is not greater than one hundred thousand acres. In the State of Wyoming, which produces 40,000 barrels of oil a day, the whole producing area is not greater than twelve thousand acres. Just the amount that may be protected by one drill under the present regulation regarding leases in the country for which the application is made. The whole oil field of Western Ontario, from which millions have been taken and which is the source even to-day of the entire Canadian output, is not greater than thirty square miles all told. And yet me point out that there is not in the whole world to-day twenty-five thousand square miles of actual producing oil territory, including every acre in every latitude and in every country.

Until the application has been reduced to the form of an agreement it would be impossible to discuss its merits, but I feel that it should be realized that with the right of transfer, as asked for by the applicants, and with the privilege which such a right would entail of leading the profits through a number of subsidiaries before reaching the parent company, it would be possible that the announced profits of a parent company would not overcome the six per cent. cumulative which the applicants ask right to enjoy before sharing any part of the production with the Government of Canada. If a concession were granted on the tentative terms in which this application is made there would be a real danger that the Dominion of Canada would not receive a dollar therefrom.

It is being alleged in support of the application, so I am informed, that there is not the capital available to develop a Canadian Oil supply. In this connection I would like to point out to you that during this coming year the Imperial Oil Company is about to spend upwards of half a million dollars in the search for oil, a large part of which it is intended to devote to the territory for which this application is being made. This Company has on its staff some very competent geologists and has for the past five years had prospecting parties in the field. During the past two years, owing to the fact that some of the best men were called to the front, it has not been possible to carry this work forward as vigorously as would have otherwise have been done, but for this season the Company has already arranged for five field parties to leave Edmonton as soon as the snow is off the ground. These parties will be headed by competent geologists, fully equipped to gather the most reliable data upon the possibilities of the country. Coincidentally, it is intended to test with the drill every reasonable propect of oil located by the geological parties. Plant and equipment for this work has already been secured. Part of it (two rigs) are already at Edmonton, where they have been since last autumn, and the remainder is forthcoming.

This exploratory work is not a new departure upon the part of the Imperial Oil Company. Realizing the importance of developing a Canadian oilfield, the company has for a number of years been active by drilling in the search for oil. Last year operations were carried out in the Fort McMurray district, and for three years past operations have been in progress in the Viking district, both in Alberta. The former operations were within the boundary of the concession applied for by the Shell Company. In the Peace River country, also within the limits of the concession asked, the company, through agents have taken up a considerable area of oil leases and has subscribed to assist local companies in their drilling operations. In the Great Slave lake and McKenzie River districts, beyond the Northern Boundary of Alberta, but still within the limits of the concession asked, the company has had extensive geological search made, and as a consequence of the information brought in it is proposed this summer to send two rigs north by boat to points hundreds of miles beyond rail-head on the Athabasca.

I am speaking not only of what is being done by the Imperial. I am not in a position to speak with authority for anyone else, but in addition other individuals and syndicates amply financed have been active in the Peace River country and there are indications that there will be great activity and healthy rivalry during the coming summer. The allegation, therefore, that the capital is not available to develop the oil field has no basis in fact.

In speaking of these operations by the Imperial in search for oil, I would like to point out to you that any rights which the Imperial has acquired by the way of drilling leases has been the outcome of no special privilege. There have been no concessions of any kind granted to this company, nor have any been asked. We have always felt that under the law as it stands now there is reasonable latitude for any company, large or small, which has a desire to prospect for oil and we will never seek, by way of special privilege, any right which it is not open for others to enjoy. We feel that this policy, which has heretofore been pursued by the Government, will lead most quickly to the development of the oil resources of Canada.

As a grant such as that asked for would place the applicant company in a position of holding and absolute monopoly of the oil business through ownership of the oil resources of Canada. I feel that I cannot allow the application to go to consideration without outlining what the granting of such an application would mean to this company.

You are doubtless aware that the Imperial is an old-established institution, having been incorporated in 1880, and is to-day the second largest among Canadian concerns, admitting first place only to the greatest of Canadian railways. In four years, since the opening of the war, it has paid into the Dominion Treasury in the form of duties and revenues $7,433,707.75, and in taxes of various kind to various municipal and gov-

ernmental authorities in the same period upwards of $3,250,000. It furnished the Imperial Government during the war with 110,810,540 imperial gallons of oil fuel for the British Admiralty. To provide for urgent requirements of the Admiralty and to keep pace with the industrial demands during the war period, and with no balking at tremendously increased cost of construction, the Imperial has, during four years, outlaid on new plant $20,175,954.76 and has invested in buildings $575,812.76. From a purely pecuniary point of view the company could have profited by allowing this new construction to wait until the conclusion of the war had brought costs to a lower level, but assumed these larger capital expenditures rather than see the war work suffer handicap through shortage of supply of oil or for lack of service.

In the Imperial all employees are given an opportunity to become stockholders and a large percentage, both operatives and clerical staff, have done so, and the number is steadily increasing. Five hundred Imperial employees entered military service, and the company from a special appropriation has supplemented their army pay in a way that has been greatly appreciated by the men and their families. During the same period it has provided liberally for its injured workmen, and it carries a sick benefit and retiring allowance plan which protects everyone of its people from want or the fear of want during the entire term of their working years and for as long as they live after the term when, at 65, they become time-expired men in the industrial army of Canada.

The company have refineries at Vancouver, Regina, Sarnia, Montreal and Halifax; has eight hundred distributing stations located at points calculated to best serve its customers; it has eleven ships on the Pacific, Atlantic and Great Lakes and in the midst of stress of war-time conditions it has kept unfailingly supplied the farm tractors of Western Canada, the fishing fleet of the Pacific Coast, the Mountain railways and in fact every activity essential to Canada's part in the war and all this has been done during the entire war period in the spirit that the necessities of the case were the first consideration, the profit secondary.

The Imperial has an investment in the oil business to-day of not less than ninety millions of dollars and within the past five years its stockholders have put in a new money—all cash—$20,340,000. More than two dollars for every one dollar they have taken out.

That an industry touching as it does so intimately the welfare, business and livelihood of thousands of people should be subjected to threat of incursion and raid, such as could not fail to prejudice an investment built up over half a century and to handicap the steady flow of products from producer to consumer, to the loss and embarrassment of all, cannot be in the Canadian national interests.

You will no doubt recognize the effect that the circumstance of such an application as that made by the Shell Company being publicly regarded as under official consideration must inevitably exert upon the further enlistment of capital in the oil industry in Canada, and you will appreciate that the granting of such a concesison would be very nearly equivalent to a destruction of the entire present investment in the Canadian oil industry. I do not for one moment think that the Government of Canada contemplates such a proceeding, but I think it well, nevertheless, to so place clearly before you the inevitable result of such an act. I, therefore, submit the foregoing for your consideration.

Yours very truly,
(Signed) W. J. HANNA.

The Proposal is Not Accepted.

March 28th, 1919.

Dear Sir Reginald McLeod:—

Referring to application of the Shell Oil Group with respect to certain areas in the northern portion of Alberta, and the Northwest Territories adjoining such Province, and the carrying on of oil development there on co-operative basis with the Dominion Government, I have to say that this Department cannot recommend acceptance of the proposals you have submitted.

Yours very truly,
A. MEIGHEN.

Paris, March 30th, 1919.

Prime Minister, Ottawa:—

X185, for Meighen.—Sir Reginald McLeod on behalf of Shell Transport and Trading Company called on me to-day and expressed earnest hope that early decision will be reached as to Company's proposals. He claims that there are other theatres to which they desire to divert their energy without delay if Government decides not to accept their offer.

BORDEN.

Ottawa, 31st March, 1919.

Sir Robert Borden, Paris, France:—

Have decided cannot entertain Shell Company's proposals and notified them some days ago.

MEIGHEN.

PERSONAL.

Mr. A. A. Hassan has opened an office at Fort Worth as geologist.

Mr. George Rogers has resigned as manager of the Churchill Mining Company. Mr. Rogers is in charge of operations at the Wasapika, Westree and Herrick properties in the Wasapika gold area.

Mr. F. W. Gray is visiting the Cobalt silver and Porcupine gold districts.

Mr. R. E. Hore has returned to Toronto after visiting the Huntingdon copper mine near Eastman, Quebec. He is now visiting gold and silver mining districts in Northern Ontario.

Mr. F. M. Connell is at the Huntingdon copper mine, preparing for the resumption of operations there.

Lieut. H. K. Bowen, retired from the R. A. F., has just returned from overseas. Previous to enlisting for active service Lieut. Bowen was in practice as a mining engineer in the north country, and will shortly resume his work there.

Mr. H. J. McCann, has been transferred from the position of Purchasing Agent of the Dominion Steel Company at Sydney to the Montreal office of the Dominion Steel Corporation as Assistant to the President. Mr. McCann has been connected in various capacities with the Dominion Coal and Dominion Steel Companies for the past twenty years, and he has a comprehensive knowledge of the operations and commercial conditions in both the coal and steel ends of the business.

Oil Notes

IN THE PERSIAN OIL-FIELDS.

One drops down from the Imam Riza to the coal-fields. They lie in a Q-shaped cup, and the tail of the Q leads up from Tembi, where the power-house is at the foot of the pass. Two enormous columns of smoke told us where the wells lay. It was escape oil burning. The pipes, which had been cut by the Bawi and Anafizah tribes near Ahwaz in the disturbances of February, were still under repair. Meanwhile the oil which ought to have been feeding the refineries at Abadan had to bee dstroyed. Where there is a good flow, as at Maidan-i-Naftun, the oil floods up and discharges itself at high pressure into the pipes, and is carried by its own momentum into the storage tanks. No pumping is neded. The only difficulty is to control it. To close a valve in the pipe at the surface of the well is simple enough, but it is seldom wise, as the subterranean force which you have unloosed is eccentric and not easily disciplined. A block is apt to disturb the strata and plug up the channels, and create a commotion which may put the well out of action for weeks. So, when the passage to the refineries is stopped the oil and gas are carried off into side pipes and burned. The immense columns of smoke and flame where the escape oil was burning day and night depressed me with an uncomfortable sense of waste. The flames leaped up 60 feet in the air in a circumference of 20 with a roar like breakers, and above them rose a solid column of blue smoke. At a certain height it caught the breeze and was deflected, but it was still so dense that riding under it a full 500 yarns from the flame one felt protection from the sun. The manager laughed at my economical scruples: "If you were a millionaire," he said, "you wouldn't mind if your butler opened an extra bottle of port. Besides, where could you store the oil? It would soon flood a respectable valley.

The oil, it seems, is inexhaustible, and if you humor it and give it its head underground it is singularly docile when it reaches the upper air. Its violence is all subterranean, and the miners' chief anxiety is lest it should spurt up in sudden gushes and carry away rig and derrick. Once above ground it finds its way to the storage tanks and power house. From the pumping station at Tembi it is lifted over the two ranges, the Imam Riza and the Tul-i-Khayyat; and from the second ridge it flows without obstruction to the refinery at Abadan on the Shatt-al-Arab, 142 miles from the fields. The pass over the Tul-i-Khayyat is 1,300 feet, and the pressure on the pipes here is 600 pounds to the square inch. One is struck by the economy of transport. Oil, unlike other products of mines, needs no railway with its costly rolling stock, imported fuel, and gangs of workmen. It supplies its own power like a rational monster pent up in the bowels of the earth and ready to lend a hand in its own release. Both in production and in transmission you have the same economy. Where a well is being bored you will find under one rig a single white mechanic and half a dozen wild-looking Bakhtiari assistants, whose limbs remind one of figures on a Greek frieze. The driller and the tribesmen communicate in a jargon which is neither English nor Persian, but understood by both. It comprises half a dozen adjectives very forcible and explicit, the single inflection of some three common verbs which does duty for all tenses and moods, and a number of substantives mostly of a highly technical kind. The Lur or Bakhtiari in the Persian oil-fields is as familiar with spudding shoes, clamps, gauges, underreamers, and bits as the product of a Schenectady engineering school.

I was taken to a rig where a Canadian was fishing for lost gear. In boring the shaft the heavy blunt-nosed steel bit which pulverizes the rock is attached to the sinker, a sixteen-foot steel rod. This is connected with the wire rope by jars and swivel, and suspended from an oscillating walking beam which overhangs the shaft. The process of boring is simple so long as the string of tools hangs together, but the wire rope, sockets, jars, sinker ,and bit are put to an inordinate strain; and if any of these give the shaft is blocked and work comes to a standstill. Another source of trouble is when the casing of the shaft gives through heavy earth or gas pressure, or the parting of the joints. In any of these emergencies the driller has to lay aside his tools and fish. He may fish for months and not recover the lost part. In that case it is a question of a new shaft and the abandonment of the well—a tragedy of wasted labor, which is the worst thing that can happen to the mining engineer.

I found the Canadian solemnly and patiently fishing while the half-naked Bakhtiaris sat round him wistfully looking for a sign. The trouble had begun two months before with the breaking of the sand-pump, the cylindrical vessel which is lowered after every foot or two of boring to remove the pulverized debris. The pump had broken off and carried away some of the steel rope with it. The driller's first business was to fish for the gear with a tenacious barbed and pronged instrument known as the rope-spear. This he attached to a sinker and let fall heavily among the strands of the cable. He secured his grip, but the pump was so firmly imbedded that it would not give. It was impossible to shift the thing without breaking the line. Heavier machinery had to come into play. So the engineer cut the rope just above the swivel and ran in a series of iron fishing poles with a socket at the end to catch hold of the sinker to which the rope-spear was attached. The bottom pole gave with the socket. Thus the history of the House that Jack built repeated itself, only none of the parts played their part, and every lap in the story was a coup manque. We have now in order from top to bottom—the iron fishing pole with the socket which would not catch the sinker, the swivel and sinker, the rope-spear, the sand-pump, all lying in layers of obstruction some thousand feet underground, blocking up the shaft. It was enough to take the heart out of a man, but the Canadian went on stolidly fishing, and the Bakhtiaris squatted on the floor of the rig loking dully expectant. After a month the Canadian dragged up the sand-pump, which ought by all rules of the game to have been at the bottom of the whole bag of tricks. His next catch was the swivel, which had parted from the sinker. Then he brought up the pole and socket. There remained the sinker and the rope-spear. These, as far as I know, were never recovered. They were probably jammed into the side of the shaft, for when next I heard of the well drilling had been continued. That Canadian fishing for his tools was the most monumental instance of patience and faith I have witnessed.—Edmund Candler in "Cornhill" (Extract.)

Nova Scotia Notes

Dominion Coal Output.—For the first half of the year the production of the Dominion Cape Breton collieries was approximately 1,537,000 tons, being 150,000 tons below the outputs of the first half of 1918. The Springhill Mines in the corresponding period produced 185,500 tons this year, and 201,752 tons in 1918.

It is understood that several of this company's coal freighting vessels have been released from requisition by the British Admiralty, and if this news is confirmed, there is a prospect that the mines may work more regularly than they have during the month of June, when production from the Cape Breton collieries reached only about 220,000 tons, or half of capacity of the mines.

Mr. Walter Herd, who was formerly the Assistant Mining Engineer of the Dominion Coal Company, has returned from overseas and has been appointed as Mining Engineer. Mr. Herd was one of the men selected by the Canadian Mining Institute for nomination to commissions offered to qualified mining engineers by the Militia Department early in the war. Before leaving Canada he was transferred to the Forestry Corps, in which he performed important duties, and was promoted to a lieutenant-colonelcy. Mr. Herd has had wide experience in coal-mining in Scotland and South Wales, and during his service with the Dominion Companies has ben successively in charge of operations at the Springhill Mines, and at the ironstone mines at Wabana, Newfoundland. Mr. Herd's experience in undersea mining is very extensive, and he has also had acquaintance in the mining simultaneously or in close succession of coal-seams separated by a thin layer of measures. The problems connected with undersea mining and with the extraction of closely-superimposed coal-seams separated by a thin layer of measures. The problems connected with undersea mining and with the extraction of closely-superimposed coal-seams are prominent in the areas of the Dominion Coal Company, and in this regard, as in other ways, Mr. Herd is well qualified for his new position.

Acadia Coal Co.—This company has the distinction of being perhaps the only coal producer in Nova Scotia to show an increase in its output for the first half of the year. The production for the first six months of 1919 was 190,000 tons, about, which compares with 111,063 in the first half of 1918. The present rate of production does not, however, represent full-time work for this companies collieries, and the difference in favour of 1919 is due chiefly to the explosion in the Allan Shaft Mine, which disorganized production in the first half of 1918.

Intercolonial Coal Company.—The output of this company for the first half of the year was about 90,000 tons, which compares with 102.14 8tons in the corresponding period of 1918.

Nova Scotia Steel & Coal Co.—Production at this company's collieries closely approached that of the first half of 1918, being 245,000 tons for the current year, against 257,788 last year. Some irregularity in work may be expected in the near future during the continuance of the shut-down of the Steel plant at Sydney mines. Production at the collieries of Scotia has been very good recently, the output on one day in June reaching 2,522 tons.

Inverness Coal & Railway Co.—The production of Inverness mines was for the first half of 1919 about 69,000 tons, comparing with 108,282 tons in the first six months of 1918. Mr. John McGillivary, who has for a number of years been in charge of the operations of the mine and railway at Inverness, and who latterly has been acting at General Manager and Receiver, has resigned, and has been appointed to a position with the Canadian National Railways at Toronto. Mr. McGillivary has been a careful operator, and has kept the Inverness Colliery and Railway in operation under some exceptionally adverse conditions. Recently the Eastern Trust Company applied for permission to foreclose the mortgage on the properties, and in the meantime, negotiations have been proceeding between the Federal Minister of Railways and the Commissioner of Mines of Nova Scotia. It is now announced that the Government will take over the railroad on the same basis on which other roads in Nova Scotia have been taken over, and that a weekly order for 1,800 tons of coal for the National Railways is to be given to avoid the closing-down of the mine.

The aggregate production of the Nova Scotia collieries for the first half of 1919 is not exactly ascertainable, but is in the vicinity of 2,450,000 tons, and is about 150,000 tons below the production of the first half of 1918. From present indications and the known prospect of the future it would seem that the production for 1919 cannot exceed from 4¾ million to 5 million tons. The impression obtains that improved demand for coal will present itself about September. It is really more a matter of transportation than demand, however, and if the Dominion Coal Company can obtain release of its steamers, and can secure sufficient tonnage at freight rates which will permit of carrying coal to Montreal at saleable prices, then the pressure on the smaller companies will lessen, and business will revive locally.

The disinclination of the Board of the National Railways to pay the price for coal that the cost of production in Nova Scotia at the present time requires has been the subject of very vigorous resolutions by the miners' unions, and, in response, some unusually straight talk is being ascribed to the railway officials in semi-offcial communications emanating from Ottawa and appearing in the newspapers. The railway people say "we are running the railways as a business proposition, and, in competition with other railways, must buy coal in the cheapest market." Many considerations are involved in this statement, and for one thing it clearly discloses the difficulty which besets men who endeavour to run a state-controlled enterprise on business lines. It is doubtful whether in a country which has in the past approved of political patronage, and in which a quid pro quo has been the normal accompaniment of electoral approval, it is possible to do any such thing. Much more vital considerations, however, are involved in any matter that concerns the coal production of Canada at this time, conditions which may properly over-ride the question of price. Price is probably the least consideration in connection with coal production to-day, chiefly because no one really knows just what a dollar is worth. One thing is sufficiently clear, namely, that a Canadian dollar will not purchase a dollar's worth of United States products to-day, and every cent that is ex-

pended outside of our own borders unnecessarily increases the Canadian disadvantage.

The semi-official communication from Ottawa referred to states further:

It is doubtful if the decrease in output of the Cape Breton mines is at all due to decrease in coal supplied the Government railways. In the Capital, it is believed it is due entirely to labor unrest, which has had a deterrent effect on industrial progress and on the building trade. Sydney coal troubles are the direct effect of the attitude of labor throughout Canada. Owing to the unrest, the building programme projected in Canada last spring has been reduced by sixty per cent., and individuals and corporations refuse to increase plants or take extensive orders, owing to the uncertainty of the labor supply.

The situation in Sydney is viewed here as an indication of what may be expected in other centres this autumn and the coming winter. It is felt that the penalty must be paid for the unrest this summer throughout Canada and for the lack of thrift during the period of high wages and constant employment.

Presumably this is Ottawa's retort to the resolutions stated to have been passed by representatives of the miners in Sydney, protesting against the action of the Government in arresting the Winnipeg strike leaders, and practicaly asking for the confiscation of capital. The statement is not characterised by restraint, and to say that Sydney coal troubles "are the direct effect of the attitude of labour throughout Canada" is to mix a modicum of truth with a great deal of error. A statement by the local representative in the House of Assembly gives with exactness the specific causes for the slackness of work in the Cape Breton collieries at the present time. Mr. D. A. Cameron, M.P.P., stated that the following causes were responsible, namely:

Requisition by the Imperial Government of ships which were formerly engaged in the St. Lawrence trade. Even if ships are obtained for the St. Lawrence trade again, freight rates would be prohibitive unless the pre-war charters were held to. A second is the increase of freight rates which has been made by the C. N. R. The third factor, Mr. Cameron said, is that the cost of coal at the pit mouth in Nova Scotia exceeded the cost of American coal delivered as far east as Montreal, and probably as far east as Campbellton, N.B.

Mr. Cameron might have added that the increase of freight rates on the Canadian National Railways is a direct result of the increased cost of coal production.

MONTAGUE GOLD MINING CO., NOVA SCOTIA, MAKING STEADY PROGRESS.

Mr. E. S. Romilly Smith, General Manager of the Montague Gold Mining Co., brought from Montague recently some wonderfully fine specimens of gold quartz from the company's property, specimens which reminded those who saw them at the office of the old days of the Annand and Rose properties, both of which mines are now included in the Montague Company's holdings of about a mile and a half square in extent. The specimens show gold jutting out all over them, and include a fine nugget. The company has spent the past twelve months developing and has cut five new leads on the 300 foot level, having now sufficient ore blocked out to keep the ten stamp mills continuously working for about twelve months approximately. If it were not for the set back experienced at the mines through the explosion of December, 1917, which smashed up the mill and machinery, work would have been in fuller swing now, as a result of the great and successful development. The company has now control of practically the whole Montague gold district for about eight years.

Mr. Smith is leaving on the Olympic on the 15th for England on a business trip, and will return in October, bringing his family to Montague with him, they having been unable to come to Canada during the war operations. While in England he will arrange for the installation of a new stamp mill and other machinery necessary to meet the requirements and bring the plant right up to date, the property having been thoroughly proven after having been worked five years by the company. In the meantime there will be no let up in work at the mines, but the present plant will be used to capacity pending installation of the new machinery. The new plant will include probably a ten stamp crusher of 1,600 to 2,000 pounds stamps as preliminary crushers, and Huntington mills will complete it with Wilfley tables and five vanners for salines, etc.

The company has ever been thoughtful of its employees at Montague, and a noticeable feature has been supplying the families with houses free of cost. They are now contemplating erection of a number of cottages and a boarding house for their employees.

Mr. A. Gerhardie, who has been associated with Mr. Smith in the mining management, has been appointed mine manager, and under his direction, he being a good mining man of much experience in different parts of the world, including South Africa, it is expected continued rapid progress will be made both in development and output during Mr. Smith's absence.

The company opened their mining operatons at Montague on the Seymour Kaye property, and have since acquired adjoining properties. Their miners are still working below the "break," and are in virgin soil. Montague is one of the few gold mining districts in Nova Scotia that has come back strong, and the depth at which the Montague Company's operations have located such good paying ore would seem silent testimony as to the great possibilities of deep mining.

The company has recently acquired the whole of the Roderick McDonald areas, adjacent to its own, and now has virtually all the great properties in the Montague gold district.—Halifax "Chronicle."

It is reported that a rich lead of manganese was discovered at the New Ross Mine recently. The new lead was located but a few feet from the surface, and is said to be oen of the very finest quality.

REPORTED DISCOVERY OF OIL ON VANCOUVER ISLAND.

(From our British Columbia Correspondent.)

Oil is said to have been discovered on the west coast of Vancouver Island, petroleum records having been registered in the name of David Logan, a lineman in the employ of the Dominion Telegraph Service, with residence at Clo-oose. Mr. Logan states that he has found large seepages and has taken some samples to the town of Port Alberni for assay.

Special Correspondence

BRITISH COLUMBIA.

May Coal Production.

The output of the coal mines of British Columbia for the month of May was 187,726 tons made up as follows:

Vancouver Island.

	Tons.
Western Fuel Company, Nanaimo Collieries...	48,012
Canadian Collieries (D), Ltd., Comox Collieries.	44,297
Canadian Collieries (D), Ltd., Extension Collieries	20,068
Canadian Collieries (D), Ltd., So. Wellington Collieries	7,783
Pacific Coast Coal Mines, Ltd., Morden Colliery.	6,170
B. C. Coal Mining Co., East Wellington	1,508
Nanoose Collieries, Ltd., Grant Colliery	397
Granby Consolidated M. S. & P. Co., Cassidy	6,887
	135,122

Crow's Nest Pass Collieries.

Crow's Nest Pass Coal Company, Coal Creek Colliery	26,064
Crow's Nest Pass Coal Company, Michel Colliery	14,024
Corbin Coal & Coke Co., Corbin Colliery	4,287
	44,375

Nicola-Princeton District.

	Tons.
Middlesboro Colliery	3,108
Fleming Coal Co.	2,649
Merritt Colliery	771
Coalmont Colliery	706
Princeton Colliery	1,095
	8,229

Coal for the new bye-product ovens of the Granby Consolidated at Anyox, B.C., is being supplied from the Cassidy Collieries, Vancouver Island, where a new mine has been opened, a modern plant installed, and provision made for the housing of employees in a manner never before undertaken on the Pacific Coast. Cassidy's is considered an ideal coal mining centre and its output is constantly increasing.

Groundhog Coal Fields, Northern B.C.

The revival of interest in metalliferous mining throughout the Portland Canal District, northern British Columbia, has directed attention again to the Groundhog Coal Fields, as they are coloquially termed. These fields are situated about 90 miles from the mining town of Stewart and the coal, judging from the available reports, is of the highest quality and very plentiful. To open up the field found railroad construction would be necessary and in this connection three feasible routes are being discussed. The shortest would be from tidewater up the Naas River, but it from which point a railroad has been built fifteen miles in the direction of the coal fields. Another route would be from tiewwater up the Naas River, but it is pointed out that this would be eighty miles longer. As against the handicap of distance, however, there would be less rockwork and an easier grade. A third possible route is from the G. T. P. Railway at Hazelton, about 150 miles southward. The Groundhog Coalfields have been reported upon by a number of engineers and are known to extend some seventy miles, the strip being over thirty miles wide over which coal outcrops in different places.

Wellington and Canadian Collieries vs. Pacific Coast.

The action of the Wellington Colliery Co., Ltd., and Canadian Collieries (Dunsmuir), Ltd., vs. Pacific Coast Coal Mines, Ltd., has been before the British Columbia Court of Appeal. In the lower Court Mr. Justice Murphy found for the plaintiff whom he allowed $84,000 damages for trespass in taking coal from the property of the Wellington Collieries and the Canadian Collieries. It may be explained that the properties of the respective companies are situated on Vancouver Island and are adjacent to each other. The defence was that W. Coulson, late manager for the Pacific Coast Coal Mines, Ltd., and now deceased, had given permission for the so-called trespass and for the taking from the plaintiff's property of a certain amount of coal. After hearing argument the Court of Appeal reserved its judgment.

Robert Henderson, fire boss at the Harewood Mine, Canadian Western Fuel Company, has been appointed manager of that mine, vice-president Richard Batty, resigned. Mr. Henderson formerly was manager at No. 4 mine, Canadian Collieries (Dunsmuir), Ltd., Cumberland.

Grand Forks Smelter & Phoenix Mine Closed Down.

The Granby Consolidated Mining, Smelting and Power Co., Ltd., has discontinued operations at its Grand Forks Smelter and Phoenix mine, and it is believed that the close down is permanent. The immediate cause is lack of coke owing to the strike in the Fernie coal fields. It had been the intention of the company to continue operations until the fall at least so that the trouble at Fernie has only hastened what was looked upon as inevitable. The company is offering all employees at Grand Forks and Phoenix free transportation to Anyox and positions with the company at that place. Among the Phoenix miners and business men there is a persistent feeling that Phoenix will rise again from its Granby ashes. It is pointed out that while the camp is closed the machinery is not being removed, the only exception being that of a few ore crushers. While the Great Northern Railway will pull up its tracks, the C. P. R. it is pointed out will not do so. Attention in this connection is directed to the report of the Granby Company of last June, which states that there were then 3,274,966 tons of ore remaining in the Phoenix mine. Since that time it is estimated that about 150,000 tons have been mined and smelted. On that figuring, therefore, there are about 3,000,000 tons still left. This, with the possibility of new development inclines those with confidence in the camp to the belief that the Consolidated Mining and Smelting Company of Canada is likely to step into the breach and to continue mining operations in the district.

Anyox Smelter Expects Great Increase in Copper Production.

That the Anyox Smelter of the Granby Mining and Smelting Company will produce twice the amount of

copper that has been turned out heretofore and may ultimately produce 100,000,000 pounds a year, is a statement credited to Dr. M. E. Nichols, President of the Company, on returning from a recent visit to Anyox. The optimism of President Nichols is believed to indicate the development of satisfactory conditions in some of the properties acquired recently among which is a group on Oxtall River, B.C., held under bond. The ledge on the Oxtall is said to be enormous. It is being developed by diamond drilling this year.

Consolidated Mining and Smelting Buy Claims in Sibola Country.

The Consolidated Mining and Smelting Company has bought five groups of claims in the Sibola country, situated twenty miles north of Sibola mountains and one hundred miles from the Grand Trunk Pacific Railway, and both silver-lead ore and silver-copper ore have been found on the property. The consideration is said to be in the neighborhood of $250,000.

Activity in the Alice Arm District.

There is much mining activity in the Alice Arm District, Northern British Columbia. The Taylor Engineering Company, which has taken over the mine and railroad of the Dolly Varden Mining Company, is engaged in preparing to put the mine on a shipping basis. The two miles of railroad necessary to complete the line from tidewater to the Dolly Varden mines is being rushed to completion. Owners of other mining companies in the vicinity also are busy. Both the North Star mine and the United Metals mine have ore ready for shipment as soon as transportation facilities permit it being moved. Reports received from the north indicate that a consolidation of mining properties is likely to be effected. W. R. Tonkin and W. W. Warren, representing United States capital and John Peterson of Stewart, are reported to have bonded the North Star, the Vanguard, the Last Chance and the Second Thought. It is said that about half a million dollars is involved in this transaction. W. Somerville has bonded the Homestake mine and the Musketeer has been bonded by L. Meekin. A working option on the Ruby mine, situated opposite the Dolly Varden has been taken by the Taylor Mining Company, a subsidiary concern to the Taylor Engineering Company. The Temiskaming Mining Company of Cobalt, Ontario, from all accounts, is still interested in the District and is likely to take over the Moose group.

NORTHERN ONTARIO.

Kirkland Lake District.

The feeling is getting abroad that at least some of the mines in the Kirkland Lake camp may soon begin to employ a limited number of men, preparatory to once more starting operations at the same rate of pay and under the conditions which prevailed before the labor strike was called. A number of the men have signified their willingness to return to work on the old basis.

A reconsideration of the entire situation, viewing the economic side of the question as it applies to precious-metal mining, may with reason serve to bring about a change in the attitude of the mine workers, and the possibilities of an early resumption of work in the Kirkland Lake field is decidedly more promising than at any previous time since the declaration of the strike.

The strike has caused more or less inconvenience in cases where property is held under working option and where the option agreements do not protect the purchasers in case of enforced curtailment due to labor strikes. As long as the strike continues only three courses are left. The purchaser must either seek an extension of time covering the duration of the strike, failing which he will be obliged to either abandon the option or meet the obligations incurred without the opportunity of carrying out the proposed work of exploration. The latter course, in the majority of cases, would be very improbable. Indeed, in some cases, would be impossible, especially where the agreement specified the amount of work to be done each month. Among the properties affected by this phase of the situation is the Ontario-Kirkland, which is held under working option by the Crown Reserve Mining Company of Cobalt.

Mill heads at the Kirkland Lake Gold Mines during the two and a half months of operation prior to the labor strike, were comparatively low, according to information received from a usually well-informed source.

In a recent interview, Frank L. Culver, president of the company, refused to commit himself to any statement with regard to the average grade of the ore as so far determined. However, unofficial reports indicate an average gold recovery of a little under $5 to the ton.

From definite statements made by Mr. Culver concerning ore at depth, and the general physical condition of the mine, the result of future mill operation should be decidedly more satisfactory.

The Bush Fires.

Bush fires throughout the north which had gained threatening proportions during first three days of July, and had resulted in the destruction of the mining and milling plant of the Patricia Syndicate at Boston Creek, were subdued somewhat by rains which began to fall on the morning of July 4th. At the time of writing, these fires have died down.

The destruction of the mining plant and mill of the Patricia Syndicate at Boston Creek was the only mining plant lost as a result of the forest fires which broke out in various parts of the north early in July. The mill had been closed down for some time. It had a rated capacity for treating about 30 tons of ore daily, and is stated to have had a value of about $70,000.

Reports were in circulation with regard to the mill of the Dome Lake being destroyed, but this report was erroneous, the plant never being even threatened with bush fires. Late in June a small fire broke out in the pump-house, and did some damage, and it would appear that from this the other more serious reports took their root.

Misrepresentation re West Shining Free Gold Area.

Resentment is being openly expressed by mining engineers and geologists at the fact that promoters of unproven prospects in the West Shining Tree gold area are using the names of these men in connection with promotion literature that is in some instances at once misleading and incorrect.

It is freely admitted that the favorable geological conditions, and the rich patches of ore found in more or less narrow pay-streaks in the veins so far opened up, lend to the district a considerable amount of prospective merit. Beyond this no man can venture a definite statement.

FOR SALE

2 Norwalk straight line three stage Compressors for charging air locomotives, having compound steam cylinders and two flywheels.

Air pressure 800 lbs. Steam pressure 110 lbs.
Size of steam cylinders—High pressure, 20 ins. diameter. Low pressure, 38 ins. diameter. Stroke, 36 ins. diameter.
Size of air cylinders—23 ins., 16 ins., and 8 ins. in diameter.

ALSO THE FOLLOWING LOCOMOTIVES:—

Maker	Size	Description	Dia., Driver	No. Wheels	Wheel Base	Weight	Length Overall
2 Porter	7″ x 12″	Simple	23″	4	4′0″	14000	13′4″
4 Porter	10½″ x 14″	”	26″	4	5′3″	30000	19′4″
2 Porter	7″ x 14″	”	24″	4	5′3″	20000	18′0″
1 Baldwin	11″ x 14″	”	28″	6	6′6″	40000	22′8″
1 Baldwin	11″ x 14″	”	28″	6	6′5″	34000	19′8″
1 Baldwin	9″ x 14″	”	28″	4	5′6″	25000	17′0″

These locomotives are 3 ft. gauge and have a clearance height from top of rail of 4 ft. to 5 ft. 2 in. This machinery is all in working order and is open to inspection at Glace Bay.

DOMINION COAL COMPANY Limited, Glace Bay, N.S.

GENERAL MINING NOTES.

The Rio Tinto group of claims, which are situated on the same vein as the Electric Point Mine at North Port Washington, has been sold by J. H. McDonald, of Rossland, to American capitalists. Recent development work on this property has revealed a considerable body of first-class silver-lead ore. The vein strikes east and west and has been opened up by a series of open cross-cuts over a distance of six thousand feet. It is understood that the new company will proceed with development on a large scale.

Extensive development work is planned on the Whitewater and Comstock groups of mineral claims on Cascade Creek in the Lardo District, and on the Nonpariel Group at Zincton. These properties belong to the Nelson Mining and Development Company, Spokane. W. W. Shaffner, general manager, has returned to Nelson, after a trip of inspection on which he was accompanied by Clarence Marsh, secretary-treasurer of the company, W. Euler of Soap Lake, Washington, and A. L. Maltbie, of Wenatchee.

They put some men to work continuing No. 2 tunnel at the Cascade Creek Mine. This tunnel has already been driven 120 feet and it is estimated that another seventy or eighty feet will strike the main ore body. The ore is silver, lead and gold. The nonpareil group is in the immediate vicinity of the Lucky Jim Mine, and is considered to be a prospect of much promise.

The Mansfield Mining Company is developing what is known as the Crescent group of mineral claims situated in the Alpine Bas near Trout Lake. The main vein was first tested by a shaft which showed up so well that it was decided to drive a tunnel to strike the ore at a considerable depth. This tunnel has been driven some 185 feet with satisfactory results. The company proposes driving a second tunnel for a depth of 450 feet on the ore body. The ore is silver-lead, running thirty to fifty ounces of silver and seventy per-cent lead. When development has advanced sufficiently it is the intention to erect a Gibson concentrator. Another promising property of the Trout Lake district is the Tribune Mine, which carries high values in silver. Development of the new body of ore which was worked to some extent last season will be continued this summer. The Crown property which is located above Trout Lake has been bonded by California mining men who are said to propose the erection of a mill this year.

Mining development is progressing energetically in the Salmon River Valley, Portland Canal District. At the well-known Premier mine an assay office is being built and accommodation provided for a considerable force of miners. A portable saw-mill already has started work and a road gang is engaged in putting the road in shape for heavy hauling. Similar operations are under way on the property of the Bush Mines, Ltd.

"Sirocco"

TRADE MARK

VENTILATION— Does It Pay?

In order to maintain the maximum production, with a corresponding high standard in the quality of the work, it is absolutely necessary that every working place should have a good working atmosphere, and that the ventilation should be so kept up with the progress of the work that the men may continue to perform their duties in health and comfort. Mechanical ventilating systems which have been designed with careful study and are now in operation have fully justified the cost of their installation, as evidenced by the increase in tons per man per shift and the decrease in cost. In mines where such a system has been carefully worked out and conditions have been standardized as much as possible, there has always been a great saving in the amount of compressed air used. In fact, in some cases the economy in this item alone has more than balanced the cost of installation.

The accompanying extract and chart are from **"Standardization of Mining Methods"** by Charles A. Mitke, Engineering and Mining Journal, Nov. 30, 1918, and answer most conclusively the question, does it pay?

He says, among other things, **"in some cases the economy in this item alone, (compressed air saving)** has more than balanced the cost of installation."

His charts of actual performances where mechanical ventilation has been installed show that after installation the output per man per shift was more than doubled; and the cost was cut to LESS THAN HALF.

Compressed air savings more than balance the cost of installation; your output is doubled; your costs cut in half. All these indicate there is something worth while investigating. SIROCCO fans are extra efficient in forcing large volumes of air through the tortuous and restricted passage-ways of the average mine.

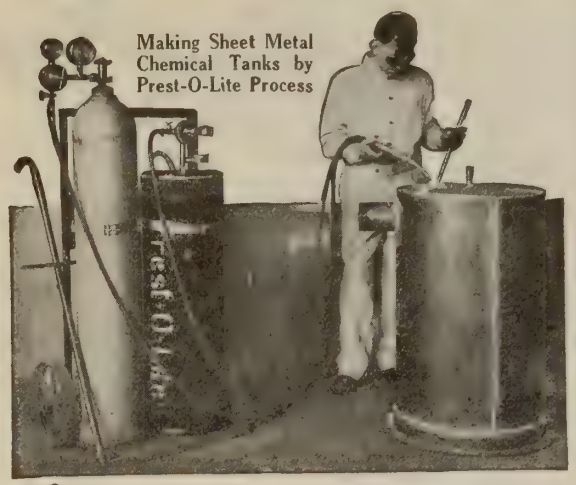
Oxy-Acetylene Welding and Cutting



Making Sheet Metal Chemical Tanks by Prest-O-Lite Process

"Rivetless" Metal Joining Makes Tanks Leak-Proof

Here is shown how permanently leak-proof sheet metal tanks are made by the Prest-O-Lite Process. The metal sheets are first cut to shape with a Prest-O-Lite cutting blow-pipe. They are then set in position, and all joints are welded by the Prest-O-Lite Process of oxy-acetylene welding. The joints are made stronger, neater, and at less cost than by riveting. All danger of leakage at joints is eliminated.

In repairing as well as in manufacturing the Prest-O-Lite Process is literally "blazing the trail" to efficiency and economy. It saves hundreds of thousands of dollars annually in Canadian factories, mines, machine shops—wherever metal or machinery is used.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite service, which insures prompt exchange of full cylinders for empty ones. Provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow-pipe, automatic regulators and gauges, and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow-pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of sayings made by others. It may suggest valuable ideas to you. Write for it.

BOWENA COPPER MINES, LTD.

The Bowena Copper Co. holds under license 3 claims of 150 acres each on the east side of Bowen island, 12 miles west of Vancouver. Development consists of 300 ft. of tunnelling, 50 ft. shaft work, and numerous open cuts. The ore contains about 2 per cent. copper and small values in gold and silver. A concentrating mill is practically completed and ready for milling operations.

The Bowena Copper Mines, Bowen Island, B.C.

The company is capitalized at $300,000 in $1 shares. There is outstanding 27,0820 shares. There has been expended on development and equipment $30,000.

The officers are: L. A. Brown, president; T. W. Turner, vice-president, and C. M. Oliver, secretary-treasurer.

The annual meeting was held in March, 1919. Alex. Sharp reports ten to twelve thousand tons ore blocked out, containing about 1.8 per cent. copper

---

Corundum, Limited, a newly incorporated company, capitalized at $250,000, was recently organized by E. B. Clark, formerly manager for the Manufacturers' Corundum Co., at Craigmont, Ont., from 1907 to 1918, for the concentrating of corundum ores. Control of the properties of The Manufacturers Corundum Co. was secured and a concentrating mill of at least 100 tons per day capacity is now being constructed at Craigmont, Ontario. Large burning engines are being installed and the mill will be equipped and 16 Wilfleys, classifiers, Hardinge ball mill and other modern machinery. Mr. W. W. Hudson, re-recently with The General Engineering Co. of Salt Lake City, is engineer in charge of construction. G. H. Ferguson, of Renfrew, is President of the new company, and E. B. Clark, of Craigmont, is Vice-President and Managing Director.

POSITION WANTED—Mining Engineer, 15 years' experience all kinds metal mines, 12 years Superintendent, Manager and Examination. College Graduate. Member C. M. I. Apply A, Canadian Mining Journal.

:-: EDITORIAL :-:

THE VINDICATION OF SELF-CONTAINED BREATHING-APPARATUS BY USE UNDER WAR CONDITIONS.

There has been a significant coincidence in the attention given at practically all annual meetings of mining societies held since the conclusion of fighting on the western front to the part played by tunnelling corps in sapping and mining operations, and the papers and discussions at these meetings, both on this side of the Atlantic and in Britain, have disclosed the great extent to which use was made of self-contained breathing-apparatus, chiefly of the oxygen cylinder type, and the reliability shown by these devices under the strenuous conditions of war service.

We reproduce in this issue a paper read before a recent meeting of the Western Branch of the Canadian Mining Institute, which deals largely with the standard-type "Gibbs" apparatus which has been developed under the supervision of the United States Bureau of Mines. It is interesting to know that a composite apparatus of similar excellence is a likelihood of the near future in Great Britain.

Speaking to a discussion on Colonel Dale Logan's paper on "The difficulties and dangers of mine-rescue work on the Western Front, and mining operations carried out by men wearing rescue-apparatus" at the Annual Meeting of the Institution of Mining Engineers in London, Sir W. E. Garforth referred to experimental work which had been carried on in England, and forecasted that in another twelve months, with the help of the Home Office Committe, which he believed was quietly doing valuable work, he thought we should have the apparatus which many had been looking forward to for the last thirty or forty years.

On a number of occasions the "Journal" has advocated that some central governmental authority should undertake to do what is now apparently near completion, namely to devise a breathing-apparatus which should avoid the disclosed dangers of the existing types, and should combine the admitted excellences of these types. The British Home Office, when it enforced the compulsory provision of rescue-apparatus at collieries, became morally responsible for the provision of an approved type of apparatus, and we presume that, but for the interruption of the war, some effort of this kind would have been undertaken ere now. When the war had commenced it speedily became aparent that oxygen breathing aparatus would be used on a scale and under conditions of test that would yield far more important experimental results than could be obtained in many generations of peace-time research, and it would appear as if those who had anticipated interesting and valuable disclosures regarding the war-time evolation of self-contained breathing-apparatus are not to be disappointed.

One other important result of the work of the tunnelling corps is the number of trained and resourceful wearers of breathing-apparatus that will return to employment in mining.

One opinion of Colonel Logan will be agreed in by all who have in any way to do with mine rescue-work. This gallant officer said: "We never found a man refuse to go down, but some of the men were quite incapable of carrying on the work of rescue. The ruthless exclusion of men physically or temperamently unfitted for the work was necessary." The specialised nature of mine rescue-work, and the unsuitability of untrained men, combined with a proper sense of the limitations of breathing aparatus, are first considerations, and in their neglect is to be found the foundation of most of the bad things that have been said about the use of these devices.

PRESIDENTIAL ADDRESS, INSTITUTION OF MINING & METALLURGY.

We reproduce in this issue the full text of an address given before the Institution of Mining & Metallurgy in London by Hugh K. Picard. The comprehensive survey of recent metallurgical progress which provides the subject of Mr. Picard's remarks shows how extensive and specialised a science the recovery and refining of metals has become. Mr. Picard's address touches chiefly on the metallurgy of zinc, lead, silver, copper and gold. The references to the metallurgy of iron and steel are few, notwithstanding the great financial importance of this industry and the prominent part it plays in the literature of technical societies, and we believe the wide range of metallurgical subjects reviewed, with scarcely a mention of the technique of underground mining operations, is a fair indication of the importance of modern metallurgy, and of the wisdom of recognizing the fact by including metallurgists by name in the titles of mining societies. The average mining engineer canot hope to become a metallurgical specialist, nor is it required of a metallurgist that he should acquire all the mysteries of the miner's art as practised underground.

We believe the change of the name of the American Institute of Mining & Metallurgy was an overdue recognition of the growing importance of the metallurgist, and, if the Canadian Mining Institute should decide to also change its name so as to more adequately expres

the composition of its membership, the decision of the members will be as time goes on recognized as a just and proper one.

CORRESPONDENCE.

Kirkland Lake, Ont.
July 14, 1919.

The Editor,
The "Northern Miner."
Dear Sir,—

A lengthy and entirely misleading statement has recently appeared in the press purporting to put forward the miner's side of the Kirkland Lake strike, and as the actual facts have never been published, I am directed to lay these before you and correct some of the erroneous statements referred to in the public interest. Many hard working and contented men earning good wages have been victimized by the tyrrany of the local union and are suffering in common with the whole mining industry on this new and promising gold field; it is no doubt in an endeavour to placate these victims who are showing signs of active opposition to the extreme agitators who engineered this ill-starred strike.

The statement referred to says in effect:—

(1) That the state of unrest was caused by the increased cost of living—the fact is that the vast majority of the men were boarded and housed for $1.00 per day by the Companies regardless of the cost of commodities; and Union officials specifically stated that "Recognition of the Union" was the real bone of contention. Wages, so far as remaining stationary as alleged, showed a continuous rising tendency.

(2) That the District Union endorsed the wage scale demanded by the Local Union. Did the District Union, however, endorse the demand for Saturday afternoon holidays with full pay; the discharge of all non-union men; $135.00 a month and room and board for cooks; and the other demands of which no mention is made?

(3) That the recent meeting was unanimous to go back to work—(if and when it can be provided, it should have added)—pending the award of a Board of Conciliation, and expressed its willingness to abide by the decision of the Board—This meeting was a frame-up as the result of a meeting held just beforehand in the Union Hall. The proviso is carefully suppressed, "That the decision of such a Board must however be unanimous," or in other words in agreement with the Union nominee on the Board; in fact a pure farce.

(4) That the men are taking a firm stand not to accept anything but the wages demanded by them—If this is true it is no wonder that they made the proviso (suppressed), in the previous paragraph, but the fact is that numbers of men would gladly go back to work if there was any going; meanwhile many are working on the road at much less than they earned at the mines.

(5) That the men are always willing to negotiate—their whole statement shows that the Mine Managers have always been perfectly willing to negotiate too with their own men collectively. The manager will not, however, negotiate with a Union which is definitely proved to have Bolshevik influence back of it.

(6) That any mines working are doing so with the full sanction of the Union—this is wholly untrue, and we defy the Union to name any such mine in Kirkland Lake.

The simple facts are that this strike has been brought about by a number of men, many of whom are notorious agitators and draft-evaders, by the preaching of rank treason, rebellion, revolution, and sedition and terrorism of the most pernicious kind, which prevents men who want to earn decent livings from doing so. Some samples of the printed literature posted up in a mine building will give some idea though a very slender one, of what kind of poison has been at work—"The New Morality" says, "Damn interest, Damn rent, Damn profits, Damn agreements.

"We've damned well enough to do to look after ourselves and families.

"The power must be taken out of the policeman's club.

"How? Anyhow.

"Why? Because it hurts our class and is therefore immoral.

"The guns mustn't point our way if they aren't spiked, because they are liable to go off and hurt us, and that would be immoral. So we must spike the guns or turn them around.

"Strike when the boss has a big order which he must fulfil. It will hurt him more and us less, and that is moral. Tie up the industries in town, all the industries in all the towns, in the whole country, or in the whole world if necessary."

Bolshevik influence is at the head of the local Union, and we defy the Union to deny it. that is a deliberate statement and we hold the proof. It has proved that it is uncontrolled by the Headquarters of the Union by its action in calling this admittedly illegal strike which has entailed heavy loss on the whole community, and the mines will certainly not attempt to restart operations until the issue has been disposed of as to whether Bolshevism or decently organized and controlled labor is to hold sway in the field.

Yours truly,
KIRKLAND LAKE MINE MANAGERS ASSOCIATION.
J. E. Grant, Secretary.

HIS MAJESTY THE MINER.

How is his majesty, the coal miner, this morning? Most fervently do we hope that he slept well and awakened kindly disposed towards his humble subjects, the people of the Commonwealth. To him we make obeisance, and express the hope that he spent an enjoyable week-end — that he had a good day at the races, that he was lucky at his fishing, his cards, and his love-making; that his vegetable garden flourished, that his fowls laid many eggs, and that the beer was good; in short, that he rejoiced in whatever he did. His majesty, the coal miner, has made his periodical toll upon his subjects, and we loyally, and resignedly, proceed to pay it at the behest of the Government through which his majesty rules the people. We, therefore, trust that his majesty is now in a contented frame of mind, that he shows no signs of unrest, lest he should make a further toll upon his subjects. His well-being is of so much importance that everything we can do to promote it will be done right willingly.—The "Australasian" by way of Rossland "Saturday Night Miner."

Development and Improvement of Breathing Apparatus

By H. H. SANDERSON.

(Read before Western Branch, C. M. Inst., Nanaimo, June 4th and 5th, 1919.)*

Self-contained breathing-apparatus, more often called, "rescue-apparatus," is designed for the purpose of saving live and property when endangered by fire, smoke, fire damp or other poisonous gases, either above or below ground. The portable apparatus is one which enables the wearer to penetrate the irrespirable gases without being supplied with air from any outside source. It is therefore essential that such apparatus should provide the wearer in these circumstances, with good air, by continuously rendering the exhaled air fit for reinhalation, that is to say, it must be provided with means for renewing the consumed oxygen in a continuous manner and in sufficient amount, besides making harmless the carbon-dioxide produced in the lungs. At the same time the apparatus must not form a hindrance in the performance of work.

Breathing-apparatus of the self-contained type was first introduced into the United States in 1907, following which the Proto, Draeger and Westfalia apparatus were installed at various mines and plants throughout the United States and Canada. The Proto apparatus was manufactured in England, while the latter types came from Germany. Little change has been made in the Proto apparatus up to the present time, although several more or less important improvements have been made on the Draeger. The Westfalia did not meet with great success, and the sale of this type was soon abandoned.

Importation of these types of apparatus continued until 1914, when it became necessary for the American representatives to manufacture for themselves. Considerable difficulty was experienced in this work for some time. Investigations conducted by the United States Bureau of Mines demonstrated very forcibly that there was considerable room for improvement in the various types of European made apparatus, and the work was commenced by the various engineers, physiologists and chemists of the Bureau of Mines for the development of an improved type of oxygen breathing-apparatus which will be referred to later in this paper.

Before taking up the question of improvements on the various types of apparatus let us look for a few minutes at the principal defects in the three types previously mentioned. In January, 1917, the United States Bureau of Mines published Technical Paper No. 82, written by Yandell Henderson and James W. Paul. The purpose of this publication, or report, was to supply information regarding the relative merits and defects of the various types of apparatus then in use. With this in mind I trust that I may be pardoned if I quote from this report, for I feel that after the thorough investigation which these men made, no one is better qualified to present this matter to the public, and so in pointing out the limitations of the apparatus in use in 1917, I will use their report.

*Reprinted from the Canadian Mining Institute Bulletin for July, 1919.

In developing self-contained breathing-apparatus the real problem is not only to make an efficient and reliable device, but also to fit it to the peculiar and varying needs of the wearer. It is important if a man is to wear breathing-apparatus for even a few minutes, and essential if he is to depend on it to keep him alive for several hours, and do also considerable work, that the condition in his lungs should be essentially similar to those when breathing normal air. The apparatus must adjust itself to the respiratory needs of the wearer, and also to wide variations in these needs. Until recently, however, the wearer has been expected to adjust his breathing to the apparatus. To forget, or fail to do this even for a few minutes, might cause his death.

One of the principal defects of former types of rescue apparatus as usually arranged, was that the oxygen supply was set at a fixed amount per minute, and that this amount, although more than sufficient to cover the requirements of the wearer while resting, was quite insufficient to allow him to make vigorous physical exertion.

Oxygen is often spoken of as a food. In one sense this is correct, but the demand for oxygen differs from the demand for food in the fact that the supply of oxygen must be continuous. A man may go without eating for several days, and still be able to do considerable work. After being properly fed he may be none the worse for his experience. Conditions as regards the oxygen supply are far more peremptory. The amount that the body uses in any one minute it needs and must have within that minute, or at least during the next succeeding minute. Even a slight deficiency in oxygen impairs intelligence and judgment, and produces almost immediately a condition of intoxication or delirium, rendering the subject incapable of intelligent action and paralyzing the muscles so that he cannot stand or walk. If this deficiency is continued for even a few minutes serious and often permanent injury to the nervous system (or even death) results. These considerations have not heretofore been adequately taken into account.

This insidious effect of breathing air deficient in oxygen cannot be over-emphasized. The symptoms are in practically all respects identical to those of breathing carbon-monoxide, and in some respects resemble those of alcoholic intoxication. The peculiar danger in breathing such air lies in the fact that discretion and judgment are quickly impaired. Moreover, in many individuals, perhaps in most men, the breathing is at first so little affected that the man remains unwarned of his danger until his legs give way and he falls helpless.

Secondly in importance to a sufficient supply of oxygen is an efficient arrangement for absorbing from the air in the apparatus the carbon-dioxide that the wearer produces. One of the most important facts demonstrated by recent advances in physiology is that in normal men and animals, under ordinary conditions, the amount of breathing is principally regulated, not

by the oxygen consumption, but by the carbon-dioxide produced. For this reason it appears improbable that any apparatus for use in poisonous gases can ever be devised for use for more than a few minutes at a time with which the wearer will not do any rebreathing whatever. It is especially important, therefore, that the alkali should be so arranged as to absorb as completely as possible the carbon dioxide-exhaled by the subject into the bags before he again inspires the air.

In the former types of Draeger and in the Westfalia apparatus the expired air was drawn through the absorber and into the inspiratory bag by means of an injector through which the oxygen enters the circulation system. Natural circulation, that is, movement of air produced by the subject's breathing, as in the Fluess-Proto apparatus—is to be preferred to automatic circulation induced by an injector. One particular advantage of natural circulation is that if the wearer happens to become imprisoned in "bad air" he can make his oxygen supply last for many hours by turning off the fixed feed on the oxygen cylinder and using the by-pass at intervals to supply the relatively small oxygen consumption during rest hours. Otherwise the supply would run out at the end of two hours, and the man might lose his life. With apparatus of the automatic circulation type, such conservation of oxygen is impossible, for turning off the oxygen feed stops the absorption of carbon dioxide and makes the breathing much harder.

No subject in regard to rescue apparatus has been more debated than the use of the helmet. Many practical mining men insist that the helmet is advantageous in that it allows the wearer to speak more distinctly and to breathe through the nose, a more natural method of breathing than with the mouthpiece and nose clip. It necessitates the wearer's breathing into a "dead space" greater than the volume of an ordinary deep breath. The air that the wearer expires into this space he is obliged, in good part, to reinspire from it. The defects of the helmet are serious, but the greatest objection to its use is the danger of leakage. I am glad to say at this point that the officials of the British Columbia Government, realizing the inefficiency of the helmet, were among the first to install the mouth-breathing apparatus.

The importance of having all valves, tubing, and openings as large and as free from resistance as possible has not, until recently, been adequately appreciated either by the manufacturers or users of breathing apparatus. When one puts on any of the three types of apparatus previously mentioned, he finds that he can breathe quietly back and forth into the bags without noticable effort. Even if directed to breathe vigorously for a few seconds, most subjects declare that they feel no considerable resistance. If, however, the wearer is required to exert himself so vigorously as to induce heavy breathing, he finds a resistance so exceedingly annoying that it soon occupies his mind to the exclusion of everything else, and he is strongly tempted to tear off the apparatus.

Safety demands that when the water of an apparatus is surrounded by an atmosphere containing poisonous gasses there should be no leakage inward. With the injector type of apparatus it is particularly important that no negative pressure should occur at any point where the outside atmosphere may be drawn in. As formerly constructed the injector of the Draeger drew air through the absorber. In case the absorber or the tube leading to it was cracked, poisonous gasses could enter. A life has been lost in this way. This defect has been to a considerable extent remedied by so placing the injector of the Draeger apparatus that the air is forced through the absorber under a slight positive pressure. In any arrangement of this sort, however, there must always be a greater or less area of negative pressure on the side from which the injector draws. This is an additional reason for abolishing the artificial circulation and giving up the injector entirely. A natural circulation depending upon the respiratory movements of the wearer is altogether preferable.

It is an advantage to have a slight positive pressure in the apparatus, although it must of course not be of such amount as to impede the wearer's expiration — above 0.5 centimeter, or at most 1.0 centimeter, water gage. Even the best constructed apparatus is liable to leak slightly, and all leaks should be outward instead of inward. One of the principal reasons for recommending a greater supply of oxygen in the apparatus of the fixed-feed type is the fact that there will then be a continual slight leakage outward of the excess. On the other hand, when the supply is insufficient, and the breathing bags are sucked flat at each breath, the negative pressure so produced may draw in the surrounding poisonous atmosphere.

As regards joints and connections of these three types of apparatus, the Fluess excels both the Draeger and Westfalia. The many joints on the Draeger apparatus require careful inspection to insure their being made fast. Screws having a cross arm for turning admit of making the joint reasonably tight, but thumbscrews with a circular milled head are not so reliable, as a heavy glancing blow will often loosen them. Such screws have frequently been found loose both in training and in actual rescue work. In many instances loosening has been due to the metal part of the tube not having a locked seat so that a slight movement of the metal part has worked the screw loose.

The reducing valves of the former types of apparatus also were frequently a cause of trouble, as a result often of the deterioration of the rubber diaphragm. One of the most serious difficulties in the way of devising and constructing a reliable mine rescue apparatus is the necessity of using rubber. So called pure gum rubber remains soft and elastic in Europe for months, but in the dry and brilliant climate in which most of the American mines are located it becomes stiff and brittle in as many weeks. It appears at present impossible to avoid entirely the use of rubber, but it is evident that the parts composed of rubber should be as few as possible.

Impelled largely by the observations made by Doctors Henderson and Paul, the Bureau of Mines undertook to develop a breathing apparatus that should embody the recommendations of these men, and consequently in 1914 W. E. Gibbs, a mechanical engineer of experience and skill especially suited to the task, started, with their assistance, to design what is now known as the Gibbs apparatus.

Two years later, during a period while Mr. Paul was not connected with the Bureau of Mines, and while he was affiliated with Mr. Clarence Hall, who had previously left the Bureau of Mines service, Mr. Paul took out the patents on the details of construction of an oxygen breathing-apparatus which is now known as the Paul Apparatus.

Both the Gibbs and Paul apparatus have now been perfected, and placed on the market. The machines

show considerable improvement over the former types. In the first place the former type of fixed-flow reducing-valve has been replaced by a feed which delivers the oxygen to the wearer as it is required. The efficiency of the regenerating cartridge has been greatly increased, and the circulation throughout the apparatus is maintained at a practically normal rate.

The use of the helmet has been discontinued in favor of the mouthpiece, which is a decided improvement over former types of mouthpieces in that the breathing is much easier and the saliva is readily disposed of.

The danger of negative pressure has been eliminated and the outlet openings on the reducing valve of the Gibbs apparatus have been considerably enlarged. There are no rubber parts in or around the valve to deteriorate. The number of working parts and connections have been reduced to a minimum, and the use of rubber has been cut to the very smallest possible amount. Simplicity means safety. The weight on the Gibbs apparatus has also been reduced to 35 pounds.

Through an act of Congress, approved February 25th, 1918, the Bureau of Mines set about to establish a schedule for the official test and approval of breathing-apparatus. This schedule, known as No. 13, was first published in March of this year, and the Bureau is now engaged, at their testing station in Pittsburgh, in testing apparatus for approval. According to this schedule, No. 13, all breathing-apparatus which passes their test and requirements will carry an approval plate marked as follows:—

"Permissable Mine Rescue Breathing Apparatus U. S. Bureau of Mines. Approval No. ——"

In conclusion, let me say that never in the history of breathing apparatus in this country have there been such marked improvements as in the last 18 months. This has been brought about principally by the work of the Bureau of Mines and also by the urgent call received from General Pershing for 500 sets of Gibbs Apparatus for service in France, the Gibbs having already been perfected by the Bureau.

It is hoped that the possibility of having approved apparatus on the market in the near future will do much to increase the confidence of mining men in the use of such equipment, and also to stimulate interest in the training of men to wear the apparatus when the occasion demands.

CASSEL CYANIDE TO INCORPORATE CANADIAN COMPANY.

J. A. McRAE.

Official information has just been received that the Cassel Cyanide Company, Ltd., of Glasgow, Scotland, has, on the recommendation of Mr. Neill, managing-director, decided to incorporate a subsidiary company in Ontario to be called "The Cassel Cyanide Company of Canada, Limited." Mr. Neill has just reached Scotland after having completed one of his periodical tours of Canada and Mexico and was so favorably impressed with the splendid mineral resources of Northern Ontario as well as with the opportunity that exists for industrial development throughout the Dominion, that he most strongly recommended his co-directors to give this country an especial amount of their business attention.

The object of incorporating a subsidiary Company in Canada is primarily to bring the parent organization into more direct touch with the requirements of Canadian mining interests, but the further outlook is along the lines of general metallurgical and allied industrial development. Three members of the Glasgow board will be on the directorate of the Canadian company. All are highly successful business men, each being a specialist in the section of the organization to which he has given a life-long study.

Mr. William Neill, the managing director of the Glasgow company, will discharge similar duties in Canada and will be more frequently on this side of the Atlantic than formerly. He has been associated with cyaniding since Mr. John S. McArthur, the original managing director of the Cassel Company invented and developed the cyanide process which has been of such inestimable benefit to the gold and silver mining industry.

Sir George Beilby is the inventor of the process for manufacturing cyanide which the Cassel Company adopted over twenty-seven years ago. During the war he patriotically devoted much of his energy toward developing methods of extracting oil from coal, so as to render the British navy less dependent on foreign countries for the fuelling of oil-burning high-speed naval vessels. In recognition of his many discoveries and of his scientific attainments he received, two years ago, the honor of knighthood. Sir George has devoted much of his spare time to the study of radium, especially in its metallurgical extraction and in its application to the treatment of diseases. He is president of the British Radium Institute.

Sir Edward Allen Brotherton, another director, is a chemical manufacturer and the private owner of many large acid plants in various parts of England. His specialty lies along the lines of saving waste by-products and turning them to profitable account. He has several times been Lord Mayor of Leeds, and, at the commencement of the war, raised and equipped the regiment of which he is honorary Colonel. He was created a baronet slightly more than six months ago.

One unique feature in the operating of the parent company as regards gold and silver mining has been the acquiring of interests in properties of potential merit and of helping mines which may be unable to reach the profit-earning basis for no other reason than that of lacking a treatment plant. Mr. W. E. Simpson, who joined the original Cassel Company nearly twenty-four years ago, has, during the past seven years, attended to this part of the company's affairs from the practical standpoint and has spent much of his time in examining properties and, where need be, of installing the necessary plants.

Canada welcomes the arrival of the organization and, for many reasons, especially in the interests of its own development, heartily wishes the Cassel Cyanide Company of Canada, Limited, every success. The service rendered in the time of war has not been forgotten—that service wherein the mines of Canada were supplied with cyanide requirements at a price lower than the average in any other of the British Dominions.

PERSONALS.

R. B. Watson, general manager of the Nipissing mine, left Tuesday evening on a trip to various points in the United States.

W. E. Simpson is now en route to Glasgow, on board ss. "Cassandra." Mr. Simpson expects to return to Canada later in the summer.

Homer L. Gibson, broker, of Toronto, is in the Porcupine district this week in connection with the development of the Clifton-Porcupine mine.

Presidential Address by Hugh K. Picard

INSTITUTION OF MINING AND METALLURGY, LONDON.

Introduction. In addressing you to-night I propose to follow the course taken by my predecessors in giving a brief survey of recent metallurgical progress, in so far as such has come within the purview of my particular character on matters affecting our industry. In normal times it would be a simpler task to follow and record such developments, but the War has imposed entirely new conditions which increase the difficulty of a review, such as secrecy (in order to prevent leakage of information to the Enemy), urgency (wherein economics have been thrown to the winds in the materialization of a desired military result), an entire re-grouping of the factors of chemical and metallurgical supply and demand, and, finally, the promise of revolutionary changes in regard to labor.

As to the first of these it is to be hoped that, as the necessity for secrecy no longer exists, many of the great advances in technical and metallurgical science evolved under the stimulus of war may now become known for the early benefit of our national industries.

Further, it is much to be desired that such industries as have sprung up in response to our urgent necessities (other than those concerned with the production of purely war material) will not only be retained by us, but will continue to develop to the advantage of the country and the nation. Certain of these have been re-created in an artificial atmosphere of State support or subsidy; several, with such assistance, having reached a stage of technical efficiency, it appears to be of vital importance that further encouragement should be afforded them for such periods as will secure their permanence or of their requiring a minimum of external support.

Tungsten. A typical example of this is the tungsten industry, about which so much has been made public. Even the non-technical reader is now familiar with the general facts regarding this metal, while a certain amount of information as to its production has also become known through the technical press. It will be sufficient for me to refer to Julius L. F. Vogel and A. F. MacLaren, whose able work resulted in the production of this essential metal—essential not only in war, when its supply was a vital necessity to the country, but also in time of peace. Its importance is well expressed by the American metallurgist, Colin Fink, who says: "It may some day be said that tungsten made democracy possible." Through the efforts of these metallurgists and their associates we are now independent of foreign supplies and, moreover, the quality of the British production is superior to that previously imported from Germany.

Flotation. In regard to recent metallurgical advance during the past few years it will probably be conceded that the practice of flotation has brought about greater progress in metallurgy than any other single invention. At the inception of the froth-flotation process in 1905, oils, such as oleic acid (then deemed to be insoluble), were used. As careful analysis showed the mineral so frothed to be intimately associated with the insoluble oil employed, the impression was gained that this had uniformly coated the particles which had been floated, and that the air bubbles had become attached to such oiled particles. As the amount of oils used was relatively minute, say 2 lb. to the ton of ore, while the aggregate surface of the particles oiled is enormous, calculation showed it to be questionable whether an oil could be distributed qua 'oil' in such extreme tenuity and still retain its original physical properties.

With the discovery, some four years later, that other and wholly-soluble frothing-agents were found equally and sometimes even more effacious, the conception that oil was primarily essential to frothing was necessarily modified, and the process became more widely known as that of 'froth-flotation.' With later discoveries as to the partial solubility of essential oils, of the beneficial effect of certain insoluble oils in 'stabilizing' the froths and of sub-aeration procedure, the elimination of any need for pulp-heating, or in many cases for acidification, together with the use of alkaline circuits, etc., modern flotation has made remarkable advances.

Broadly speaking, the essential conditions for effective flotation appear to be that the material to be floated must be capable of flocculation, while that not to be floated must be brought as nearly as possible to the reverse state. This is achieved by the addition to the ore-pulp of reagents which by adsorption or sorption at the surfaces of the various particles increase such differentiation. Acids, alkalis, and certain alkaline salts act in the direction of wetting the gangue by water more profoundly, producing a deflocculation effect, whereas the adsorption or sorption of a minute amount of an immiscible oil at the mineral surface renders this still less capable of being wetted by water, and thus stabilizes a mineral-coated bubble in water

The water-soluble portion of an oil, or a water-soluble substance such as cresol, amyl-alcohol, etc., reduces the tension of water, and thus permits the latter to form an extended froth surface for occupation by the less water-wetted floatable mineral. Certain oils may thus pay a dual part in flotation. Variations in ore constitution — both physical and chemical in the nature of the water, in choice or limitation of reagent, and in local conditions generally—are so wide that each one will present a flotation of its own, requiring individual study. Where the factors are so varied flotation must in large degree remain an art, as well as a growing science. This condition, however, governs applied science generally, and metallurgical processes form no exception to the rule.

I understand that contributions to the more scientific aspects of flotation may be expected shortly, which will, no doubt, go far to elucidate the fundamental principles on which the process is based.

Since the outbreak of war flotation methods have been widely, indeed almost universally, adopted. During this period, the greatly extended use of this process in the United States is the most notable feature, and it is hardly too much to say that concentration practice has been revolutionized: in addition to the increased recoveries of mineral due to the ability of this method to deal effectively with slime, its adoption has led to a general simplication of concentration procedure, with a corresponding reduction of working cost.

In modern installations, such as that of the Inspiration Consolidated Copper Co., at Miami, Arizona, where the plant was specially designed for flotation, the current practice is to limit the units to the smallest number possible. At this mill the ore, first crushed by disc-crushers, is passed to tube-mills, working in closed circuits; the pulp is then immediately sent to flotation units with the consequent elimination of all intermediary steps in the concentration. The re-treatment of any middling products and the enrichment of the primary concentrates is also effected by flotation, resulting in a simple flow-sheet.

Froth-flotation has developed the use of settlers and vacuum-filters, which are now indispensable units in concentration plants adopting this process. The settlers are in some instances employed for the re-utilization of plant-water, and in others for the thickening of concentrate prior to vacuum-filtration; their usual size is from 30 to 50 ft. in diameter, but in some instances settlers of over 200 ft. in diameter are in use. The shallow 'tray' settler is also employed where the physical character of the ore permits; these consist of units 3 to 4 ft. in depth superimposed on a common shaft to economize space and secure increased capacity.

Similar progress has marked the evolution of the flotation-units themselves. In the Mineral Separation type, for example, the driving gears have in some instances run continuously for over three years. These units are self-regulating, the supply of reagents being automatic, so that in practice it is not uncommon to find one man per shift operating units dealing with between 3000 and 4000 tons of ore per 24 hours.

Everywhere the tendency is toward the elimination of hand-labor; thus, besides ore, the concentrate and tailing are handled by settlers and belt-conveyors, whereas the grouping of all units is designed with the object of reducing labor, space, and construction cost to a minimum. The result has been a reduction in cost which, in many instances, has rendered obsolete the best of the older gravity concentration systems.

Some comparative figures as to the advantages of flotation may be of interest. The total tonnage of ore treated by water concentration at the Anaconda plant from February 1902, to December 1915, was approximately 36,000,000 tons, carrying 1,250,000 tons of copper, of which the actual recovery was approximately 900,000 tons. In 1916, flotation was installed, from the results of which it is estimated that had it been used during the earlier period 175,000 additional tons of copper would have been saved, capable of realizing, less cost of treatment, a further profit of nearly £8,000,000. In 1913, when water or gravity concentration had attained perhaps its high-water mark of efficiency, the five largest disseminated copper mines in the United States produced approximately 162,000 tons of copper, but discarded about 83,000 tons in tailing, the average recovery of copper at these mines being about 66%; had flotation been employed it is now demonstrable that their increased recovery for that year alone would have exceeded £3,500,000. In its turn, however, flotation has introduced new smelting problems, mainly due to the fineness of the material to be handled; the International smelter, at Miami, which now represents the latest copper-smelting practice in America, has been specially designed to deal with this type of concentrate. Hand-labor here has also been practically superseded by mechanical appliances; specially designed cars handle the concentrate and facilitate loading and unloading, prior to its passage to the roasting-plant. The roasters are fired either by oil, or coal-dust, the latter having now proved the more economical; the Cottrell process here becomes a necessary adjunct, preventing dust losses with practical completeness. Again, progress in one department of metallurgy has imposed conditions which have led to improvement in another, thus the cost of smelting the fine concentrate, originally so difficult to handle, is now reduced to between 5 and 6 shillings [1.25 to $1.50] per ton of charge.

Though the theoretical principles underlying flotation are still unsolved, progress in this direction is being made and it is one of the most remarkable features of this process that its use has been so greatly extended while its full scientific basis is yet unestablished. Callow, whose contribution to the technique of the art deserves special mention, calculates that with four different oils, three oil-percentages, two pulp-densities, and two changes of temperature, the possible communtations are no less than 59,284. This gives some idea of the difficulty experienced in arriving at the effect of any given change of conditions, but in spite of this over 400 flotation plants have been installed on the North American continent alone.

Zinc. Passing to the metallurgy there has not been any marked improvement of first importance in smelting during recent years, though general advance in matters of detail may be recorded. The problem of the mechanical roasting of the ores cannot yet be considered as completely solved, especially for the more refractory type, such as Broken Hill concentrate, which forms so large a proportion of the world's supply of raw material. Though improvement has been effected in this direction, as exemplified by the Ridge and Spirlet furnaces, it is significant that in the latest zinc works to be erected in this country, the management have adopted the hand-rabbled Delplace furnace as being the type best suited to their requirements. These works, situated at Avonmouth, are being constructed by the National Smelting Co., and are designed for an ultimate output of 50,000 tons of zinc per anum. These when completed, with extensions of other existing works, should go far toward establishing the industry in this country on a much sounder basis that existed before the war. No effort is being spared to make the Avonmouth works thoroughly efficient and up-to-date. The general arrangement is well designed, and provision is made for future extensions. The pottery has a capacity of 45,000 retorts, and is arranged for convenient handling in and out; two hydraulic pot-presses are to be installed (one of which is already erected), which will supply the retorts for the 16 retort-furnaces contemplated. These are of modern gas-fired type, the retorts being arranged in four rows back-to-back. The air is pre-heated in regenerative chambers under the furnaces, and are protected from injury due to slag from broken pots by the interposition of a layer of chrome-iron ore between the regenerators and the retort-chamber. Five gas-producers are provided for each pair of furnaces, two being in regular use for each furnace, the fifth being a spare one which can be turned on to either furnace as may be required.

Though Delplace furnaces are being installed for roasting, the management is erecting one of special design, upon the results of which future additions will

depend. The former are of large type, having six muffle-hearths each with 18 sections, and should be capable of dealing with 20 tons of raw concentrate per day. Special care has been taken in the design to ensure easy renewal of the hearth as required.

The acid plant, of platinum "contact" type, was originally built by the Government, and has been used for the manufacture of sulphuric acid from Sicilian sulphur. With the necessary additions for cleaning the roaster gases from arsenic, etc., this plant will be available to deal with the sulphur di-oxide evolved from the 20 roasting-furnaces it is proposed to erect.

In view of the present high cost both of labor and material and the improved extraction now called for, much attention has lately been given to the question of treating retort-residues for their metallic contents, both as to still contained zinc, and other metals such as lead and silver, if present. It has been proposed to blow such residues on Wetherill grates, but this yields a mixed product of zinc oxide and lead sulphate and affords only an incomplete elimination of the silver. Other objections are the inferior quality of the product (due to a certain amount of fine grit being carried over with the fume), while if silver be present the blown fume acquires a pinkish tint, rendering it unsuitable for paint purposes; further, the silver, both in the fume and the ultimate residues is lost. In the absence of silver, a market exists for the zinc oxide-lead sulphate product, if free from grit and carrying about 20% of lead; such a mixture makes a paint of covering power superior to pure zinc-white, besides being cheaper. For ores of a less complex character, 'blowing' the residue offers fair possibilities, and it has even been proposed to modify the usual distilling practice in the direction of only recovering the more easily distilled portion of the zinc, calling for the employment of a smaller amount of reducing coal and leaving a richer zinc-residue for blowing. Such a procedure would increase the capacity of the distilling furnace and result in longer life of retorts, as they would not require to be submitted to the high final temperature necessary to drive off the last units of zinc.

Wet Processes for zinc extraction with the subsequent recovery of the metal by electrolysis have not become firmly established; Ashcroft's pioneer work in this direction will be remembered. The conditions necessary for success, notably roasting at a low temperature to avoid the formation of insoluble ferrite, and the subsequent perfect purification of the solution are now well understood, the latter condition being demanded by the necessity for keeping the deposited zinc in a passive state to prevent re-solution. As a necessary consequence electrolytic zinc will always be highly pure compared even with the re-distilled zinc producible from retorted metal. Much discussion has taken place as to the possibility of the electrolytic process displacing the older method; but it seems probable that for some years to come both processes will survive, and that local conditions with regard to nature of ore, power-cost and facilities, etc., will determine which method shall be adopted for any particular case. It may be said for the electrolytic process that it certainly permits the utilization of low-grade and complex zinc ores which could never be available to the retort process. As an example, the Consolidated Mining & Smelting Co. is treating ores by this method at Trail that assay as low as 20% zinc and carry 14% of lead. Further, combination dry-and-wet processes are likely to develop wherein the zinc oxide (and lead if present) are concentrated as a 'fume' for subsequent treatment by solution of the zinc followed by electrolysis. Such methods have the advantage of yielding a zinc solution requiring the minimum of purification, while leaving other metallic contents in a form recoverable by smelting.

At Anaconda, Laist has proceeded in a reverse direction, by first extracting roasted flotation concentrate with acid, electrolyzing the purified solution, and treating the residue by volatilization in a reverberatory furnace, the contained zinc being recovered as oxide. According to recently published information, Laist no longer recovers the zinc by volatilization, confining this operation to the saving of the lead, while the zinc passes into the slag. How far this is due to more perfect original extraction of the zinc in solution in the previous operation is not stated.

These developments are due in large degree to the work of American metallurgists, who have at their disposal large supplies of ores of varying character offering scope and opportunity for special methods of treatment. But in this country also zinc has been regularly produced by electrolysis from ores, though on a smaller scale; given, however, equal opportunity we may certainly claim to possess the necessary technical knowledge to compete with foreign producers.

The War brought about a large demand not only for the highly-pure electrolytic zinc of 99.95% grade, but also for metal of 99.9% purity obtainable by the redistillation of ordinary brands, and even of 'hard' spelter, which contains about 90-92 zincs, the remainder being mainly iron. The method chiefly adopted in this country was devised by Fricker, who distils the metal in vertical closed crucibles provided with connecting pipes leading into a brick condensing-chamber common to a number of pots, generally eight. The lead and other impurities are prevented from passing over with the zinc-vapor by covering the surface of the molten metal with a floating filter of crushed coke, or similar porous material. By this process large quantities of refined metal have been produced for cartridge-brass and other purposes. How far the demand for high-grade zinc will persist for ordinary commercial uses is uncertain. For most alloys containing a substantial percentage of zinc, as also for galvanizing, ordinary brands of spelter are sufficiently pure; hence consumers are not likely to pay the higher price demanded for 'purity' metal.* The latter will therefore have to compete with G.O.B., and producers may perhaps be forced to accept a price only greater in proportion to the higher unit of the purer product.

Zinc Oxide. Before leaving the subject of zinc metallurgy, reference may be made to the manufacture of zinc oxide in this country. Before the War practically the whole of our requirements were met from Continental and American sources; indeed, our secondary products were in some cases bought by German firms, exported to the Continent for treatment, and the zinc-oxide produce again sold to us. War conditions have since brought about the establishment of a domestic

*The galvanizer would prefer pure zinc if obtainable at a reasonable price, as a more durable product results from its use.

zinc-oxide industry; and, as in other cases, we now produce this material of a quality equal in all respects to that hitherto imported. Works capable of producing 50 tons or more per week are running regularly, and, given reasonable protection against unfair competition, there seems no reason why the whole of our requirements should not henceforward be met from domestic sources.

The oxide is manufactured by distillation of hard spelter, scrap, etc., with subsequent burning of the volatilized metal to oxide, which is collected in bag-house plant in the usual way. Technical details as to pipe arrangements, fan-capacities, etc., have been worked out, and the conditions necessary for the production of the highest quality product have been established. No doubt there will still be competition from American oxide, produced directly from ore, owing to the lower cost of the raw material employed. This oxide, though of inferior color, is suitable for many purposes, such as rubber filling; moreover, it possesses the advantage of high density. Oxide production from ores and residues though not yet established in this country is being investigated, and there is reason to anticipate that this may eventually prove successful.

In South Wales zinc-dust ("zinc blue") has recently been manufactured direct from metallic scrap and a product obtained which is far superior to that derived as a by-product from the retort process; the latter usually contains about 85% of active zinc, whereas the former carries not less than 95%. The demand for high-grade zinc-dust in the dyeing industry is large, and, owing to its superior reducing value, it should have a good outlet in gold-precipitation.

The prepared fume is screened in a flour-miller's bolting machine; owing to its granular character no difficulty is experienced in screening. The product though excessively fine is uniform in size of particle and free from dust; under the miscroscope each grain is seen as a brilliant metallic sphere. A word may be said as to the perfection of the bolting machine for screening fine powders; this has been developed to meet the stringent requirements of the corn-milling industry and if better known would no doubt find application in screening dry crushed ore.

A wider general knowledge of the practice of industries other than our own would, I believe, lead to the discovery of many appliances which could be adapted to our special needs. For example, the filter-press was well known to the potter before its value was recognized in ore treatment. He has, from our point of view, the worst possible type of clayey material to filter and in addition contamination by iron rust must be avoided; hence he adopts a press with wooden frames. We could perhaps reciprocate by introducing to him the vacuum-filter and pulp-thickeners.

Pottery. While on the subject of pottery an interesting application of gold may be referred to, though this perhaps comes rather within the province of chemical industry than metallurgy. It is not commonly recognized that the gold decoration of cheap pottery consumes a large amount of the metal in such a manner that it never returns to the market. The gold-line decoration on cheap cups and the 'solid' gold handles on cheap 'ornamental' vases is in fact gold of almost the highest degree of fineness employed in the arts. The compound as employed consists of an organic salt of gold in an oily medium, and as applied does not contain more than about 6-9% of metal. The desired decoration is painted on the otherwise finished ware, which is then heated to about 700°C., far below the melting-point of gold. Over 90% of the compound, consisting of the oils and medium, is thus burnt away, leaving the perfectly uniform coherent film of gold with which we are all familiar. The metallic components consist essentially of pure gold, but modified to the extent of about 1% with other metals, which brings about the brilliant metallic film; and it is interesting to remark that if absolutely pure gold be employed no such film would result, the effect being instead a dull earthy pink deposit. This affords another example of the influences of a small amount of a foreign metal on the mass, a feature so frequently met with in almost every branch of metallurgy. So coherent is the film, in spite of the loss of over 90% of the original compound, that it may be used as a satisfactory base for electro-deposition thereon of another metal, such as silver, for decoration or other purposes. Platinum behaves in a similar manner, and it is possible that for certain purposes porcelain dishes coated with gold or platinum by this means may be of service in the laboratory.

As another illustration of borrowing from other industries, the metallurgical furnace-builder may derive much assistance from the glass industry and *vice versa*. Oil-firing, now so commonly employed in smelting, is well known to the glass-maker, who may have experience in its use not generally known to the metallurgist. My object in the above remarks is to call attention to the advantages which must result from a freer interchange of knowledge and experience between our various industries. To this end one of our leading societies, the Society of Chemical Industry, has in normal times an annual program of visits to various works, giving members the opportunity of inspecting operations in which they are not directly interested.

Copper. For developments in the metallurgy of copper we naturally look to the United States. Thanks to the publicity given to progress in the States and to their excellent technical publications, we have been made familiar with recent advances and it thus becomes unnecessary to refer to them in detail. Among such, reverberatory practice (due to the ever-increasing amount of flotation concentrate to be smelted) may be mentioned. In this connection the increased throat-area, with correspondingly larger burners for oil or coal-dust firing resulting in largely increased output per furnace, should be noted. The El Paso 130-ft. furnaces burning oil have reached a daily capacity of over 960 tons with a consumption of 0.61 barrel of oil per ton. Leaching of oxidized copper ores by ammonia, so often suggested in the past, has come within the domain of practical metallurgy. For example, it is reported that the Calumet & Hecla Mining Co., in a plant treating 2,000 tons of tailing per day, is recovering copper at a total cost of 6.25 cents per pound, with a loss of only one pound of ammonia per ton of ore. Further developments have also taken place in acid-leaching plants in connection with which A. W. Halin's process deserves mention. He passes the acid solution through a number of ore-charges until the solution becomes neutral. It is then delivered to a tank containing fresh ore whereby the ferric iron is precipitated, whence, after acidification, the solution passes to the electrolyzing plant for precipitating the copper. The treatment of ore in heaps by leaching, following Rio Tinto practice, is also being extended in America.

In this country the industry cannot be said to be flourishing, though in spite of war conditions, and partly because of them, some notable achievements have been effected. One instance of overcoming a serious difficulty may be cited, as showing the adaptability and resourcefulness of our metallurgists. In this case the ores to be smelted demanded the addition of pyrite, hitherto imported from Spain. Owing to the requirements of the Governmnt for Spanish pyrite for acid-making this source of supply was cut off, threatening the closing down of the smelting operations. A new and hitherto neglected supply was, however, developed by the manager (one of our members) from the pyrite seams of the Welsh collieries, and it is satisfactory to record that this source now meets all the requirements of the works, not only for sulphur, but when calcined it is available as iron flux for smelting oxidized ores. The neglect to make use of this supply in the past is no doubt due to the reluctance of colliery proprietors to admit the existence of sulphur in their mines, as it might reflect on the quality of the coal. However, they now recognize that they have in pyrite an asset of value; moreover, it now pays to mine coal-seams rich in pyrite that hitherto have been left. The pyrite is recovered by hand-picking on belts. In the result the copper-works now secure ample supplies at a cost considerably below that previously paid for Spanish mineral; it is strange that this material has been overlooked by acid-makers in spite of the great demand created by the War.

As producers of copper we can, of course, never expect to compete with the United States, but, given a measure of State assistance, we ought to be in a position to secure for treatment a fair share of ores and matte from our own Dominions. For this purpose increased electrolytic refining capacity is certainly needed, but until some security for the industry be assured there is no inducement to capital to embark in such undertakings. The ever-growing demands of labor, with consequent increase in the price of raw materials, unless checked, must inevitably tend to drive the industry to countries where easier conditions prevail. The recent heavy fall in the price of the metal due to over-production, and the withdrawal of consumption for war purposes, calls for economy in every direction; it also points to the necessity for State action, failing which it is difficult to see how the industry can survive.

The Metallurgy of Gold, in so far as it relates to the recovery of the metal from its ores, shows general improvement, but nothing of first-rate importance except perhaps Crowe's method of precipitating cyanide solution under reduced pressure. He shows that the air dissolved in the solution, has, owing to the different co-efficients of absorption, a composition of 35% of oxygen and 65% of nitrogen, and consequently is a more active oxidizing agent than air of normal composition. He points out that in weak cyanide solutions, consequently with a minimum of hydrogen being generated, the oxidizing action of the dissolved oxygen largely neutralizes the reducing action and may even overcome it. In normal practice this is met by adding lump cyanide at the head of the precipitation box, with consequent increased consumption of both cyanide and zinc. By the adoption of the vacuum process this practice is unnecessary and extraction may be effected with weaker solutions resulting in savings in all departments, including the production of a purer bullion. The Portland Gold Mining Co. reports a saving of $30,000 per year in zinc and cyanide in a plant treating 2,000 tons of ore per day. It is interesting to note that G. T. Hansen claims similar advantages by heating the solutions to 170° F. before precipitation.

Concentration of gold ores by flotation is making progress, but the field for this process is somewhat restricted, owing to the general high efficiency of the older methods. At Cobalt, flotation has replaced gravity concentration, although at the Nipissing mine this process has been rejected, not on account of its inefficiency, but because of the difficulties in subsequent treatment of the concentrates. On complex gold-silver concentrate involving further treatment, the advantages of flotation compared with ordinary concentration followed by cyanide are not so manifest. The value of flotation as a means of increasing the world's output of gold lies rather in improved recovery of base metals, such as copper, with which gold is so commonly associated.

With reference to the production of gold, and more particularly to the question of a bounty, this is a matter for settlement between the economist and the producer. It is a subject upon which so many varying opinions have been expressed by authorities that it is difficult to arrive at any decided conclusion. So far as our own direct interests are concerned, a bounty on gold would be an obvious benefit, as we have many members engaged in this industry, though the objections to this course are also weighty.

A committee of the Council of the Institution appointed to report on the position of the gold output of the British Empire made an exhaustive inquiry into the subject, and issued their report in March, 1918. This shows that a reduction of 20 per cent of the Empire's gold production is visibly imminent, and this at a time when the need for gold is ever more pressing.* There can be no two opinions as to the vital importance of not only maintaining but also increasing our gold supplies, and with the object of effecting this the committee recommend a 10 per cent bounty on the output of all struggling mines or alternatively a bounty of two shillings (48c) per ton of ore treated. Proposals on these lines, however, were not acceptable to the Government Gold Production Committee.

It seems self-evident that unless relief in some form be granted, the production of gold must necessarily fall by the stoppage of the lower-grade mines; apart from the influence this would have on the general economic position, as to which opinions vary, a serious injury would be done to gold mining as an industry. Lord Inchcape's committee, however, is not disturbed by the prospective stoppage of these mines, and does not consider such an eventuality to be of any great importance to national interests† Although there may be objections or difficulties in the granting of a direct bounty it would not appear impossible to concede some remission of taxation, and to this extent relieve the industry

*The accuracy of this forecast is shown by a recent question in the House of Commons in which the Chancellor of the Exchequer was asked if he was aware that there had been a drop in the gold production of the British Empire of 13½% in the year 1918, compared with 1915, and that the world's production showed a drop of 20% in the same period. The figures given were not questioned.

†Since these words were written the Chancellor of the Exchequer has stated: "There is nothing in the report of Lord Inchcape's committee to suggest that producers of gold are not entitled to obtain for their produce the best price available in the most favorable market, and I am now considering in what manner this can be secured."

of some of its unfair burden. We already have a precedent for such action; children are considered to constitute a valuable asset to the State, and in principle, though to a very slight extent, taxation relief is granted to the producer. Why, therefore, should not similar action be taken in regard to gold?

Lead. In the metallurgy of lead, also, recent advances seem to be in detail rather than in fundamental improvements. In the stress of recent years there has been small opportunity of developing new processes in industries that are well established on recognized lines, such efforts being rather devoted to specialties called for by the War. Mention, however, may be made to progress in hydro-metallurgy, as applied to oxidized lead ores. This has been limited to brine treatment with or without the addition of sulphuric acid to carbonate and sulphate ores. This process has been tested in America as well as in North Wales, where a small plant was working until the difficulties of obtaining supplies caused a temporary cessation of operations. In this case the material to be treated consisted of an extensive dump of blende and lead sulphate slimes. Vanner concentration yields a mixed product of no value until further separated. This is effected by agitating the concentrates with hot saturated brine at 70°C., whereby the lead sulphate is completely dissolved, with, of course, the equivalent formation of sodium sulphate. The presence of this salt in growing proportions interferes with the solubility of the lead sulphate, and must therefore be removed by the addition of the equivalent amount of calcium chloride. The lead solution is filtered from the blende-calcium sulphate residues, and precipitated with slaked lime, reforming a portion of calcium chloride; about 50 per cent of the chloride is regenerated, the balance of the chlorine being precipitated with the lead as oxy-chloride. The blende-calcium sulphate residues are then re-treated on a vanner, which effects perfect separation of the easily removed flocculent sulphate, leaving a saleable blend concentrate. The chief objection to the process lies in the chloride present in the lead precipitate involving volatilization loss in smelting, but this may be overcome by precipitating the lead by electrolysis, using soluble iron anodes. This process is limited in its usefulness by the relatively small quantity of material available and by its inapplicability to silver or gold contents. It may, however, develop in the direction of the treatment of low-grade sulphide ores, after a sulphating or chloridizing roast at a temperature low enough to prevent the volatilization of the lead chloride.

In the province of general metallurgy the increasing use of the Cottrell process deserves special mention. As an example of painstaking research in developing a practical process from a long-known but unused scientific fact it has few equals. We have to go back to 1870 to the work of Dr. Tyndall for the first disclosure of the phenomenon on which the process is based. This was further examined by Frankland, Lord Rayleigh, and Oliver Lodge; but for the useful application of the principles involved, we had to wait for Dr. Cottrell. He first applied the method to depositing sulphuric acid mist produced in the contact process, and is still being used for this purpose. It is satisfactory to report that the merits of the invention have been recognized in this country, the first plant to be erected here in 1917 being at one of the Government acid-plants. It is also in use here for the precipitation of fumes from metallurgical works, following established practice in America; its further extension in this country seems certain. The advantages of the process are far-reaching; not only are valuable products recovered, but agriculture in the neighborhood of the operations is saved from serious damage. We are glad to congratulate Dr. Cottrell on receiving the Perkin medal as a recognition of his valuable services to industry.

The Metal Industry. In considering the position of the metal-producing industry before the war, one cannot but be struck with the apathy of the Government in regard to a matter of such vital importance to our security. It is true that as soon as the seriousness of the position was realized, energetic steps were taken to meet the situation. That within such a comparatively short time the difficulties were overcome is a striking tribute to the ability and energy of the technical men in this country. Industries were created and developed in a period of months which had been the subject of many year's growth on the part of foreign producers; not only were we able to produce articles equal to those obtained from abroad, but in many cases higher standards of purity and efficiency were achieved. The production of high-grade tungsten already referred to is an example of this, while in other directions the manufacture of magnetos and optical glass has reached a state of perfection unsurpassed by makers possessing prolonged experience.

These facts demonstrate that our position in pre-war days was in no sense brought about by lack of technical knowledge or skill, though it has been usual to refer to our inferiority in this direction, as well as to lack of initiative and energy, as being the true cause. The experience of the war shows this view to be unfounded, and that given reasonable facilities and the absence of official and fiscal discouragement we can, so far as technical knowledge is concerned, place ourselves in the front rank as producers of all essential materials. This charge having been proved to be baseless, it is clear that in order to maintain our position as producers some protective steps must be adopted; failing this, there is every reason to suppose that our new or revived industries will relapse into their pre-war inefficiency. It is reported, for instance, that efforts are being made to re-introduce foreign glass into this country, which if successful (unless effected under conditions which will protect our own manufacturers) cannot but tend to harm, if not to destroy, an industry which, under war conditions, has succeeded in re-establishing itself.

I am, of course, referring here only to such industries as were either non-existent or were in a struggling state, and this condition obtained largely in the production of certain essential metals. This possibility has been officially recognized, and committees have been formed to examine into the problems and make recommendations. Lord Balfour of Burleigh's committee on commercial and industrial policy after the war has made an exhaustive inquiry into the subjects covered by the Terms of Reference. A study of the committee's final report reveals the complexity of the subject. The departmental committee's report on the iron and steel trades ascribes the relatively stationary condition of this industry in part to deficiency of our iron-ore resources, but primarily to greater efficiency of German and American methods.

A point is made of the individualism of the British character which prevents the manufacturer from "pooling his brains and capital to the greater ultimate ad-

vantage of the industry." This would appear to be a just charge. It is well known that with few exceptions large amalgamations are not looked upon with favor in this country, where moreover every effort is made to maintain secrecy in regard to working processes and operations generally. I cannot say from personal knowledge how far this applies to the steel trades, but it is very evident in other metal-producing industries. I am satisfied that nothing but benefit would result from removing the restrictions to open discussion which persist in this country. We should do well to open our works to the visits of technical men interested in the subject, as this would inevitably result in the exchange of experience and information to mutual advantage. The present attitude is certainly not dictated by the technical managers, who as a body would welcome such an interchange of knowledge, but are excluded from this benefit by the action of their employers.

W. R. Ingalls, in his admirable presidential address before the Mining & Metallurgical Society of America this year, says on this subject: "One of the cardinal principles of American engineering during the last 20 years has been the exchange of information and the promotion of publicity about everything—technical processes, business relations, corporate affairs. We have seen America forge ahead largely owing to the absorption of this idea, while Great Britain lagged behind. . . . She is wide awake now."

It is to be hoped that the awakening referred to has indeed taken place. Apparently this secrecy is not confined to our own special branch of industry. C. F. Cross, in 1916, on the occasion of the presentation to him of the medal of the Society of Chemical Industry, said: "He was particularly aware of the difficulties which they had encountered, especially that of being between the crossfires of the commercial or financial man whose watchword was secrecy and the scientific man whose disinterestedness, perfectly natural and spontaneous, led him always to wish to publish in order that he might communicate what he had found in his laboratory to his fellow scientific men. . . They . . . were always most anxious to take counsel with their brother chemists, and give them the benefit of anything that had impressed them, just as they looked to hear of any new discovery by others at the earliest possible moment."

This condition is reflected in our own Transactions (and to a less extent in our technical journals), which contain but little information on important undertakings in this country. In analyzing the papers published in the last ten volumes of our Transactions, I find that 35.8 per cent deal with mining in foreign countries and our dominions and colonies. Foreign, etc., metallurgy supplies 17.3 per cent; assaying and analysis 15.0 per cent; general 27.7 per cent, whereas British mining in these islands is confined to a solitary paper, and British metallurgy to six papers, or 3.5 per cent of the whole. It is true that some of the general papers find application here, but the record can only be considered as unasatisfactory in that it fails to present in any adequate manner important operations which we know are being conducted. I hope these remarks may have some effect in removing the veil of secrecy which overshadows our undertakings.

Reverting to the committee's report, the Departmental Committee (iron and steel) favors combination both in production and in realization of produce, but is also of opinion that protection in some form is required to give security to industry. Other departmental committees report on similar lines, ten such being in favor of a tariff, while three (representing the cotton, jute, and building industries) report against. The main committee is by no means unanimous on the point, but it should not be beyond the capacity of the Government to reconcile the conflicting views, and decide on the course most advantageous to the country as a whole. It would be out of place and indeed superfluous to discuss the well-worn arguments for and against tariffs, though it would probably be found that the majority of the members have very definite views on the question.

Though the committee leans toward protection it expresses the fear that such might result in stereotyping inefficient methods, but in my view there is little ground to support this, I anticipate, on the other hand, that the feeling of security engendered by a suitable degree of protection would stimulate producers to adopt modern methods involving capital expenditure which under present conditions they decline to risk.

The committee is strongly of opinion that State control will be found detrimental to peace conditions, a conclusion with which most will agree, though recent action in regard to both coal mines and railways does not encourage the hope that this opinion will find favor. It is also eminently satisfactory that they agree with the resolution adopted by the Imperial War Conference as to the formation in London of the Imperial Mineral Resources Bureau. Much of the foundation work of the bureau has been accomplished, and there is good ground for anticipating that the hopes of its promoters will be realized.

It was my intention to discuss in some detail certain aspects of the problem of reconstruction in so far as our special interests are affected, but these have been so fully and carefully analyzed by W. R. Ingalls, in his address already referred to, that little remains to be said. I am in no sense detracting from the merits of his remarks when I say that he is addressing those who are already converted, but few have the knowledge and ability to put the case so succinctly and convincingly. It is earnestly to be hoped that it may come into the hands not only of Labor leaders, but of those in control of Government departments having relations with mining and metallurgical matters. Naturally he deals mainly with American affairs, but his arguments bear with equal force on conditions existing here. He makes reference to these, but in my view his opinions on our position are somewhat too sanguine. He will pardon me for giving one or two extracts. He quotes the view of an American visitor to this country, who says:

"England is knitting together for work. The directors of capital and organized labor were never more together. . . . England is studying efficiency and is preparing for overseas competition."

Mr. Ingalls himself says:

"We have seen how Great Britain practically lost important metallurgical industries . . . and we see her now keenly studying and introducing improvements that will . . . not unlikely put her ahead of us."

It will be admitted that there is some tendency in this direction, but the union and progress foreshadowed are still far from achievement. No doubt his reference to conditions in Europe are designed primarily to stimulate the efforts of his own countrymen. The ever-growing concessions of shorter hours at higher pay must be carefully watched in their effect if we are to

maintain our position against foreign competition. From this point of view it is almost a matter of satisfaction that similar claims are being put forward in America.

Mr. Ingalls in his masterly address shows the economic fallacy underlying such demands as have recently been pressed. I take the liberty of making two more quotations: the first, addressed to the American engineer, has equally forceful application to ourselves:

"First of all, what I see is that the engineer should saturate himself with sound economic doctrine. This is just as much the basis of his professional work as are the sciences of physics and chemistry."

The second will, I hope, reach the class to whom it aptly applies:

"The social reformer, who does not understand production, is a far less important person in the promotion of human welfare than the engineer who does."

The principles he lays down as to the general economic position apply with perhaps greater force to this country, since we are to so large an extent dependent on overseas countries for our supply of raw maerials.

It is beyond my capacity to forecast the future of metallurgy in this country. Our industry is suffering in common with many others from the lack of any clear indication of the fiscal policy of the future. The Minister of National Service and Reconstruction has certainly stated that all raw materials required for national industries would be admitted without restriction, but whether this applies only to the reconstruction period or is to be the final settled policy, seems uncertain. So far as his statement goes it indicates that ores, which are essentially raw materials, will be admitted freely, and to this extent the smelting industry would benefit; but if metal, such a spelter, which may be looked upon as raw material from the galvanizer's point of view, is also included in the list we may have a hard task to hold our own. In regard to this, however, there is ground for a hopeful outlook, as he also intimated that industries which it was essential to foster would receive a measure of protection in some form. I think it will be admitted the production of metal is among such industries.

Regarding the labor situation, we are, I think, justified in anticipating that the Industrial Conference will lead to greatly improved relations between Capital and Labor, though up to the present some of the more important groups have held aloof from the Conference. It is to be hoped that legislative effect will be given promptly to the proposals and that the National Industrial Council will be the means of promoting and maintaining industrial peace.

Though the future may be beset with difficulties it is not the time to take pessimistic views, but rather to use every effort to meet them and to accommodate ourselves to the new conditions brought about by the war. Shakespeare puts the following lines into the mouth of King Henry V when in a position of difficulty before Agincourt:

". . . . 'tis true we are in great danger;
The greater therefore should our courage be.

. . . . . .

There is some soul of goodness in things evil
Would men observingly distil it out.

It is in this spirit that we must go forward, striving if possible to extract the small essence of goodness which may, after all, be extractable from the vast slough left to the worl das a war legacy.

THE NORTHERN MANITOBA FIELD.

By R. C. WALLACE.

Prospecting is now general throughout the northern Manitoba belt and the prospectors have distributed themselves without partiality over a wide area. There has been a marked inclination to go further afield on the Hudson Bay Railway as far as the first crossing of the Nelson River and even further, a fact which in itself demonstrates that the railway is the incentive to development work and investigation of every kind in the north. The greatest interest, however, still centres around Athapapuskow Lake.

Since last fall there have been two discoveries on the western part of that area in the belt in which lie the Mandy and Flin Flon deposits at the North end of the North-East arm of Schist Lake.

The Davidson Copper Discovery.

A discovery was made by Pete Davidson of high grade chalcopyrite ore occurring in stringers at the surface but showing very promising indications of width at a depth of six feet. Prospecting is continuing at depth on this deposit in order to ascertain the extent of the ore body. The samples which have been brought down to The Pas show an intimate mixture of chalcopyrite and pyrite with values in copper considerably less than the best Mandy values, but undoubtedly sufficiently high to represent good profits provided the ore-body proves to be fairly large.

The discoverers of the Flin Flon property uncovered very high grade copper ore on the east side of the middle arm of Schist Lake and some few miles east of the Manx property. The values compare very favorably with the Mandy ore, but little development work has yet been done to ascertain the size of the body. Work continues on the chalcopyrite and pyrite showings in the epidotized greenstone on the East Arm of Athapapuskow Lake and thence eastwards through the first and second Cranberry Lakes to Copper Lake, where Peterson and Gordon are investigating a property which shows rather abundant galena in a quartz base and gives on assay good values in gold and silver.

Herb Lake.

In the original Herb Lake field development has been somewhat delayed by the inability of Makeever Bros. to operate the Rex mine under present conditions of labour and with the obligation for development which they are compelled to meet in their properties in Mexico. There is reasonable assurance, however, that the mine will be operated before the close of the summer and that the necessary underground development work will be first carried out to make it possible to feed the mill to capacity. There are other properties in the district which should not be held back because of this temporary delay in operation, and capital has been and is interested in the taking over of several of the best of the Herb Lake properties.

Prospecting is also going on on Wintering Lake, on the Pipe Lake belt, on the Burntwood River and at several points in the neighbourhood of the railway as far north as the Manitou Rapids. Samples that have recently come out from the railway belt show that there is scope for successful prospecting on more than one point in the neighbourhood of the railway, while the transportation facilities which are provided, form an additional incentive for prospecting in this district.

Flin Flon Negotiations.

Mr. Hammell has recently had a consultation with his partners in the Flin Flon property relative to the

basis of a deal which he hopes can now be negotiated with a very important mining corporation in the East. The declaration of peace and the steady and very satisfactory rise in the price of copper, which, there is every indication, will continue for some time, are factors which will assist Mr. Hammell greatly in negotiating a deal. The early operation of the Flin Flon property would be a factor of very great importance for the whole district, not only from the point of view of mining development, but in many other ways, and every assistance that can be given by both the Federal and Provincial Government will repay the authorities very handsomely in the increased actual wealth of the province and the country.

If it be found advisable to develop the power for the operation of the mine and district from the Churchill River, and if a narrow gauge light-railway system were maintained in operation (as it should be) after the power development and transmission line are completed, the famous Sturgeon fisheries of the Churchill River and the very valuable fisheries of Reindeer and South Indian Lake could be tapped and for the first time made accessible to the markets.

Transportation and Power.

The Dominion Government, through the C.N.R., has specifically promised to build a railway from The Pas to the smelter. The Provincial Government has recently passed an act enabling the Government to operate and transmit water power, and should undoubtedly assist, if the opportunity arises, by supplying the power necessary to operate both the property itself and the smaller mines which would require the use of power. In an undertaking of the magnitude that the operation of the Flin Flon demands, a share of the burden of the initial capital, in so far as that is possible, should be carried by the Governments concerned in the spheres, such as railways and water-powers, in which they are more directly concerned.

Display of Ore Samples.

A display of ore samples from the northern district was recently sent to the International Mining Convention at Nelson, B.C., where there were represented a very large number of collections from the Eastern British Columbia area and the Northern States. Arrangements were also made to have samples from the other Manitoba fields represented, but the unfortunate tie-up of the express service made it impossible to send samples to the Nelson Convention in time. For the Northern Manitoba collection, two first prizes were obtained and two special diplomas. No other collection obtained two first prizes and only very few special diplomas were awarded at the whole convention. To the Mandy ore came one of the first prizes and special diplomas. To the Northern Manitoba Mining Co. at Herb Lake, came the other first prize and special diploma. Other prizes were obtained for gold and nickel and there is no doubt that the convention was impressed with the fact that Manitoba stands no longer on its reputation as a wheat-producing province alone. Mr. H. MacLeod was in charge of the collection and reports that a great deal of interest was taken in the collection and that many who are interested will personally examine the field in the month of August. A paper by R. C. Wallace was read on "Mining Development in Northern Manitoba" and the local papers were supplied with material relative to the work in this area. One of the most fruitful methods of stimulating interest and development in all mining fields in the Province will undoubtedly be found in the display of good representative collections, fully labelled and with sufficient descriptive material, accurate in character, to convince all mining men and mining financial interests. With the co-operation of mining districts further south in the Province, this will be made a feature of all future mining conventions.

Special Correspondence

NORTHERN ONTARIO.

Boston Creek District—Government Blamed for Lack of Roads.

The failure of the Ontario Government to assist in the development of the Boston Creek mining district is uppermost in the thoughts of those citizens of Northern Ontario who possess a genuine sense of fair treatment to those concerns, backed by capital from abroad, which have chosen this district as the most attractive place in which to apply their efforts at mine development.

Early last spring, the Ontario Government, through Hon. G. Howard Ferguson, stated that a road was to be built for the accommodation of the mines in that district. The summer is now well advanced yet not a shovel of dirt has been turned. Instead, privately financed companies find it necessary to maintain their own roads, not only for their own benefit, but for the benefit of the entire camp.

In the Miller-Independence section of the district a lot of money has been spent, with very successful results. The Independence has alone spent about $300,000, and will expend perhaps another $100,000 before the end of this year, by which time it is expected to be treating ore at the rate of about 75 tons daily. This company is financed from the United States, chiefly from Dayton, Ohio. The Company has built its own road and has maintained it, and the Ontario Government, despite the fact that a large number of other property owners use this road, has not seen fit to even lend assistance in its upkeep.

In addition to the rich ore-bodies proven to exist in the Miller Independence section of the Boston Creek district, the area farther east, in the townships of Catherine and Skead, is attracting more and more attention. The mining companies operating in the Skead area are seeking a road to the Boston Creek station by way of the Miller-Independence mine. The distance from Skead to the Independence is about thirteen miles, and would necessitate the construction of a bridge across the Blanche River. They are asking the government to build the bridge and to advance two-thirds of the cost of building the thirteen miles of road. These companies would pay one-third of the cost. The road would pass through one of the most promising prospective mining areas in the north.

Within the next three months many carloads of materials will have to be transported over the road from Boston Creek station to the Miller-Independence mine, a distance of about three and one-half miles. Coal alone will average about one carload each week. Carloads of lumber, cement, machinery and supplies must be taken in before bad weather sets in. As a consequence, this company is obliged to prepare and maintain a road, not only for its own use, but for all the other mines in the district.

The development of the whole Boston Creek district is being retarded by the neglect of the Government to redeem its promise to provide road facilities. So far, the Ontario Government has not spent one dollar to assist highway transportation in this important and promising district. Boston Creek miners are energetically protesting against the unfair treatment they are receiving.

Gowganda to Cobalt by Motor.

That the inevitable connecting of the various districts of Northern Ontario by motor roads is coming about slowly but surely is demonstrated in the fact that an automobile was driven this week from the Gowganda camp, by way of Elk Lake, to Cobalt. The distance is not great, being perhaps not more than one hundred miles along the route of the road. But, the incident attracts attention due to it being the first time the through trip has been made.

The road from Gowganda to Elk Lake, when the present work of macadamizing it is completed, will be a good one, but at the present time it is but a rough waggon road through the bush, some thirty miles in length. Over the first few miles east from Elk Lake it was found necessary to travel over comparatively rough roads, paralleling the Elk Lake branch of the T. & N. O. Ry. There roads were found to improve on approaching closer to the main line of the T. & N. O. Ry., where fair roads are maintained through the farming districts and over which the trip was completed to New Liskeard, and finally to Cobalt over the macadam road passing through Haileybury.

It is learned that Henry Cecil is endeavoring to negotiate a deal for the disposal of the Hohenaur claim in the Kirkland Lake district. Promising progress was reported to have been made this week in Toronto.

It was also intimated that C. E. Wettlaufer, of Buffalo, might become involved. Also, that an endeavor might be made to consolidate the Hohenaur with two or three adjoining properties, including the Hunter-Kirkland.

A fair measure of encouragement and success is understood to be attending operation at the La Rose Consolidated. Recent unofficial reports, however, have exaggerated the situation, it is understood.

The Crown Reserve Mining Company has arranged to have a small amount of exploration work done on mining claims acquired a few months ago in the Larder Lake gold district. The company is also planning a small amount of exploration work on claims recently secured in the Gillies Limit.

McKinley-Darragh's Statement.

The financial position of the McKinley-Darragh, as shown in the statement just sent out, is concrete evidence of the success being met with this year. As of June 23rd the statement shows cash in bank $259,371; ore in transit and at the smelter $134,000; ore at mine ready to ship $57,700, making a total of $469,071. This compares with a total of $346,861, as of March 22nd.

During the second week in May the excellent physical condition of the McKinley-Darragh was pointed out in these columns. It was shown that net earnings were far in excess of dividend requirements of 3 per cet. quarterly or 12 per cent. annually. The official statement just submitted to shareholders corroborates the advance information printed in this paper about two months ago.

It is a further interesting fact that the present high production is being achieved with a force of men considerably less in number than the average employed throughout 1918. During recent months, working forces have been reduced to about 180 men, a reduction of about twenty per cent. A number of changes have been made and a high degree of efficiency is obtaining.

The dividend of 3 per cent. paid this month amounted to $67,428 and makes a total of 9 per cent. or $202,284 distributed so far this year. That the present rate of dividends will continue for years would appear to be certain. First, is the fact that the $469,071 now on hand is sufficient to care for dividend requirements beyond the first quarter of 1921 without drawing from profits made from operations in the meantime. However, at the present rate of output, not only will this surplus of about 20 per cent. be left intact for use at some later date, but current earnings may add to the surplus in addition to covering the 12 per cent. annual dividends.

Present Price of Silver Increasing Cobalt Returns.

Readers have been shown recently in these columns that the output of silver from the silver mines of this district will have reached the total of $306,056,976 fine ounces by the end of the current year, and that the total value will approximate $184,641,387. This shows that the quotations for silver since 1904 have averaged approximately 60 cents per ounce. It further shows that had silver averaged $1.10 per ounce as in the month of June this year, the entire output since 1904 would have a value of approximately $336,662,673.60, as compared with $184,641,387 actually received. In a word, provided silver quotations are to rule as high as an average of $1.10 an ounce, then Cobalt lost approximately $152,021,286.60 by having been discovered and mined during a period of the lowest silver quotations in history.

However, the mines of Cobalt are not worked out, and the camp as a whole will be a heavy producer of silver for a good many years. The mining companies operating in this field produced $12,135,816 in 1915, with silver averaging a little under 50 cents an ounce. With silver considerably more than double the 1915 average, the added value more than makes up for the lower output in point of ounces, and 1919 promises to be a more prosperous year than was either 1614, 1915 or 1916.

Had the situation been reversed, it is probably true that the majority of the mines in this district would at present be closed down. That is, haw silver averaegd above $1 an ounce during the early years of mining in Cobalt, and dropped to around 50 cents an ounce at the present time, the camp would not be the big thriving industrial centre that it is to-day. It is fortunate therefore, that the rise in quotations for silver has taken place at a time when most needed, and that the lowest average occurred just at a time when the camp was in its prime and in excellent physical condition to stand the strain.

Therefore, although low silver values in the early years of the current century denied the mining companies scores of millions of dollars, yet the fact that good fortune now smiles radiantly upon the silver producing companies, serves to offset the unfavorable silver market in the early days.

NORTHERN ONTARIO (Continued)

Low Fatality Rate in Northern Ontario Mines.

Previous reference has been made in these columns regarding to the fact that there was no fatal accidents during 1918 in connection with the silver mining industry of Ontario. This year the record is not quite so favorable, two men having already been killed.

When it is considered that close to three thousand men are employed at the silver mines of this province this record compares favorably with the best in the world. For instance, in the United States it is stated that an average of three out of every thousand employed at mining meet accidental death each year.

Clifton-Porcupine Mine.

Satisfactory progress and excellent results obtaining at the Clifton-Porcupine mine bids fair to add still farther to the extent of the profitable gold mining area of Porcupine. It is learned that at the first level where drifting operations are under way the vein is the full width of the drift and carries considerable quantities of visible gold. At the present point of operation the ore is stated to be high grade.

The mining plant is working smoothly and will be sufficiently powerful to meet requirements until the completion of the new and larger electrically driven plant, a part of which equipment has already arrived and a part of which is in course of transportation. With the completion of the new modern plant it will be pressed immediately into service. The present temporary plant will then have served its purpose and no delay will have been incurred during the period of installing the new equipment.

General Mining Notes.

In addition to the usual amount of ore from underground, the Mining Corporation is treating about 300 tons of tailings from previous operations. For the time being the tailings are being drawn from a large stock pile at the west side of the railway, but the work of pumping from the bed of Cobalt lake will begin very shortly.

Up to the present the new oil flotation equipment has not been used due to the fact that cyanidation is being found satisfactory. The material being treated is first ground to forty mesh.

Alfred R. Whitman is stated to have been engaged as consulting geologist for the Boston-McCrea property at Boston Creek. Mr. Whitman made his first visit to the property last week, and will make a re-study of the property accordingly as the occasion appears to demand.

The reported discovery of high grad eore at a depth of 575 feet on the Temiskaming mine is stated to have been incorrect. In view of the policy of the company being decidedly reticient in so far as information as to development work is concerned, the report gained a good deal of headway in a short time.

Milling operations are being carried on by the Pittsburg-Lorrain Syndicate, in South Lorrain with a fair degree of success. Some difficulty has recently been experienced in securing a supply of water, which has caused only temporary inconvenience. The mine and the mill of the Wettlaufer mine are under lease to the Pittsburg-Lorrain.

The action taken by the Tough-Oakes Gold Mines against its former president, C. A. Foster, involving some $1,896, no matter what the outcome of the affair, does not appear to constitute any reason for shareholders of the Tough-Oakes Company to become alarmed lest it should be the forerunner of more serious litigation that would again serve to draw the company into a position where the operation of the mine should suffer.

As far as can be seen at the present time, any future litigation appears likely to be confined to the minor phases incidental to the complete winding up of all differences which at one time existed.

The company is adequately financed to carry on operations in a big way, and following the clearing up of labor difficulties, the mill will be pressed into service, and the company shall then be permitted to enjoy the prosperity which has been held in abeyance, both due to the war in Europe and due to litigation.

The work of pumping out the underground workings of the Marigold property, formerly a part of the Lucky Cross mine, is under way, presumably preparatory to the commencement of mining operations. This step is taken as an indication that work will be started regardless of the present labor strike in that district.

The Adanac has made a shipment of concentrates together with some high grade ore, the whole amounting to between 50,000 and 60,000 pounds. Although detailed figures are not available, yet it is understood the returns from the shipment will serve to place more money in the treasury than the amount with which the current year was begun.

Further exploration work is being carried on, the most promising of which is the driving of a raise from the underlying diabase up into the Keewatin directly above. The vein being explored is about eight inches in width, and contains heavy cobalt mineralization. It is situated on the northern part of the property.

Diamond drilling was commenced this week on the Gold Reef property, situated in the north-western part of the township of Whitney, in the Porcupine district. Some years ago some speculator ore was found on the Gold Reef, the ore occurring in narrow pay-streaks.

MINING PERSONALS.

T. R. Jones, manager of the Buffalo Mines, is in Cobalt, on his regular monthly business visit to the mine.

M. P. McDonald, mining engineer, is making an examination of mining property in the Larder Lake district.

Max Morgenstern, shareholder in the Temiskaming, is paying a visit to the mine this week.

A. R. Whitman, mining geologist, has returned to New York after spending a few days on business in the Northern Ontario field.

Lieut.-Col. Johnston, of the Tough-Oakes Gold Mines, has returned north after an absence of a week or so on business at Eastern points.

BOOK REVIEW

Recent Publication of the United States Bureau of Mines. Abstracts of Current Decisions on Mines & Mining. Reported from September to December, 1918, by J. W. Thompson. Bulletin No. 179.

This useful digest of legal findings on matters relating to mines and mining is the latest volume of a series of great value. The subject index, which is carefully compiled, arranges the contents in a manner that makes reference easy for the non-legal reader, and in addition there is a Table of Cases, which gives the information as to origin of the abstract for legal readers.

An interesting reference is contained in the Chapter on Eminent Domain in connection with the application of one operator to use the tunnel belonging to another operator. It is laid down that the power of the Legislature of Utah in making mining a public use is conceded, and the purpose of the statute should not be hindered by any narrow or technical objections. The importance of encouraging the mining industry of the States must be kept in view, and as this "was the object, intent and purpose of the Legislature in passing the Act, and its wisdom, policy and expediency were thereby determined, a reasonable, fair, just, broad and liberal view should be taken by the court in the interpretation of the Statute."

There is a tendency to break away from the old rigid rules on the subject of "public use," and to enlarge the definition of the term so as to make it synonymous with "public welfare," and the test of "public welfare" instead of the old doctrine of "public use" is being gradually extended with the promise of its becoming the prevailing doctrine in most jurisdictions.

The owner of a mine sought by appropriation proceedings to condemn a joint use of a mining tunnel, the use to be in connection with that of the owner of a tunnel, and where the tunnel was not used to its full capacity by the owner. Proof that the condemner owned a mine and that the cost of the construction of a separate tunnel would be too great to justify this, and if the condemner cannot reach his mineral deposits through the existing tunnel, he will be prevented from removing his mineral deposits. There is prima facie evidence that it is necessary for the condemner to have a joint use of the tunnel in order to develop and mine the ores in his mining claim.

The burden of proof that the use required is a "public use" was laid upon the condemner. As to compensation, it was held that some just method, based upon all the known facts, is all the law contemplates, and is all that can be required in such a case.

This series of decisions seems to afford an important set of precedents in the application of the doctrine of "Eminent Domain" to mining operations. The principle appears to be that minerals constitute a public property, or perhaps, a more correct expression would be that the development of mineral is necessary for the public welfare, and that any condition of ownership which prevents such development, is against public welfare, and is open to correction and remedy by the power inherent in the state as the representative of the people.

Samuel Underhill, superintendent of the Queen Mine, Sheep Creek, died at Spokane, Wash., recently. He had been employed on McCune property in the interior of British Columbia for about thirty years.

MINE EXPLOSION FROM STRIKING MATCH NOT HAZARD ARISING OUT OF EMPLOYMENT.

In the First Division of the Court of Session, at Edinburgh, judgment has been given in an appeal in an arbitration under the Workmen's Compensation Act, between the Woodilee Coal & Coke Company, Limited, Lenzie, and Mrs. A. Robertson, whose husband was a miner in the appellants' employment, and was injured by an explosion in the Meiklehill Colliery. He died as the result of his injuries. The explosion occurred on his striking a match to light his pipe, after finishing his piece, at the customary knock-off in the middle of the shift. The possession and use of matches in the pit were prohibited by the Coal Mines Act, 1911, and these prohibitions were known to Robertson. Sheriff-Substitute Kippen at Dumbarton found that the explosion was an accident arising out of and in the course of the employment, and in law that the appellants were liable to pay £300 of compensation to the widow.

The First Division reversed that finding, holding that the deceased added a new peril to his employment by striking a match against prohibitions. What he did was for his own purpose, and was innocent enough but did not arise out of his employment.

Special Correspondence

The Silver Bell Mine, situated on the south fork of Kaslo Creek, and the Silver Bear group of mineral claims, which adjoin each other, are to be consolidated. The Silver Bear group has recently been acquired by the owners of the Silver Bell mine and it is understood that the development of the two properties is to be proceeded with this season.

There is said to be a renewal of interest in mining along the Upper Kootenay Lake, which is evinced in development work on a number of properties which have been comparatively inactive. The Blue Bell mine at Riondel, the operation of which has been interfered with by the flooding of the mine workings, is being pumped dry and probably will be in a position to resume mining and milling operations at an early date. This, of course, is contingent on lead marketing conditions improving. In the meantime it is likely that shipments of carbonate will be resumed. The carbonate ore which is of a rather low grade, but the mining costs of which are not heavy, formed a considerable portion of the tonnage sent out from the Ainsworth mining division last year. With the slump in lead prices following the signing of the armistice these shipments were discontinued. The Curle Manganese properties, near Kaslo, is to be operated again this summer, a small shipment of this class of ore having been asked for by the Consolidated Mining and Smelting Company. The Cork Province Mill on the south fork of Kaslo Creek is running on a one-shift basis. The Index Mine is being developed by Spokane capital. A two-ton motor-truck was imported recently for use in connection with this property. This is the first motor truck used in the south Fork section.

Taylor Engineering Co's Titles.

On Saturday, July 5, Land Registrar Smith raised objections in supreme court chambers to registering the title of the Taylor Engineering Company in the Dolly Varden mineral claims because of his construction of the Land Registry Act. These objections were over-ruled by Mr. Justice Murphy, who pointed out that the legislature had passed a special act stating that in the event of two conditions being proven it conveyed the rights in question to the Taylor Engineering Company and whatever the consequencves, the registrar must comply with the act. He then ordered the title registered.

W. M. Archibald, field engineer for the Consolidated Mining & Smelting Co. of Canada, reports that the plant destroyed by fire recently at the Old Sport Group of Mineral Claims, West Coast of Vancouver Island, has been replaced and that development work again is in full swing. Two diamond drills are at work on the surface. The showing so far, it is stated, are very encouraging, the most satisfactory result being the uncovering of a number of high-grade shots of ore. These, in addition to the large body of low-grade ore which there is no doubt is abailable, makes the proposition a good one. Mr. Archibald, however, is doubtful whether any extensive work will be done in the direction of opening the property on a large scale until conditions generally are more stable. In making this observation he refers to the question of labor as well as that of the cost of supplies. However, when the problems which large industries now are facing are more or less settled there is no doubt that the Old Sport Group will be made a shipping mine, second to few in importance in this Province.

M. E. Purcell, of the engineering staff of the Consolidated Mining & Smelting Co. of Canada, recently inspected some iron properties on Iron Mountain, near Merritt, B.C. He appeared satisfied with what he had seen and stated that it was his intention to make a more exhaustive examination at a later date.

Interest in the mining properties of the northern section of British Columbia, to which the town of Stewart is the gateway, continues keen. Charles Caldwell, the operator of the Kootenays, who recently acquired interests in Portland Canal, predicts that the Stewart-Salmon River Railway will be under construction this year. He states that a company has been formed, that the necessary capital will be provided, and that tenders for the contract will be invited in the course of a few weeks.

Meanwhile the development work on various properties which have gained considerable renown recently proceeds and, if reports from usually credible quarters are to be believed, the showings are such as to justify optimistic prophesies. The Premier Mine, for instance, is said to have encountered high-grade silver ore in one of the lower tunnels.

S. I. Silverman, of New York, is expected at Stewart during the summer and P. Welch, the Canadian Railroad Contractor, who is a heavy owner of mining property on the Salmon River, is visiting the district.

A compressor plant has been installed at the Maple Leaf Mine, Franklin Camp, near Grand Forks, B.C. This has been done to facilitate development work and in the opinion of P. B. Freeland, Resident Government Mining Engineer, is an encouraging indication of the determiatio of some of the owners of this camp to prove their properties.

Sir Donald Mann, who with Sir William Mackenzie, is the builder of the Canadian Northern Railways in Canada, now absorbed by the Canadian National Railway System, passed through Vancouver, B.C., a few days ago on his way to examine the Big Missouri Property, Portland Canal, as well as to inspect other holdings in which he is interested in the Portland Canal District. In a statement made before going North he stated that the Big Missouri was not a mine but was a good prospect. He was not in a position to say anything more about it, but if it looked good he would send an engineer from New York to inspect and report upon it. Sir Donald said that it was not his present intention to arrange for the operation of the railway which was constructed some years ago in the Portland Canal Country.

The development of large copper deposits on the Ecstall River by the Granby Consolidated Mining & Smelting Co., is being carried on energetically and with good results, according to word from that camp. While the ore is said to contain considerable sulphur this will not interfere with its economical utilization, it being pointed out that smelting processes have been so improved that while this may have been a serious disadvantage in the past it now offers little difficulty in respect of treatment. Work of an exploratory character has been under way on the Ecstall Property for two years, and it is stated that the showings developed indicate that there is a bigger mine in the making there than now exists at Anyox in the well-known Hidden Creek Mine. It is reported in this connection that there is a strong probability that the smeltery at Grand Forks, which was recently closed down by the Granby Company, will be removed to Ecstall River. There has been no authoritative statement, however, to this effect.

The Queen, Nugget, Bonanza and Ore Hill Mines, situated in the Sheep Creek District, are being opened up and from the information available the showing generally are reassuring. Activity in this section, however, is not confined to these properties. Development is proceeding on a number of prospects and there has been a considerable influx of miners. An illustration of the extent of the recent improvement in conditions in this section is found in the reopening, after a period of two years idleness, of "The Half-Way House." This is situated on Sheep Creek, and is reported to be well patronized.

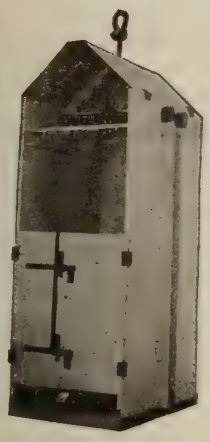
PRINCE OF WALES TO VISIT THE NORTH COUNTRY.

The Prince of Wales is to visit Cobalt on September 2nd, and will be escorted through one of the leading silver mines of the camp.

SAFETY MINE CAGES

MADE TO FIT YOUR SHAFT

We build these Cages to suit you and your workmen. They are Safe, Strong, and Reliable.



We guarantee the Safety Device of our Mine Cages to be quick and positive in its action. It can be relied on to work and to hold the cage safely at any time in case of accident. The springs are strong, the dogs are properly designed and adjusted, and the whole device is made amply strong for any emergency.

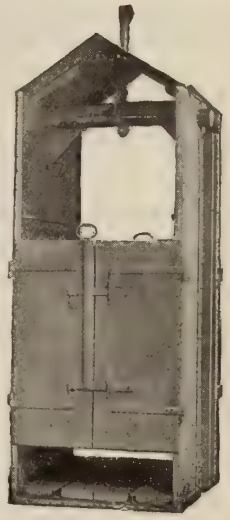
If you do your part by keeping the timbers in proper condition, and the bearings lubricated and reasonably free from rust, the Safety Device will do its work every time.

We supply these cages with either one or two sets of doors for inlet or exist, to suit your shaft.

Rails are also laid in the floor, if required, for convenience in handling the cars.

The top doors permit the carrying of long timbers, or the escape of the men in case of accident.

The hand rails are properly placed to safeguard the passengers in the quick ascent or descent.



HAVE YOU SEEN A COPY OF OUR NEW MINING CATALOGUE?
If not, drop us a card, and one will be sent at once.

MARSH ENGINEERING WORKS, LIMITED, Established 1846 **BELLEVILLE, ONTARIO**

Sales Agents: MUSSENS, LIMITED, Montreal, Toronto, Winnipeg and Vancouver

FOR SALE

2 Norwalk straight line three stage Compressors for charging air locomotives, having compound steam cylinders and two flywheels.

Air pressure 800 lbs. Steam pressure 110 lbs.
Size of steam cylinders—High pressure, 20 ins. diameter. Low pressure, 38 ins. diameter.
Stroke, 36 ins. diameter.
Size of air cylinders—23 ins., 16 ins., and 8 ins. in diameter.

ALSO THE FOLLOWING LOCOMOTIVES:—

Maker	Size	Description	Dia., Driver	No. Wheels	Wheel Base	Weight	Length Overall
2 Porter	7″ x 12″	Simple	23″	4	4′0″	14000	13′4″
4 Porter	10½″ x 14″	”	26″	4	5′3″	30000	19′4″
2 Porter	7″ x 14″	”	24″	4	5′3″	20000	18′0″
1 Baldwin	11″ x 14″	”	28″	6	6′6″	40000	22′8″
1 Baldwin	11″ x 14″	”	28″	6	6′5″	34000	19′8″
1 Baldwin	9″ x 14″	”	28″	4	5′6″	25000	17′0″

These locomotives are 3 ft. gauge and have a clearance height from top of rail of 4 ft. to 5 ft. 2 in.
This machinery is all in working order and is open to inspection at Glace Bay.

DOMINION COAL COMPANY Limited, Glace Bay, N.S.

This Trade Mark on Your Belting

"CAMEL HAIR" "CAMEL" BRAND BELTING

Guarantees satisfaction under Mining conditions, intense Heat or below ZERO. Wet or Dry, Steady or Intermittent. Will outlast from 4 to 6 Rubber Belts on Bucket elevators.

We also make Conveyor Belts, any width or thickness,

American Ore Reclamation Co.
71 BROADWAY, N.Y.

The owners of the Cane Silver Mines, situated in the township of Cane, in the Elk Lake district, have failed to conclude the proposed deal with Buffalo interests. The deal appeared to have fair chances of being consummated, but a last minute hitch occurred.

The Cane Silver Mines consists of about 120 acres on which a number of narrow veins containing patches of native silver have been found. The formation is diabase, and in no case has silver been found to continu eto more than a few feet below the surface.

Silver was first found on the property in the spring of 1913, and the claims have been explored in a small way intermittently during the last six years.

THE DERBYSHIRE (ENGLAND) OIL BORINGS.

The flow of oil at the Hardstoft bore has not appreciably increased, and it has been decided to instal a pump. A similar experience is expected at the other bores, and while the finding of oil is not by any means unimportant, no indications of a "gusher" of oil in quantity has yet been observed.

The question of a royalty on oil is being largely discussed in England. The Government is being urged to announce a reservation of oil to the Crown. The question of royalty on a flowing substance is rather a new one in England, and it raises a number of considerations of source, direction of travel, and support to adjoining properties which are not in question in connection with solid substances, such as for example, coal and ironstone.

ALBERTA COAL STATISTICS.

Some interesting figures have been compiled by John T. Stirling, chief inspector of mines for the Province of Alberta. They show the coal output for the province during 1918 and indicate its relation to Canada's total production. During that year, he points out, the consumption in coal was approximately 37,237,065 tons, of which 22,057,065 tons were imported from the United States, and of which total 2,559,041 tons were imported into Western Canada. In 1918 there were produced in the Province of Alberta 6,148,620 tons of coal, 100,470 tons of briquettes, 32,858 tons of coke, and 9,898 tons of shale for the manufacture of bricks. There were 7,687 tons of bricks sold. During the period in question 317 coal mines were in operation in Alberta, as well as two copper and two shale mines. Seventy new mines were opened, while nine old mines were reopened. Off-setting this to some extent there were 71 mines abandoned. To operate these mines an average of 2,633 persons were employed above ground and 6,144 below ground.

:-: EDITORIAL :-:

THE COBALT STRIKE.

Elsewhere in this issue will be found an editorial statement by the Montreal "Gazette" on the Cobalt strike. Two striking intimations are conveyed by this editorial. It is assumed that the Cobalt strikers felt convinced that the Minister of Labor favored a strike, and also that the necessity for a strike arose, not from intolerable industrial conditions, but from a desire to gain certain political ends. A graver accusation could scarcely be made against a member of the Government. It is admitted that "recognition" is the point of contention, and the strikers do not plead that wages were low or hours of labor too long. The Minister of Labor has characterised the mine operators as obdurate, and he has asserted the right of a trade union to be recognised by the employers concerned, but he has asserted an entirely new principle, namely that employers must recognise a given and selected union irrespective of its previous relations with employers and its record. This is stretching the privileges of unionism very far, and, if accepted, the effect of such a principle would give freedom of action to the trade union only and no freedom at all to the other party to the bargain. In these days it may seem heretical to advance the statement, but we believe that even an employer of labor has some rights.

The European Commission of the National Industrial Conference Board of New York, after an exhaustive study of the situation in Europe, has reported that "the solution of the worldwide unrest problem rests largely upon the separation of political and industrial issues."

That the Cobalt situation was not an industrial one is evidenced by the mutually satisfactory manner in which employers and mine-workers have adjusted their differences in the Porcupine District. There is a general belief at Cobalt that similar differences could have been compromised there had not the international union organizers succeeded in conveying to the mine-workers the feeling that the theory and propaganda of international unionism was favorably regarded in government circles, and when the "Gazette" puts forward the suggestion that the Cobalt strike is "the manifestation of a political movement of which we have already had evidence," it discovers the menace from which the "obduracy" of the Cobalt operators proceeds.

THE HAILEYBURY MINING SCHOOL.

The Haileybury Mining School, commencing September 2nd is furnishing a Mining Course for returned soldiers, particulars of which are contained in this issue. No commendation of such a policy is required, as it carries its own commendation.

As a concrete example of the new spirit that is moving in secondary and technical education in Canada the Haileybury Mining School is significant. This school would seem to typify the idea of "vocational training" in its most efficient form, as it will permit of instruction being given to young men and aspirants for higher positions in the mining trades while permitting them to follow their regular occupation. This is the only method by which really worth-while instruction can be given to ambitious young men and the subordinate officials in a mining district, and the Haileybury School is justified in receiving, as it has received and will doubtless continue to receive, the support of the local mining companies.

The instruction of the subordinate officials in mining districts has hitherto been lamentably poor in Canada, and the greatest reliance has been placed by aspirants for certificates upon correspondence courses. In their day these correspondence courses have been of invaluable service to men who could not obtain the benefits of college instruction, and their value will not be lessened, but rather increased by the provision of technical schools having the physical equipment for demonstration of the phenomena and problems mentioned in the text-books. But it is not right that ambitious mining men, who desire to rise in their profession, but are limited by occupational ties, by lack of money and remoteness from large centres of population, should be forced to rely entirely upon correspondence courses, or even upon provincial mining schools inadequately equipped with apparatus for demonstration.

The Provincial Government of Ontario is to be congratulated upon the Haileybury Mining School, which may well serve as an object lesson to other provinces of Canada. The writer could not help contrasting the fortunate situation of Haileybury, with its well-equipped Mining School, and its equally well-equipped High School adjoining, with Sydney, Nova Scotia, where with a resident population probably three times exceeding that of Haileybury, and a surrounding industrial population very much larger than is served by Haileybury, the attempt to provide a technical school, although several times made, has never succeeded. The

Cobalt District has one industry only. The Sydney District has many large and varied industries, but so far, the provision for vocational training and secondary education has been limited to the evening classes of the Technical Education Department, which do not provide adequate facilities, or opportunities in any measure commensurate with the magnitude of the industrial development of the district. No criticism is here intended of the work already accomplished by the Director of Technical Education. With the limited means at his disposal as much as possible, and probably more than could reasonably be expected, has been accomplished, but the whole conception of secondary education and vocational training needs to be enlarged.

CANADA'S COAL INSUFFICIENCY.—FURTHER REMARKS.

A leading article in "Toronto Saturday Night," dealing with the necessity to purchase coal at the present time, so as to stimulate production during the season of easy transportation conditions, and to avoid the autumnal rush, reviews the general world coal situation, and comes to the conclusion which has been consistently advocated by this Journal, and which no one can avoid who studies the subject, namely that there is a pronounced world coal shortage, particularly in Europe. In referring to Canada's ability to help, however, we think the writer does not do justice to our coal resources. The article states:

"All this goes to show that Europe is short of coal, and that the United States will be called upon to help out in making good the shortage. No opinion has been expressed as to the prospects for Canadian coal mines being called upon to help out. The only coal commercially available for such a purpose would probably be that which is being mined in Nova Scotia. This is a soft coal, only suitable for manufacturing and coking purposes, and it may be questioned whether it would be in general demand for the purposes for which coal is being drawn from the United States."

Canada is importing annually about sixteen million tons of bituminous coal and about six million tons of anthracite from the United States. We have no available anthracite in Canada, and even if we admit for the sake of argument that we must continue to import anthracite because of its greater suitabilities for domestic use than bituminous coal, yet there remains sixteen million tons of coal imported from the United States, which, considered on the grounds of quality only, could be furnished within our own borders.

But anthracite is not an irreplaceable substance, and there are many instances where Canadian-mined bituminous coal could be very advantageously substituted for anthracite.

There is no anthracite in Europe available for domestic uses, and if there were the people would be ignorant of how to use it. One Province of Canada at least gets along very nicely with "soft" coal, and many of its inhabitants would be puzzled to use "hard" coal. The truth is that anthracite is a convenient luxury, and it is suitable for use in large cities because of its smokeless character, but if we could not get it, we should speedily awaken to the possibilities of bituminous coal.

At least five million tons of the bituminous coal now being imported from the United States could and should be mined in Canada, and the declining or stationary condition of the Canadian coal-mining industry is a most serious matter.

After damning the possibilities of Canadian coal production with faint praise, and some rather cutting truths also, the writer of the article referred to says: "However, there is little to be gained from discussing the possibilities for the export of coal from Canada during the present juncture."

We differ. The questions of both the export and the import of coal in Canada will repay the fullest discussion and the greatest possible publicity. Canada could not only supply a much larger proportion of her own coal needs than is the case to-day, but could also export coal—and some day she will.

F. W. GRAY,

F. W. Gray, Associate Editor of the "Canadian Mining Journal," and Editor of "Iron & Steel of Canada," who has recently been appointed the Secretary of the Iron and Steel Section of the Canadian Mining Institute.

CORRESPONDENCE.

The Labor Situation at Cobalt.

To the Editor of the Canadian Mining Journal:

Sir,—An editorial in your issue of July 9th, entitled "Mining Profits and Wages," which is a misnomer, as far as the essential part of the editorial is concerned, imples a lack of understanding of the real situation in the Cobalt Camp.

The wages paid in Cobalt are, with few exceptions, as high as any paid on this continent. While a few of the larger mines could undoubtedly pay higher wages, the majority are living a hand to mouth existence. Higher wages necessitated a corresponding increase in the cost of all operations and works to the detriment of the district as a whole, and the demand for higher wages does not indicate any very constructive tendency on the part of the Union.

The cost of developing properties in Northern Ontario is a particularly costly one, and one of the chief reasons for the small number of properties now being developed is this big expense for the preliminary operations. This is one of the chief reasons why so many of the companies are looking to other fields where preliminary costs are much lower.

You state that the managers should accept the invitation of the Union to get together and that past history of the Union should not be allowed to stand in the way of such a conference. It is not only the past history with which the managers are dealing but with the present history, as well. The organization is the same now as in the past. The miners have, contrary to your implication, full opportunity to express their views and have seized each and every one of the many opportunities which have presented themselves to air them.

The present trouble is largely due to the avidity with which the Department of Labor has listened to complaints and encouraged the Union in its demands.

To the big majority of the mine workers, the rate of pay and hours of labor were quite satisfactory. Living conditions are good and conditions under which men work are of the best. The whole question is really one of recognition of the Union. The different mine managers have always been willing and pleased to meet and deal with a committee of the employees, but the Union felt that this was destroying its influence and opposed such conferences.

The fact that the men were getting a square deal without the Union interference was too bitter a pill to swallow without causing trouble and the old story of recognition of the Union was once more revived. There were no particular issues at stake, but the fact that the relations between the employee and employer were harmonious and the membership in the Union low, was sufficient excuse to "start something."

Unfortunately the Department of Labor, possibly actuated by a keen nose for votes, and notwithstanding that the mines were operating under one form of collective bargaining, tried to insist that the particular brand of collective bargaining advocated by it and which called for recognition of the Union, should be practiced.

To the average man it would seem that whatever the functions of the Minister of Labor may be, they are not to act as a propagandist for the Western Federation of Miners.

Yours, etc.,

ENGINEER.

Editorial Note.

[The writer of the above letter has misinterpreted some of the remarks made in the editorial referred to. His letter will, however, help our readers to understand the situation at Cobalt. We suggested that the mine managers and the Union should attempt to settle their differences in conference, and suggesed some of the reasons why miners should not expect too large a share of the profits of the few very profitable companies. Our correspondent seems to be under the impression that we were advocating the paying of higher wages. Our remarks were rather directed to the desirability of treating with the Union without putting too great stress on the past history of the Western Federation of Miners.

If we are correctly informed, the labor situation at Cobalt was very satisfactory when the Industrial Relations Commissions visited Cobalt a short time ago. Since then there have been many rumors of impending trouble. It would seem that the endeavors of the Government to find out whether there was dissatisfaction when there was none has aroused in the professional leaders a feeling that they were not doing their work well. They have since been very active in their endeavor to convince the Minister of Labor that the miners were not being fairly treated. Those who diligently look for trouble can find it or make it almost anywhere. If the searcher enlists the services of professional labor leaders he may reasonably expct to succeed in creating a state of unrest.

At Cobalt there have been many meetings between mine managers and their employees to discuss wages and conditions. The men have appointed committees to meet with the managers and there is little reason to doubt that there exists good feeling between the managers and employees at each mine. The present trouble is between the Union and the managers. The officials of the Union appear not to approve of collective bargaining unless the bargaining is conducted by them. Naturally the managers have other views.

If all the mine employees in the Cobalt district formed a Union and elected representatives. we would be strongly in favor of the question of wages being settled at conferences between such representatives and mine managers. Workers are interested in the wages not only at the mine at which they are employed, but at the other mines in the community in which they live. A standard wage for the district is desirable. The determination of such standard wages should be made by consultation between the representatives of all the workers in the district and the managers.

Unfortunately, there is at present no such organization among the mine employees. There is at Cobalt a branch of an International Union to which many of the man belong. Many of the mine employees do not belong to this Union and their views cannot properly be expressed by the Union officials. Moreover, the local Union is controlled in the United States, not in Cobalt. When the mine managers object to recognizing the leaders of the International Union or its local officers as the representatives of their employees, they are quite justified. The men do not properly represent the employees. If there is any need to argue the point we need simply refer to the fact that these professional leaders have called a strike when most of the workers appear not to believe conditions unsatisfactory.

While we do not believe in recognition of the Union as defined by Union leaders for the consumption of members and prospective members, we are nevertheless of the opinion that, since a considerable number of em-

ployees are satisfied to have their union officials represent them, the managers might well listen to the arguments of these officials. This is what we suggested in the editorial to which our correspondent objects. We have little doubt that if granted such an interview the Union officials would in their endeavor to increase membership say that it meant recognition as defined by them. Misrepresentation could, however, be to some extent prevented by giving full publicity as to the character of the conference.

While we urged that the operators should listen to what the union officials had to say, we do not believe that the strike for which those officials are responsible should be settled by conferences between the union officials and the mine managers. The employees of the mining companies have quit work. If they wish to return to work under the very good conditions which prevailed when they went out, they will doubtless take steps to get their views represented properly. How and when they will do it is for the workers to decide. A really representative committe of the workers would not be so much interested in members' fees as in work in the mines at good wages. If they and the mine managers can be brought together the strike will doubtless soon be settled, for wages and conditions at Cobalt are known to be good.—R.E.H.]

THE COBALT STRIKE.

The Minister of Labor has issued a statement or given an interview in which he attempts to defend his position in connection with the strike of miners, which has stopped production in the Cobalt mines. He would like people to believe that every effort was made to avert this strike, but that the mine-owners were obdurate. The principal issue in the Cobalt situation, the only one in regard to which no settlement seems possible, is the question of the recognition of the union in its affiliation with the Western Federation of Miners, represented on the ground by a gentleman of the name of McGuire. A Cobalt despatch to the Toronto Mail and Empire, a paper friendly to the Government, quotes Mr. McGuire as stating that the miners have the support of the Union Government, while "other members of the Miners' executive unhesitatingly state that the miners were told to strike by the Labor Minister."

The conduct of the Minister of Labor in regard to the Cobalt situation, is important, as illustrating his general attitude, and helps to explain why the Industrial Conference is being organized as an Organized Labor Conference. When the Royal Commission on Industrial Relations made its tour of the country last May, a visit was made to Cobalt, and a study made of conditions there. It was found that the operators had gone far in enabling the miners, by wage increases and by profit-sharing through the payment of bonuses based upon the price of silver, to meet the mounting cost of living. The Mayor of Cobalt, Mr. Malcolm McKinnon, in giving evidence before the Commission said, "As far as my knowledge of it goes, I would think there was very little unrest, if any, here. Every person seems to be well satisfied with the conditions here." One of the employers, described the camp as one of the most peaceful in which he had ever been. Another declared that the men on his proprty were perfectly satisfied. Representatives of the miners also testified, and the burden of their complaint was that the mine-owners would not treat with the miners' union. This the owners frankly admitted, stating that they would have nothing to do with the Western Federation of Miners because of its history. The Minister of Labor claims for the Western Federation of Miners that it has changed its ways, that the evils of its policy and leadership of ten years ago are not now to be charged against it. The Cobalt mine-owners, however, are unwilling to risk it. Has the Minister of Labor any guarantee that the constitution of this organization will protect it in the future against domination by men with criminal records or by men who have been deported from any country as undesirable citizens? This question of recognition, was, and is, the whole trouble between the employees and the mining companies at Cobalt. On the question of wages there is not sufficient disparity to preclude a settlement. Yet the Minister of Labor pretends that the strike could not be averted because of the "rather unfortunate" attitude of the employers. His position, then, is that although all other differences might have been composed without a strike, the men were justified in paralyzing the industry as a means of enforcing recognition of their union. If this is not a correct statement of his attitude, perhaps he will clear up any doubts by stating it himself. If we are right, the Minister approves of a strike on a purely political issue, and is prepared to sanction the crippling of industry in order to serve the political ends, not of labor, but of organized labor. His actions and his statement lead to, and permit, no other conclusion. However right that position may or may not be, from the standpoint of Mr. Robertson as a trades unionist, it is an impossible one for a member of the Government, who must be the servant of all the people, and not of any organized minority. Otherwise, government becomes impossible, and Sir Robert Borden, or whatever constitutionally selected Premier may be in office, gives place to comrade Robertson, or some other comrade. It is a serious situation, requiring from the Government consideration and action. It is the manifestation of a political movement of which we have already had evidence, and which will never be easier to restrain than it is now.—Montreal "Gazette."

PERSONAL.

George E. Leighton, the Canadian representative of the Hardy Patent Pick Company, of Sheffield, England, is shortly leaving for England.

I. C. MacKie, for a number of years Chief Chemist of the Dominion Iron & Steel Company, at Sydney, N.S., has been appointed Metallurgist to that company.

Alexander McEachern, for a number of years superintendent of No. 4 (Waterford) District of the Dominion Coal Company, and Alexander MacDonald, also for many years superintendent of No. 3 District, have been appointed as Assistant General Superintendents with residence and offices at Glace Bay.

Lt. H. G. Young, C.E., returned to Canada from overseas on July 15th, and is now at the Military Hospital at Ste. Anne de Bellevue.

Professor H. M. Tory, of the University of Alberta, is visiting in Montreal and Nova Scotia.

Mr. G. M. Ponton has accepted a temporary position as assistant secretary to the Canadian Trade Commission.

Mr. H. E. T. Haultain, professor of mining at the University of Toronto, is visiting copper mines in Michigan.

BULLETIN OF THE HAILEYBURY MINING SCHOOL COURSE FOR RETURNED SOLDIERS.

Under an arrangement with the Department of Soldiers Civil Re-establishment, the Haileybury Mining School offers courses to returned soldiers in the various subjects pertaining to mining. The school is well equipped to carry on classes in ore-dressing, assaying, chemistry, physics, mineralogy, geology, surveying, draughting, mining and mathematics.

Beginning September 2nd, 1919, special short courses will be given in the above subjects extending over periods of from six to twelve months.

At present there is not a vocational officer in this district. Men intending to take this course should write Mr. F. S. Drummond, D.V.O., Sudbury.

The standard of entrance required is the High School entrance examination. Those who have not passed this examination may consult with the Principal of the school so that each case will be dealt with individually.

Outline of Courses.

Mathematics.—The school is prepared to give courses in arithmetic, algebra, geometry and trigonometry from the beginning of the subject as far as the senior matriculation. The courses will be adapted to the needs of those taking the classes.

Surveying.—The course includes chaining, levelling, contouring, transit surveys, stadia surveys, shaft plumbing, mine surveying, and plotting.

(Only those who have completed at least the mathematics of the second year of the high school should attempt this course.)

Physics.—A brief laboratory and class room course in mechanics, heat and electricity.

Chemistry.—Some knowledge of chemistry is necessary in order to intelligently follow the work in mineralogy, assaying and ore-dressing. The course will cover an experimental study of some of the common elements and their compounds, chemical principles, formulae, equations and nomenclature.

A student who has already taken elementary chemistry may proceed with a course in qualitative and quantitative analysis of ores and minerals.

Mineralogy.—A laboratory course covering about sixty minerals, their physical properties and blowpipe tests. This subject is essential to those taking ore-dressing and assaying. A large collection is available for study.

Geology.—A field course dealing with the rock formation of the district. Also class-room work on rock classification and structure, ore deposits and prospecting.

Fire Assaying.—The equipment of the assay laboratory is similar to that of any commercial plant, and the course is carried out along practical lines. Attention is specially paid to the principles of the various operations. The course covers all methods of gold and silver assays, and the analyses of cyanide solutions.

Ore-Dressing.—The ore-dressing plant is among the best in Canada, and probably excels that of any other educational institution in the country. It is equipped to carry on complete tests in the crushing, concentration, cyanidation and flotation of gold and sidver ores. A detailed course in each of these operations will be given.

Mining.—The development of an ore body by means of shafts, drifts, cross-cuts, up-raises and winzes, diamond-drilling. Plan of surface lay-out for a small mine.

Mechanical.—Freehand sketching.

Draughting.—Machine parts, lettering, drawings to scale of machine parts and tracings of the same. Design of simple equipment.

CANADA'S COAL OUTPUT.

Production For May and Imports of Anthracite Below May, 1918.

The Dominion Bureau of Statistics issues the following monthly bulletin as a survey of the output of coal in Canada for May, 1919, as compared with May, 1918.

In addition the imports of bituminous coal for May, 1919, were 736,426 whereas May, 1918, shows 1,437,377. The imports of anthracite coal for May, 1919, were 461,701, and May, 1918, 465,561.

	Output for month of May, 1918. Net tons.	Output for month of May, 1919. Net tons.
Sydney	375,120	288,468
Inverness	20,385	11,059
Port Hood	153	576
Pictou	47,009	43,305
Springhill	46,730	43,351
Joggins	20,180	17,074
Total for Nova Scotia	509,577	403,833
New Brunswick	23,209	11,090
Saskatchewan	21,479	17,819
Alberta bituminous	255,462	187,304
Alberta anthracite	12,141	0
Total for Alberta lignite	144,602	93,695
Grand total for Alberta	412,205	280,999
Crow's Nest	77,819	49,201
Inland	12,711	6,041

Total for British Columbia	251,519	192,795
Grand total for Canada	1,217,989	906,536

CHICAGO MEETING OF THE AMERICAN INSTITUTE OF MINING AND METALLURGICAL ENGINEERS.

September 22 to 26 is the time set for the Chicago meeting of the A. I. M. M. E., at which the progress that has been recently made in technical lines will be fully discussed. Among the subjects to receive particular attention will be the iron and steel industry, which has reached such importance in Chicago. It is planned during the meeting for the Institute to make an excursion as a body to Gary, Indiana. Arrangements are being made to charter a steamer which will convey the members and guests across the south end of Lake Michigan, directly to the steel works. A tour will be made through the various departments of the steel plant, and luncheon will be served at Gary. Technical sessions on subjects in ferrous metallurgy will be held on the boat.

The banquet has been scheduled for the evening of Wednesday, the twenty-fourth, at the Congress Hotel. By putting this function in the middle of the week, it is expected that a maximum attendance can be obtained; members able to come for only a portion of the session can then be present at the banquet whether they come for the first or latter part of the week.

An elaborate programme for the entertainment of the ladies is being prepared, and all members are urged to bring their wives to this meeting.

THE CALGARY INDUSTRIAL CONGRESS.

The demand for a foreign trade commission to represent the western provinces of Canada, exclusively, organization from ocean to ocean in many special adment Association and urged by the president of that organization fro mocean to ocean in many special addresses before public bodies, seems now to be certain of ultimate fulfillment, if one may judge by advices received at the headquarters of the Canadian Industrial Congress, August 11-16, from many sources.

Advices to this effect are received from Winnipeg, from Vancouver and even from Ottawa, and it is now apparent that many of the members of the Dominion Government look with favor on the idea.

The proposal for a foreign trade commission for the West was originated by Mayor M. A. Brown of Medicine Hat, president of the Alberta Industrial Association. It is based on the belief that only by a proper investigation of the foreign markets for Western Canadian products can the West build up industry to its maximum. Such an investigation, it is explained by Mayor Brown, would deal specifically with those possible markets for Canadian products lying on and adjacent to Pacific Ocean routes of traffic and the vast undeveloped Oriental marts.

Mayor Brown holds to the belief that eventually Western Canada will some day be manufacturing on a larger scale than Eastern Canada because of the great potentialities in this connection in China and Japan as well as along the western coast of South America and in Australia.

"The world does not realize," Mr. Brown points out, "that one-seventh of the population of the globe is living and striving and working along the banks of one river alone in China. The possibility of the development of this wonderful market is just one aspect of the great trade which Western Canada and the western portion of the United States will have the great opportunity to deal with.

"Great economists of the day, men with vision, see the development of the Pacific regions as the most striking aspect of the future of our continent. I may add that by Pacific regions I include those inland empires such as our own, Alberta, Canada."

Strong support is being given the project for a Western foreign trade commission especially in Vancouver, B. C., Victoria, B. C., Seattle, Portland, and other western cities more easterly, such as Winnipeg, Regina and Saskatoon. All these cities will be represented by good delegations at the forthcoming Industrial Congress, to be held in Alberta in August. The principal or "educational" sessions of this congress will be held at Calgary, Canada, August 13 and 14. The industrial men of the continent are being asked to participate.

That this is assuming a phase of international importance seems certain from the fact that already a large number of the chambers of commerce of the United States are planning on having delegations in attendance, as well as the city councils and municipalities themselves of many of the more important Western cities.

From as far east as Erie, Penn., and as far south as Florida, assurances are given that representation will be made at the congress, while from Minenapolis and other northern United States cities large delegations will come. From Minneapolis it is possible that a special train will be arranged as very many of the industrial leaders of Minnesota are planning to be present.

A special representation is coming to the congress from Japan and this delegation will be accompanied by delegates from the Japanese Club of Seattle and a corresponding organization from San Francisco. It is possible that a Japanese speaker will be on the program for at least a brief address bearing on the relations as between Japan on the one hand and the United States and Canada on the other.

TESTING NEW ELECTRICAL PROCESS FOR SMELTING.

A test, which is causing considerable interest, is now being made to prove the commercial possibilities of smelting magnetite ore in British Columbia.

On July 9th Mr. J. H. Fraser, managing director for the Vancouver Magnetite Iron & Steel Smelting Company, owners of the Ronaldsay Howe Sound Pig-Iron Smelting Plant, obtained from the B. C. Electric Company, the use of the old power plant at Highland Station for the purpose of carrying out full tests of the Fleet process of smelting magnetite.

The Provincial Government is doing everything possible to encourage the development of the iron industry in British Columbia and has granted $2.000 to carry out the test and has shipped 50 tons of Texada Island ore are to be used. In addition to this the Provincial Government has agreed to pay a bonus of $3 a ton for all iron smelted in British Columbia from British Columbia properties.

Mr. Fleet declares that, by his process, which is electrical he can produce magnetite pig iron at from $11 to $13 a ton, this being considerably less than the oil and coke method used at the Ronaldsay plant which costs $22.

Should the Fleet process prove satisfactory a full plant will be erected and the pig iron then handled through the Ronaldsay smelter where it can be transformed by the oil process into the best of steel. This would place Vancouver on better than a level with iron and steel industries of the East, and will help to continue on the Pacific Coast the industry of steel shipbuilding.

Mr. W. D. Fleet, of Montreal, the inventor of the process is a well known authority in electrical matters. He was superintendent of the Canadian Copper Smelting Company at Sudbury for six years and later installed the electrical apparatus in the big hydro-electrical plant of the Calgary Power Company at Kananaskis and Horseshoe Falls. From Alberta he went to Manitoba, where he was on the Manitoba public utilities commission. His process, which is now being tested on the iron ores of British Columbia took three years of experiment and study and is declared by men who understand smelting to be a successful one.

THE YUKON.

Recently the steamer Dawson sailed for Mayo to tow the big dredge from McQuesten to Mayo, where it is to be knocked down and transferred to Highest Creek. It will there work out several miles of placer ground. L. H. Titus goes to Mayo to look after the transfer. He is manager of the new company recently formed to operate the dredge.

The Use of Explosives in Mines*

By H. Y. RUSSEL, Manager, Technical Division
Canadian Explosives, Ltd.

Probably it would be well at the outset to give a brief outline of the manufacture of explosives, as, in all probability, except by those directly engaged in their manufacture, less is known about the processes involved than about the manufacture of any other commercial product. This is not altogether due to the fact that any great secrecy is made of the processes, but rather because they are unusually hazardous and it is not desirable to expose more people than necessary to the dangers entailed. Consequently it is not the practice of explosive manufacturers to show people not directly connected with the industry through their plants. We believe, also, that it is the general opinion of the average layman that explosives are all the result of some chance discovery rather than the outcome of scientific investigations and calculations. The explosive chemist does not, ordinarily, accidently develop or discover new compounds which are explosives. Rather, he sets out to manufacture a theoretical compound which he knows will be explosive, and what he discovers or invents is a commercial process for the manufacture of the compound desired. Practically all explosives are and have been formulated on paper and many of their characteristics determined by calculations before any of the actual explosives have ever been made. For this reason all up-to-date companies manufacturing explosives have large staffs of specially trained chemists whose duties are to continually test the raw materials that go into the explosive, the mixture of these ingredients as the process of manufacture develops, and the completed article.

The raw materials that go into the manufacture of explosives must be of a high commercial grade. They are bought upon certain standard specifications and, when received, they are tested under the supervision of the chemical division before being used.

The first step in manufacture is the examination and mixing of the "dope," or the material which absorbs and holds the nitro-glycerine or the liquid explosive base. The composition of the "dope" varies in different explosives, but it consists generally of soda. The constituent materials, whatever they may be, are first screened to remove any foreign bodies, and samples are sent to the chemical laboratory for analysis. If the necessary degree of purity is found, the materials go forward for manufacture; if not, they are rejected and properly purified, or if that is not possible they are discarded.

Each lot of satisfactory material is then thoroughly dried, to get rid of the excess moisture and afterwards grained and screened to insure each ingredient having its proper degree of fineness. These operations are of great importance, as any excess of moisture will have a very bad effect on the explosive, making it insensitive and apt to leak, while the screening not only removes small foreign bodies, such as pieces of stone, iron and steel, which would be a source of danger in subsequent operations, but the size to which the article is ground has a marked effect on the quality of the completed explosive. Samples of the dried and screened materials are tested by the chemists, and if satisfactory the different ingredients, with the exception of liquids, are put together in the proportions called for by the formula for the particular grade to be manufactured, and are run through a mixing machine which thoroughly mixes and then again screens them. The result is known as the "dope." This screening checks the first one and also removes any foreign matter that may accidentally have got into the ingredients since the preliminary screening.

Samples of the dope are sent to the chemical laboratory in order that the proper incorporation of the different ingredients may be checked and analysis are made to prove that the proper proportions of the different ingredients have been used.

The dope is now ready for mixing with the nitro-glycerine, or the liquid explosive. Each is carefully weighed to insure proper proportions being used, the dope again screened and put into the mixing machine first, the nitro-glycerine being added and the apparatus started up and run until a thorough mixing is accomplished. This completes the making of the explosive, and again the chemist checks up the results.

The explosives are then conveyed to the packing machines for punching into the paper shells. Different kinds of punching machines are used for nitro-glycerine and ammonia dynamites, and for gelatines (forcites). These machines are controlled as to the force of the punch they deliver and in this way the density of the cartridge and the number of cartridges to the case is largely determined and kept constant. This is checked every half hour or so by weighing several cartridges, so that any variation in the density will be caught and the machine adjusted if necessary.

At times it is a rather difficult problem to maintain a constant density, as some of the ingredients vary considerably in this regard. This is particularly noticeable in ammonium nitrate, which is used extensively in Permitted Explosives for coal mines, so that extra care has to be exercised in making up these explosives.

In calculating the formula for an explosive, particularly one for use in mining, where noxious fumes must be at a minimum, allowances of the oxygen-producing ingredients is made to cover the fume produced, even to the combustion of the waxed paper shell, and samples of the completed cartridges are sent to the works laboratory for final testing.

The packed shells, which are now called cartridges or sticks, are conveyed to the packing house. Those powders containing nitrate of ammonia, which is very hygroscopic, are dipped in a waterproofing compound in order to increase their water resisting keeping qualities. The cartridges are then packed in the cases and weighed, and, in order to again check the density, the cartridges in every tenth or twentieth case are counted and the number required to make the net 50 lb. checked. Both during the punching and packing processes extreme care is taken to throw out all defective cartridges, which consist of torn shells or those partially filled. However, even though the cartridges receive two handlings, it is almost impossible to insure against some cases containing a poorly packed cartridge here and there.

* Paper presented at the Annual Meeting of the Canadian Mining Institute in March, 1919.

Before nailing the case, the packer inserts a slip bearing his number for reference purposes in case of complaints. It is thus possible when complaints are accompanied by the packing slips, to trace the defect back to the packer. Besides the packer's slips the cases are marked on the outside with the month and year in which they were packed.

The analysis made at the laboratory is checked against the theoretical composition. Balistic pendulum and mortar tests are made for strength, and centrifugal tests for exhaustion. Sensitive tests are also made. Samples are also placed in our magazines to be watched to see that the explosive will stand storage.

From the packing house the cases are taken to the magazine and stored ready for shipment. The magazines are so built as to insure their being dry and well ventilated, and stocks are piled so that oldest will be shipped first.

All through the process of manufacture extreme care is taken in the handling of the materials and of the finished product to avoid the introduction of any foreign material, and the motto of the explosive manufacturer is that "Cleanliness is next to Godliness." This extreme care is also necessary in order to reduce the possibilities of accidental explosion. Among the precautions taken may be mentioned the elimination, wherever possible, of all metal parts for containers and apparatus; where this is not possible, brass, bronze, or monel metal is used. All workmen are required to wear rubber-soled shoes, and are not allowed to wear any clothes having metal or bone buttons; nor are they permitted to have in their possession matches, jack knives, or any metal whatever. Employees are frequently searched during work to make sure these regulations are being obeyed, and any infraction means dismissal.

Rules are posted in every building, regulating the quantity of explosives permitted in that building at one time, the number of operators allowed, the methods of operating, the kind and number of tools permitted, and citing the necessary precautions to be taken to minimize the chance of accident.

As a safety precaution, the manufacture of explosives is carried out in several stages, each in its own house, and separated from the other buildings by a distance of 300 ft., each building being barricaded by mounds of earth extending up to the eaves of the building. These mounds are to prevent the lateral projection of missiles in case of an explosion in any of the individual buildings.

The above broad description of the manufacture of explosives will indicate the care and the safety precautions that are taken and also the very important part played by the staff of chemists who check up the different processes. To operate an explosive factory without chemists would be as impossible as to operate a mine and mill without assayers or assays.

The explosives discussed in this paper are those in which the explosive base consists of nitro-glycerine, nitro-glycerine in combination with gun cotton, or nitro-glycerine in combination with ammonium nitrate. They are known as "high explosives" as distinct from blasting powders or low explosives.

It was not many years ago that users of explosives had a very limited variety to choose from; in fact blasting powder and one or two grades of N.G. dynamite covered the production. As to some of the old dynamites, anyone using them now would think they were going through a gas attack in which there were a considerable number of duds. The improvements in high explosives have been many, but they have been gradual, and they are due to the knowledge and ability of specially trained men. New explosive ingredients have been discovered, which, when added to nitro-glycerine, result in better and safer explosives, and the different steps in the manufacture are now under the supervision of experts, so that the finished product to-day is one that can be depended on for constant strength and reliability.

In the manufacture of high explosives, and in making improvements in explosives or producing new explosives, the main points to be considered are, safety in use, strength, adaptability for certain kinds of work, stability, and cost.

The danger in the use of explosives is due to their liability to premature explosion owing to receiving a sharp blow or shock; to leaking of nitro-glycerine owing to the use of improper absorbents or to exposure to moisture; to too high a thawing temperature; to defects in manufacture; or to getting on fire and then exploding.

To lessen the liability of danger from handling, ingredients other than nitro-glycerine are mixed with the N.G. and the result is an explosive of equal strength, but less sensitive to shock or fire. At the same time care must be taken that the sensitiveness is not so far reduced that the whole charge will not explode, thereby unexploded powder in the drill holes or chamber.

In the case of straight nitro-glycerine dynamites, the marked strength shows the percentage of nitro-glycerine contained. Thus a 40% N.G. dynamite contains 40% by weight of nitro-glycerine; a 50% N.G. dynamite contains 50% N.G., and so on. With gelatines, such as forcite, and with ammonia dynamites, on the other hand, the marked strengths do not mean that they contain the marked amount of N.G., but that other explosive ingredients have been associated with N.G. in such quantities that, when used in similar weights, these explosives develop the same energy as an equivalent grade of straight dynamite, though with different velocities of detonation, etc., which make them better than straight dynamites under certain conditions.

The relative "stability" of an explosive depends upon its ability to stand storage for a reasonable length of time without inclining to spontaneous combustion, losing strength, or otherwise deteriorating.

The principal explosives used in Canada to-day are nitro-glycerine dynamite; forcite (a gelatine dynamite); and ammonia dynamite. In the first the main explosive force is nitroglycerine alone; in forcite, it is nitro-glycerine and gun cotton, and in ammonia dynamite it is nitro-glycerine and ammonium nitrate. Before the war, explosives of the chlorate and nitro starch classes were manufactured in Canada. These explosives were used to a certain extent, though they are not so strong as the higher grades of dynamite, forcite or ammonia dynamite.

N.G. dynamites, forcite and ammonia dynamite are made in two varieties, "straight" and "low freezing" or "polar." Nitro-glycerine explosives of the "straight" variety, whether N.G. dynamite, forcite or ammonia dynamite, will begin to freeze at about 45 deg. F. To overcome this as far as possible, "polar" explosives are made. In polar N.G. dynamite the freezing point is lowered about 15 deg., so that it will begin to freeze at about the same temperature as water does. In polar forcite and polar ammonias the freezing point is lowered about 35 deg. The strength of the polar grades is the same as that of the straight grades. The exact

freezing point of polar explosives is uncertain and liable to variation. They have been used without thawing on open work where the temperature ran from zero to 6 deg. below zero for several days, they are known to have remained thawed after being exposed to a temperature of 10 deg. to 15 deg. below zero for over a week. again, they have been found frozen at a temperature of 8 deg. to 10 deg. above zero. From our experience in Canada we believe they will stand a temperature of from 10 deg. to 15 deg. above zero before freezing. and I could quote several cases where they have been soft, and were used without thawing, after exposure for several days to a temperature below zero.

The advantages of a polar explosive in the spring, autumn and winter are apparent for either mining or outside work. Their use does away with the necessity of thawing during five months of the year, when straight explosives have to be thawed. Almost anywhere in Canada polar explosives need not be thawed before the middle of November, nor after the middle of March, while with a straight explosive thawing should begin about the first of September and continue until the end of May, on account of the cold nights. Again, in some mines the underground temperatures are below 45 deg. F., and straight explosives will chill and freeze if kept there any length of time, with the liability, if used in this condition, of missed holes, burned holes, or partially exploded charges, which are both dangerous and expensive. Such powder must be returned to the thaw house and re-thawed. This does not happen with polar explosives. When polar explosives do freeze, however, they must be thawed in the same way as straight explosives.

While commercial high explosives of one kind or another are made in strengths of from 10 per cent to 100 per cent, there are certain limits which govern different forms. These limits may be due either to railway shipping regulations or to the impossibility of manufacturing a satisfactory explosive above or below certain strengths. High explosives of less than 17 per cent strength are known as "lifting powder," "railroad powder" (R.R.P.), or "Judson powder," and are used almost entirely in railway construction for large blasts.

Nitro-glycerine dynamite is made in strengths of from 17 per cent to 75 per cent, and is put up in cartridges 8 in. to 36 in. long and from 7/8 in. to 5 in. diameter. Forcite (gelatine dynamite) is made in strengths of from 35% to 85%, in cartridges 8 in. or 16 in. long and from 1 in. to 5 in. diameter. Ammonia dynamites are made in strengths of from 30% to 60%, in cartridges from 8 in. to 16 in. long and from 7/8 in. to 5 in. diameter.

While cartridges of the above lengths and diameters are made, the Bureau of Safe Transportation of Explosives places certain restrictions on the size of cartridges and percentage of nitro glycerine allowed to be shipped by freight. No explosive (except a gelatinized one) containing over 60% N.G. can be shipped by freight, also, explosives containing over 10% N.G. (except gelatinized explosives) can not be shipped by freight in cartridges more than 8 in. long and 4 in. diameter. The reason gelatinized explosives are excepted is that they are not so liable to leak or to be exploded by shock as are the other brands.

High explosives are graded with a 10 per cent difference in explosive content, as, 30 per cent, 40 per cent, 50 per cent and 60 per cent, and this grading has proved satisfactory to users of explosives. During war time the Canadian Explosives, Limited, at the request of the Government, in order to conserve raw materials and to assist customers to reduce costs, offered to make 35 per cent, 45 per cent and 55 per cent strengths. These were tried out quite extensively in some of the mines, in certain cass they were successful and are still used.

The energy developed by an explosive depends on the amount of gas liberated on explosion and on the temperature of the gas. The work done depends, in addition to the above, on the velocity of detonation, or the quickness with which the gas is liberated. Speaking broadly, the higher the velocity of detonation the more shattering effect an explosive has, and the lower the velocity of detonation the more heaving and less shattering the results. Considering equal grades, N.G. dynamite, on account of its high velocity of detonation, is the most shattering of the commercial explosives; then come ammonia dynamites, then gelatine dynamites or forcites. Velocity tests are made in the open as there is no way to make such tests with the explosive confined, as in a drill hole.

The tendency of users of explosives in Canada today, particularly in mining, is to use the lowest strength explosive that will break their ground when it is properly drilled. Up till a few years ago considerable amounts of "gelignite" (a 75 per cent N.G. explosive) were used in the mines in Porcupine, Cobalt and British Columbia, but this has been replaced by 60 per cent, and often 50 per cent, explosives and a lowering of costs has followed. To-day by far the largest proportion of high explosives used in the mines of Canada is of 40 per cent strength, while little 60 per cent is used. This is due not only to the more careful supervision given to the use of explosives, but also to the fact that greater care is taken to see that the drilling is done properly.

In choosing an explosive for mining work the following considerations are important: Safety in use, breaking strength, minimum of injurious fume and smoke, and stability. It is also of advantage to use one kind and strength of explosive throughout the mine. After these considerations come points such as nonfreezing, plasticity (which allows the explosive to "stay put" in a hole, filling it completely when tamped, so that it does not run out of an upper when the cartridges paper is split), and cost.

Until such time as the Dominion Government, establishes a Department of Explosives with a testing station, the best a user of explosives can do towards deciding as to the safety or otherwise of an explosive is to take into consideration the standing of the company manufacturing the article from which standing he must judge how much weight can be attached to their assertion that the explosive is as safe to handle as it is possible to make it, and still have it explode when wanted.

In England there is a list of "Authorized Explosives," that is, explosives which are authorized by the Home Office for use in work outside of coal mines; but in Canada this procedure has not as yet been followed, and the permission of the mine officials to test an explosive in any working rests mainly on the standing and reputation of the firm of manufacturers and the persuasiveness of the company's representative. A few facts, however, can be borne in mind. A gelatine dynamite, such as forcite, will give off less fume and smoke than either a nitro-glycerine dynamite or an ammonia dynamite. Moreover, being denser, more of it can be tamped into the bottom of the holes

where the main work is to be done, and it will stand water and storage better than either of the other two.

Nitro-glycerine dynamite will shatter the rock more than the other two, and if there is a large amount of sand blasting or bull-dozing to be done, on account of not being able to pop-hole the large rocks, it is sometimes worth while to use it and have sufficient ventilation to take away the fumes.

Ammonia dynamites are more gassy than forcite, but are cheaper and run more sticks to the case. They are worthy of consideration in a dry mine with good ventilation.

To test an explosive for breaking strength, fume, and smoke, a good deal of trouble and at times some expense must be incurred, but both the trouble and the expense are very minor considerations if it is proved that the costs can be reduced and accidents prevented.

It is generally considered that in drifting, the ground is more difficult to break than in stoping, so that an explosive which will pull the drift rounds will be satisfactory in a stope. It is also more easy to judge the fume and smoke after a blast in a drift than in a stope, as the gases have not the same chance to get away. An average drift, therefore, should be chosen for the test, and the best machine men in the mine should be used to drill the rounds for testing the explosive. The standard round for the mine should be used and an official should examine each round before it is loaded, and note whether it is properly drilled or not, for it is evident that if a poorly drilled round breaks well, too strong and, therefore, too expensive an explosive is being used; while if the break is a poor one a notation that the round was poorly drilled may prevent the proper explosive from being condemned. A test of this kind should last from one to four weeks. The distance driven should be carefully measured and the cost of explosives per foot advance figured out and compared with past records.

Testing for fume and smoke is usually done by entering the drift a reasonable, and sometimes an unreasonable, time after blasting, and seeing how close to the the face one can get before the gas becomes too bad. This is neither comfortable nor safe. The best way is to enter the drift protected by a gas mask, and take samples of the air at various distances from the face, and have them analyzed for injurious fumes. During the test care should be taken that the same ventilation is operating under the same conditions after each round of the test.

It should also be the duty of some official to see that the explosive is well thawed when used, that a careful record is kept of the amount used, and that the holes are well tamped. An explosive which is successful in a drift test can then be tested in stoping, and if satisfactory can be used throughout the mine, with the knowledge that the best and most economical explosive has been adopted.

Stability, which is the quality of standing storage in good magazines, as well as a reasonable temperature in a thaw house, without leaking or deteriorating, can be checked as the test goes on.

Opening or developing a mine is done through a shaft or adit, and for this work a stronger explosive should be used than is necessary when a large amount of stoping is done. Not only are shaft rounds particularly hard to pull, but the speed with which the mine has to be opened up makes a strong explosive advisable.

When the percentage of explosives used in stoping is much larger than that used in drifting or sinking, a poor drifting or sinking round may be overlooked rather than use two grades of explosives; but when speed is a large factor it is expensive and annoying to have badly broken rounds.

To use explosives economically, the following points must be carefully watched:

The explosive must be well thawed, not only before it goes into the mine, but when it is loaded into the holes.

Use strong blasting caps. The stronger the cap, the better and quicker the charge is exploded. More work is done, and slight defects, such as insensitiveness, due to chilling, freezing, or long storage, are overcome with a No. 8 cap much more than with a No. 6. While a No. 8 cap is more expensive than a No. 6, it contains double the detonating charge. In lead block tests the No. 6 shows an expansion of 755%, the No. 8 of 1,215%; or, when detonated in the lead block, the No. 6 enlarges the cavity from 2 c.c. to 17.1 c.c., the No. 8 from 2 c.c. to 26.3 c.c.

The explosive should be well tamped. At least one foot of stemming should be used; two feet is better.

All loading and blasting should be done by a blaster or a blasting crew.

Uusing frozen or insufficiently thawed explosive is not only wasteful, but dangerous, as not only does powder in this condition do from 15% to 50% less work than it should, but missed holes occur and unexploded power is found in the bottom of the holes; both are a source of danger, the last especially.

When re-blasting is necessary it means, in most cases, either that the wrong kind of a round is being drilled; or that the round is improperly drilled; or that the wrong kind or grade of explosive is being used. Occasionally change of the rock is the cause, but the above-mentioned reasons apply in a great majority of cases.

Re-blasting old holes is very wasteful, the holes are enlarged at the top, and the rock is more or less cracked and shattered. It is frequently not much better than sand blasting or bull-dozing. If a close watch of the explosive consumption is kept at a mine which does much re-blasting, it will be found that from 15% to 20% of the explosive used in drifting goes for this work.

The use of good stemming will considerably increase the work done by explosives, and I think it is not too much to say that in mining work the increase would be 15%. In other words, the load in a hole can be reduced from 7 sticks to 6 if good stemming is used. With 40% forcite and $25.00 per 100 lb. this is equivalent to a saving of over 3 cents per lb.

While many of the larger mines have blasting crews it is rarely that a special blaster is thought worth while at the smaller ones. This I think is a mistake. When this paper was written (December, 1918) the price of 40% forcite at the mills was $25 per 100 lb. in carload lots of 360 cases or over. This figures out at 15 cents a stick. A mine could afford to pay a blaster $100 a month if he could save 30 sticks of powder a day, and at the same time there would be an actual saving in costs.

The economical use of explosives is one of the questions that is occupying the attention of every mine manager. The field is a large one, and the time allowed for a paper does not permit going into too much detail. The writer, therefore, has thought best to bring up the points that one meets in every-day mining, and where any saving that can be made is tremendous when spread through the industry.

Special Correspondence

BRITISH COLUMBIA.

New Ore Treatment Rate Schedule at Trail, B.C.

Reference has been made to the dissatisfaction of the independent shippers of British Columbia with the treatment charges of the Canadian Consolidated Mining & Smelting Co. at its Trail Smeltery as set out in what is known as Schedule B. This, it will be recalled, led to an investigation by a special committee having authority from the Dominion Government, the report of which was issued a short time ago. The matter was discussed at a recent Mining Convention at Nelson, when it was announced by J. J. Warren, the company's General Manager, that a new schedule was being prepared and would be issued shortly. That schedule, Schedule C, now has been published and is effective. It provides the promised reduction in ore treatment rates and more especially affects those ores containing percentages of zinc and sulphur. The schedule is as follows, the introductory table being the basis of payment for silver and lead:

	Silver Payment.	Lead Payment.
10% zinc or under.	95%	90%
Over 10% and including 11%	94½	89
" 11 " 12	94	88
" 12 " 13	93½	87
" 13 " 14	93	86
" 14 " 15	92½	85
" 15 " 16	92	84
" 16 " 17	91½	83
" 17 " 18	91	82
" 18 " 19	90½	81
" 19 " 20	90	80
" 20 " 21	89½	79
" 21 " 22	89	78
" 22 " 23	88½	77
" 23 " 24	88	76
" 24 " 25	87½	75

Silver:—Will be paid for the extent shown by the above schedule on the fire assay at the average of the Engineering and Mining Journal, New York, quotations succeeding the date of sampling at Tadnac, B.C. In no case will the deduction from the silver assay be less than one-half (.5) oz. per ton.

Leads—The lead contents will be determined by the wet method of analysis deducting one and one-half units to arrive at the dry lead assay. Lead will be accounted for on the dry lead assay to the extent shown by the above schedule; provided, however, that in no case will the deduction from the said dry lead assay be less than one unit or twenty pounds per dry ton of ore.

The price for lead to be used in settlement will be our sales price delivered at destination in Canada less one and one-half cents per pound for refining and marketing as now in effect under the existing pooling scheme, which will be continued. There will be deducted also from the delivered sales price, $2.30 per ton on sales at Toronto and common points and $4.50 at Montreal and common points and similar differentials to other points. This freight adjustment is to cover actual increases in freights, e.g., should sales in any month be 2,000 tons and say 1,200 tons for delivery at Toronto and 800 tons at Montreal, the freight adjustment would be 3-5ths at $2.30 and 2-5ths at $4.50, or $3.18 per ton of lead.

The pooling scheme is outlined as follows:

(a) Settlement is based upon sales price as above provided and only to the extent of actual sales from month to month.

(b) Whenever sales are sufficient to settle for a full month's lead receipts this is done promptly.

(c) Lead from our own mines is pooled with that purchased from others, and is treated in exactly the same way.

(d) Each month a statement is issued showing the condition of the pool. All shippers have been sent a copy of the last one issued.

Deductions.

Smelting per dry ton of material nine dollars and fifty cents as a base rate, which will be modified in accordance with the following formula:

(1) Add to the base rate per ton, 60 cents per unit for all zinc contained.

(2) Deduct from this result the total units of silica, iron, manganese, lime and magnesia at nine cents per unit.

Provided that in no case shall said base rate be reduced more than $4 per ton as the net result of the said additions and deductions.

Provided also, that in making the above computation, iron, silica and lime if 1% or under, and manganese and magnesia if 3% or under, will be disregarded.

Sulphur:—A charge will be made in addition to the above for all sulphur contained in excess of two per cent. at thirty cents per unit per dry ton of material, provided that such charge shall not exceed three dollars per ton in any case.

Moisture:—A minimum moisture deduction of ¼% will be made. The following penalty for moisture will apply to fine concentrates and clayey ore only.

If over five per cent, charge for all contents at ten cents per dry ton per unit.

Size:—Coarse and fine concentrates and ores should be shipped separately. If mixed so that over 30% will pass through a ¼ inch screen, an extra charge of fifty cents per ton will be made.

Sampling:—If the shipment is less than a car lot or contains more than one lot per car, a deduction may be made for extra sampling, assaying, etc., of $10 per lot.

Weights and Samples:—To be used in settlement shall be those made at the smelter.

Representation:—Shippers are expected to notify us as to who will represent them while their shipments are being weighed and sampled. Failure to do so will be constructed as meaning that the smelter will have authority to appoint one of the local mine representatives at the shipper's expense unless the local shiper notifies us that a representative is not required.

Assays:—Shippers will supply the smelter with their assays on smelter pulps shortly after sampling. In case of difference in assays requiring it, the umpire pulp will be referred to an umpire mutually agreeable. The party whose result is farthest from the umpire's result, will pay his fee.

Settlement:—(a) Shortly after sampling an advance payment of 90 per cent of the apparent value is made. The prices used in estimating the apparent value will be the New York price for silver and the Montreal price for lead of the date of sampling.

(b) When final settlement is rendered possible by silver quotations being available for the second calendar month after sampling and by all of the lead received during the calendar month in which the ore is sampled, having been sold, the final value will be computed and any adjustment necessary will be made between the smelter and mine.

(c) Advances made on account will be carried by the smelter without interest until the last day of the second calendar month in which the ore arrives. Interest at 6% will be charged on advances upon lead after that date.

The above rates will be effective on shipments received here on July 1st, 1919, and are subject to change without notice.

Ore Receipts at Trail.

Ore was received at the Trail (B.C.) Smeltery during the week ending June 30, 1919, as follows:

Mine—Location.	Gross Tons.
Centre Star, Rossland	1,262
Florence, Princess Creek	134
Josie, Rossland	236
Molly Gibson, Kitto Landing	25
Mandy, Le Pas	94
No. 1, Sandon	46
North Star, Kimberley	173
Sally, Beaverdell	26
Sullivan (zinc), Kimberley	4,241
Sullivan (lead), Kimberley	468
Total	6,705

Minister of Mines' Annual Report.

According to the Annual Report of the Minister of Mines for the year 1918, which has just been issued, the value of the mineral production for that period was $41,782,474.00. The preliminary report published early in the year estimated the valued production at $41,083,093.00. It will thus be seen that the officials of the Provincial Bureau of Mines were not far astray in their prediction of the monetary value of minerals produced during the past twelve months.

The report is in every respect a credit to the Department. It comprises many interesting tables of statistics and is well illustrated. Referring to the shipping mines of 1918 it is pointed out that there were 2,892,849 tons of ore shipped; that the number of mines shipping was 175; ;that the number of mines during the year shipping over 100 tons was eighty, and that the number of men employed above and below ground was 4,148. Figures show that coal mining produced has produced more than any other separate class of mine, a total of $187,147,653. Next in importance is copper, the value of which is placed at $145,741,069, and the next in order is lode gold at $97,121,786, while placer gold takes fourth place at $75,436,103. These, of course, are the gross values of the repective minerals mined in the Province up to the end of the past year.

The production of placer gold during the year decreased to the extent of $176,000, but an increase is indicated in the output of lode gold of $1.036,622, making a total increase of $860,622. The amount of silver produced was $3,498,172 oz., having a gross value of $3,215,870, an increase in the number of ounces of 568,956. In 1918 the output of lead was 43,899,661 pounds, valued at $2,928,107, which is an increase over the production of the preceding year of 6,592,196 pounds, but a decrease in value of $22,913 due to the drop in price of metal. Copper production totalled 61,483,754 pounds, valued at $15,143,449, an increase in amount of 2,476,189 pounds, or about 4.2 per cent. The value of the product was less than that of the previous year by $894,807, a decrease of nearly 8 per cent due to lower prices. The total tonnage of ore mined in the Province during the year was 2,892,849 tons, having a gross value of $27,590,278, and with the placer gold a total value of $27,910,278. The following table shows the tonnage derived from the various districts of the Province:

Cassiar-Omineca District	963,260
Southern Coast District	745,169
Boundary-Yale District	723,403
Slocan Mining Division	142,700
East Kootenay District	141,570
Train Creek Mining Division	112,349
Ainsworth Mining Division	44,937
Nelson Mining Division	15,348
Other Mining Divisions	4,113
Total	2,892,849

The conditions as to operations in connection with the various metals are dealt with, gold being the first considered. Production of placer gold is pointed out was about $320,000 as nearly as can be ascertained, there being considerable difficulty in obtaining exact figures. Placer gold mining is confined almost entirely to the Atlin and Cariboo Districts, 96 per cent of the total coming from these two sections. As to hydraulic placer mining, from which about 90 per cent of the placer gold obtained in British Columbia is derived, it has been well demonstrated that the gold output is in direct proportion to the number of days in which the water is available for piping. In touching upon lode mining the increase for the year of $1,036,622, or about 43.7 per cent, is explained as being largely due to the entry into the producers list of a new mine, the Surf Inlet Property of the Belmont Surf Inlet Mines, which made an output of about 411,600 ounces. Silver produced during the year represented an increase in value of $950,121, which was partly due to the high price of the metal. The Slocan District led all other sections in the production of this metal. As to lead, it is shown that the production was increased in the Fort Steele, Slocan and Windermere-Golden Districts, and decreased in the Ainsworth and Nelson District. It should be remembered that the Sulivan Mine of the Canadian Consolidated Mining and Smelting Company is located in the Fort Steele Division. Usually it contributes uearly all of the Division's output but last year over 860,000 pounds cames from the North Star mine. Dealing with copper the report mentions the very large production of the Hidden Creek Mines of the Granby Consolidated Mining and Smelting Company in the Skeena Division, and of the Britannia Mine in the southern coast district. In discussing the Granby Company's mines at Phoenix in the Boundary District it is said that they were unable to supply the smelter at Grand Forks with sufficient ore to run the smelter at capacity. "The ore reserves at these mines" the report continues, "are approaching exhaustion so that the large scale production of former years cannot be maintained. Also the high operating cost during 1918

left but little margin of profit in working the low grade ores at Phoenix." The recent closing down of the Phoenix mines and the Grand Forks Smelter bears out the conclusion to be drawn from the foregoing observations. As to the Canada Copper Corporation's operations at Greenwood, it is stated that the Mother Lode Mine contributed to the smelter there a slightly smaller tonnage than in 1917. About 154,000 tons were handled from which 1,832,382 pounds of copper was recovered, together with lode gold and silver contents. Towards the end of the year the smelter was closed, the ore reserves at the Mother Lode Mine being exhausted.

The following table shows the production of copper according to districts:

	Lbs.
Skeena Division	30,190,606
Southern Coast District	18,475,013
Boundary-Yale District	9,940,125
Trail Creek Division	1,654,356
Omineca Division	543,843
All others	579,811
Total	61,483,754

The zinc production of 1918 amounted to 41,772,916 pounds compared with 41,848,513 pounds in 1917. The value of this production is placed at $2,899,040. The following table shows the production of zinc according to districts:

	Lbs.
Fort Steele	26,704,806
Slocan	14,107,682
Omineca	313,112
Ainsworth	640,991
All others	6,325
Total	41,772,916

Thus an increase over 1917 is shown in the Fort Steele District of nearly six million pounds, which output comes entirely from the Sullivan Mines, the ore being treated in the Electrolytic Zinc plant at Trail. In the Slocan District the heaviest shipper was the Standard with a production of over seven million pounds.

Taking up other minerals the report discusses iron ore, stating that it has been strongly advocated in many quarters that the conditions are favorable for the establishment of an iron smelting plant somewhere on the British Columbia coast. So far nothing definite has materialized, although there is apparently a prospect of such a plant being established on this coast. As is well known there is on the coast in the aggregate an adequate supply of magnetite iron ore quite sufficiently free from impurities as to be within the "Bessemer limit" to supply ore for such a plant.

Dealing with coal, it is shown that the gross production of 1918 was 2,578,724 long tons, of which 276,479 tons was made into coke, leaving the nett production at 2,302,245 tons. These figures show an increase as compared with 1917 of 180,009 tons gross, and of 152,270 tons nett. The quantity of coke made was 188,967 tons, which is an increase of 29,062 tons over 1917.

The report then goes on to give an outline of conditions during the year in the six mineral survey districts by the resident mining engineers of those districts. Generally speaking they show that the mining industry over that period was in a very satisfactory state and that gratifying development may be expected.

GRANBY BEGINS TO PRODUCE COKE AND BY-PRODUCTS.

On July 11, the Granby Consolidated Mining, Smelting & Power Company began to produce coke and by-products in their coke ovens at Anyox. The big plant, which is the only one of its kind on the Pacific Coast, has been two years in preparation and is now in full operation.

Coal for the thirty-two ovens is supplied from the Granby's properties at Cassidy, Vancouver Island, from which steady shipments have been made to the northern smelter town for several weeks past. The coke produced is said to be of excellent quality and continued operation is expected.

The by-products of the coke plant include toluol, benzol, sulphate of ammonia and coal-tar, for all of which there is a consuming market. The coal-tar will be shipped to Vancouver to be fractioned into pitch and creosote, and will provide British Columbia points with a dependable product.

FORTY-NINE ON SALMON RIVER SHOWS HIGH RETURNS.

The work at "Forty-Nine" will begin the week, commencing July 5th, under the direction of Harry Howson, formerly of the Payne Mine in Sandon.

Silas Silverman, representative of his father, Sam I. Silverman, was expected to arrive also, but had to return to Seattle from Ketchikan.

This property was bonded a few months ago by Chas. A. Caldwell, Harry Howson and Sam I. Silverman and has a splendid showing.

The "Forty-Nine" lies just east of the Yellowstone group, on Salmon River. The locators were Dan and Andy Lindeborg. Three cuts showing an average vein width of twenty feet is the extent of the development. The highest open cut is thirty-seven feet wide and shows eight feet of fine looking ore. A recent assay went $359. in silver and $120. in gold to the ton.

During June Mr. Frederick W. Bradley, President of the Bunker Hill and Sullivan Silver-Lead Mines of Coeur d'Alene, Idaho, and head of the Treadwel Mines at Juneau was in Dawson and went on to Mayo to look over the silver properties there. Mr. Bradley was accompanied by Mr. Thomas McDonald, Mining Engineer.

Mr. F. Wernickie, Geologist for the Alaska Juneau Mine and other properties in which Mr. Bradley is interested, was also in the Yukon looking over properties.

Alex. McLeod, one of the pioneer mining men of British Columbia, died at the Kootenay Lake General Hospital, Nelson, recently. He had been in the Ainsworth District for more than 35 years. The Tam o' Shanter silver-lead mine was owned by Mr. McLeod and, while it is not producing at present, the deceased had been doing his assessment regularly and had confidence in the property. Among the properties on which he worked since coming to the Province were the Blue Bell Mine at Riondel, the No. 1 Mine at Ainsworth and the Highland Mine at Ainsworth.

NORTHERN ONTARIO.

The Cobalt Strike.

Cobalt, in the afternoon of the 23rd of July, witnessed the spectacle of a thousand men on "strike" parade. Since when not a wheel has been turning at the mines. The pumps have been withdrawn from underground and the industrial war which has threatened the camp since early summer is at last a reality. The die has been cast, twenty-two hundred men have ceased to work, a pay-roll of close to $300,000 monthly has ceased. Merchants and business are being hit hard locally, manufacturing concerns to the south are suffering, and the country as a whole is losing the benefits heretofore accruing from the production of from $40,000 to $50,000 worth of silver every twenty-four hours.

Among those affected there does not appear to be a very favorable opinion of the ability of Senator Robertson, Minister of Labor, at Ottawa, as demonstrated in the manner in which he handled the situation. It is even intimated that he blundered hopelessly.

As to just how long the labor strike will last, it would be extremely difficult to hazard an opinion at this time. As to where the entire responsibility rests perhaps no one individual could be singled out, and it would be folly to condemn the efforts of any man.

The great pity is that hundreds of men who can ill afford to be out of work for any very great length of time are now idle. Already the second-hand dealers are doing increased business, including the purchase of jewellery from individuals who declare they are disposing of excess personal belongings so as to pay for transportation to other districts.

The Union is keeping pickets at work, but the work in this direction is slight, due to the fact that no attempt is being made to operate the mines. Instead, as previously stated, the underground workings are being permitted to flood with water.

General opinion appears to be that the strike will not be of long duration, but as to this it would be impossible to intelligently forecast. At worst, the cost of closing down, and, at some future date, the cost of pumping out may represent the sole loss to the shareholders of the various companies. There is even a possibility that the elimination of the usual silver output from the mines of Cobalt might cause the quotations for silver to increase sufficiently to offset the expense incurred. Should this prove to be so, the present period may be considered but a lull in the prosperity of the mines.

Situation in Porcupine District.

The impression seems to be that the mine workers in the Porcupine district will abide by the decision recently reached whereby the mine employees and the mining companies will co-operate in an endeavor to reduce the cost of living. This plan, provided it proves succesful, bodes well for the Porcupine mines, and the great gold field may reasonably be expected to attract mine workers in abundance, a condition which has not existed since the second year of the recent war. The labor strike at Kirkland Lake continues. In the Boston Creek district, as at Porcupine, operations are proceeding without interference.

Late advice from the Porcupine district indicates the likelihood of the Hollinger, McIntyre-Porcupine, Dome Mines, and Porcupine Crown adopting some satisfactory method of protection by insurance against sickness by which the men will receive indemnity equivalent to half-pay.

The arrangements for opening a co-operative store are in full swing. A. F. Brigham, General Manager of the Hollinger, together with R. J. Ennis, General Manager of the McIntyre-Porcupine are giving the matter their personal attention and in this connection they visited Toronto a few days ago.

It is understood the men who represented the employees at the conference with the mine managers presented the outline of the arrangement to a meeting of the Union and the plan was endorsed by a large majority.

So far as can be learned, mining operations in the South Lorrain district are not being interfered with by the labor strike in Cobalt, the management of the properties not having been notified as to any demands from the union.

The Pittsburg-Lorrain and the Keeley are the only two properties being worked in a small way.

A shortage of labor continues to retard progress in the Porcupine district, in spite of the fact that about 450 men have left the Kirkland Lake camp due to the labor strike there and that in Cobalt there is a surplus of labor even before the strike. The Hollinger mine is stated to have a less number of men on its present pay-roll than the number employed before the Kirkland Lake strike was called. Just where the mine workers have gone from the Kirkland Lake camp, and from the Sudbury mines as well, remains somewhat of a mystery. Although the readjustment is slower than had been expected, yet the change, even though gradual, is, nvertheless, inevitable. The reward, when reaped, will probably be found to have abundantly justified the magnificent patience which the average shareholder has shown.

According to reports from the Porcupine district, the Dome Mines Company is now paying $4 daily to its underground employees, this being equal to the wages being paid at the Hollinger and at the McIntyre-Porcupine.

In the Porcupine district a shortage of labor is still felt, but it showing gradual improvement, and is expected to still further improve because of the labor troubles in the Cobalt District.

Progress in the Newer Districts.

Geological surveys being made in the gold bearing districts of the North will this year provide the necessary data to prepare a geological map embracing the Kirkland Lake, Boston Creek, and Larder Lake districts.

Surveys have previously been carried out in each of the districts mentioned, but not in a manner that would permit the connection of the three fields. This year's work is expected to be of considerable value to prospectors and mining men active in the three districts referred to.

The Miller-Independence mines is proceeding with the erection of additions to its mill. It is planned to have the equipment installed and treating about 75 tons daily before cold weather sets in.

The number of drills is to be increased to about seven, it is stated officially.

Diamond drilling on the O'Donald property during the currency of an option held by the Allied Gold

Mines resulted in indicating a vein some 28 inches in width containing from $19 to $29 in gold to the ton.

The O'Donald is situated between the property of the Patricia Syndicate and the R. A. P. Syndicate. At the time of writing, further drilling is being done near the west boundary of the Patricia.

Mining interests engaged in the development of properties in the Boston Creek district continue to criticize the Ontario Government for its failure to provide a road for the benefit of the mines. It is pointed out that a definite promise was made last spring to build the road, but as yet nothing has been done. The Boston Creek camp is about the only important mining centre in Northern Ontario which has received no assistance from the government.

Some difficulty is reported in the Kirkland Lake district in regard to the construction of the macadam road from Swastika to the centre of mining activity. It is learned that it has been found less convenient to secure the desired waste rock from the mines than had been expected. As to the seriousness of the situation, and as to whether or not it is due to the mines being closed due to the labor strike has not been ascertained.

Prospectors, and particularly returned soldiers are urging that some steps be taken in an endeavor to throw the Gillies Limit open for prospecting this fall. October 1st is the date suggested. It is pointed out that after that date there is little or no danger from forest fire and that prospectors would have time to explore the surface of their claims and conduct further exploration work during the winter by the sinking of test pits. This would aid the prospector, and provide work for quite a number of men, in addition to being of much benefit to merchants and business men in the Cobalt district. It would also result in a substantial revenue for the Province in claim recording fees. Hon. G. Howard Ferguson, Minister of Lands, Forests and Mines, is expected to lend a sympathetic ear to the proposal.

Favorable assays as a result of a careful sampling of the Hull-Kipper claims in the Tashota section of the Kokwash gold area has attracted considerable attention. The mineralized dike is stated to be upwards of two hundred feet in width, with a section some fifty feet in width containing a large tonnage of low-grade ore. Although some of the mining companies operating in Northern Ontario have endeavored to secure the property on a working option basis the present owners have not consented to deal along such lines. Big interests have endeavored to secure an option of sufficient length to permit a thorough exploration of the property by diamond drills.

Gold in the Aguinica Mine.

The discovery of visible gold in ore taken from the old Aguinica mine situated a little to the east of the silver producing area of Cobalt has aroused a good deal of curiosity. In the feverish hunt for silver in the early days on this property, the presence of native gold was apparently overlooked. It would appear that the gold occurs only where the vein passes through Keewatin formation. On surface, where the vein occurs in conglomerate, the filling consists of calcite containing a high percentage of cobalt mineral, with low silver values. As a depth of about 150 feet where the vein passes into the underlying Keewatin, the filling of the vein changes to quartz containing visible gold. The Aguinica is under option to one of the leading silver mining companies of Cobalt and a thorough examination of the property is being conducted.

Cassel Cyanide Co. to Incorporate in Canada.

The Cassel Cyanide Company, the most successful cyanide manufacturer in the world announced in last weeks' Journal that it will incorporate a subsidiary company in Canada. The chief reason for this important step is not difficult to find.

The mining industry of Canada, particularly Northern Ontario, is growing apace. Manufacturers of low-grade cyanide are making a strong, yet ineffective bid for the patronage of our mines. Home industry is bound to ultimately be given the preference. At least, should Canadian manufacturers be able to successfully demonstrate the manufacture of a material that could take the place of the high-grade article imported from Glasgow, Scotland, then there is every reason to believe the Canadian product would soon be filling at least ninety per cent of the requirements of the mines of this country.

As yet, the cyanide manufactured in Canada has not come into favor at the mines. Its use is more general in other directions, particularly in the fumigation of orchards and as a fertilizer. Although love for home enterprises would undoubtedly weigh the scale in favor of Canadian preference, yet no Britisher and least of all Canadians should hesitate to continue the patronage of the Cassel Cyanide Company unless or until Canadian enterprise succeeds in producing an article that can closely compare in quality with the high-grade material now being imported from Scotland.

At the outbreak of war a large amount of cyanide used in the British Empire was being imported from Germany. British ingenuity was taxed to the full limit of its powers to meet the situation. Gold mines everywhere faced the possibility of not being able to operate. All eyes in the Empire turned to the one hope —the Cassel Cyanide Company. The Germans lauded their alleged cyanide monopoly as one of the weapons that would win the war. They reckoned without the ingenuity of the bull-dog breed. The Cassel Cyanide Company not only succeeded in supply the requirements of the mines in the British Empire at almost normal prices, but permitted the export of the limited quantities to allied countries.

Canada, therefore, is glad to welcome the incorporation of a subsidiary company in this country. If the move is backed by similar enterprise as that which defied the alleged German monopoly, then the Canadian manufacturers will be compelled to put forward the best efforts to carry on successful competition.

A cyanide test is being conducted at the ore-testing laboratory of the Haileybury Mining School, for the purpose of comparing the low-grade cyanide manufactured in Canada, at Niagara Falls, and the high-grade article manufactured in Glasgow, Scotland. The test will cover a period of about twenty-four days, and the result might reasonably prove to be of far-reaching importance for the Cassel Cyanide Company of Glasgow, or for the American Cyanimid Company, of Niagara Falls, N.Y.

T. J. BROWN.

General Superintendent, Nova Scotia Steel & Coal Co., Sydney Mines, N.S.; Member of Council of the Mining Society of Nova Scotia, and recently appointed Chairman of a special committee of the Canadian Mining Institute to consider the formation of a Coal Mining Section of the Institute.

NICKEL

Shot—High and Low carbon **Ingots—Two sizes, 25 lbs., 50 lbs.**

ELECTROLYTIC NICKEL—99.80%

Prime Metals for the Manufacture of Nickel Steel, German Silver, Anodes and all remelting purposes
Our Nickel is produced as Rods, Sheets, Strip Stock, Wire and Tubes.

MONEL METAL
(Reg. U.S. Pat. Off.)

We are SOLE PRODUCERS of this natural, stronger-than-steel, nor-corrodible alloy.

Manufactured forms are Rods, Flats, Castings, Tubes, Sheets, Strip Stock and Wire.

The Cost of Coal Production as Influenced by the Balancing of the Working Organization

(From Iron and Steel of Canada)

The initial cost of fuel very gravely and intimately concerns manufacturers and fabricators of iron and steel, and at the present time the high costs of mining coal are probably the chief deterrent to lower prices for iron and steel products.

Prominent among the reasons for the increased expenditure required to produce coal is the unbalanced condition of the working forces at the collieries, primarily due to the requirements of military service.

At the collieries in Nova Scotia voluntary enlistment acted in a very discriminating manner, because by a natural selection there was attracted to the colors the very pick of the productive forces at the collieries. The specifications of military fitness, which as is well known were more exacting in the early months of the war than was the case later, encouraged the selection of young men, physically vigorous; and, by a similarly discriminating process, voluntary enlistment chose the men of mental and spiritual energy. The effect of all this upon the colliery organizations was extremely partial, because, in the first instance, the nature of underground employment tends to create two fairly sharply divided classes of workers, in the first of which classes, usually known as the "producers" will be found the young, vigorous and more ambitious workers employed chiefly at the "face" where the actual digging of coal takes place. The second class, namely, the so-called "non-producers," include the shiftmen, repairers, haulage attendants and the surface workers, and these men are, broadly speaking, made up of boys too young for work at the coal-face, and older men past their prime, or unfitted by capacity or inclination for actual production of coal. Among the first-named class are also to be found a large percentage of young married men, because the miner reaches his maximum earning capacity in early manhood, and he usually marries early.

The effect of voluntary enlistment was therefore to greatly reduce the numbers of the producing class, and to reduce very slightly, or not at all, the non-producing classes. The financial result was inevitable, seeing that the tonnage of coal produced sharply declined without any diminution of the overhead charges and the cost of taking the coal away from the face. This unbalancing of the working forces at the collieries has been, and still is the main factor in increasing the production costs of coal.

Apparently this phenomenon is not peculiar to Nova Scotia, and, with the close of the war, some figures are available from British sources showing that a similar cause has operated to raise the production costs in Great Britain. The following figures, condensed from some informative tables compiled by Mr. Finlay A. Gibson (Secretary of the Monmouthshire & South Wales Coal Owners' Association) compare the annual coal production of the United Kingdom for 1913 and the war years, with the number of workmen on the surface and underground, and show the percentage of increase or decrease from the standard of 1913:

A study of the table will show that while the production of coal in 1918 fell to 21 per cent below that of 1913, the number of workmen employed on the surface was only lessened by two per cent.

If it were possible to still further separate the figures of the underground workers into face-workers and the remaining classes, it would undoubtedly be apparent that the entire reduction, or nearly so, would be found in the number of the workmen employed at the coal-face.

Read in conjunction with the foregoing tables, Sir Auckland Geddes' recent announcement in the House of Commons that the production of 1919, owing to the reduction of the working hours to seven hours per day, would not exceed 214,000,000 tons, and that the number of workmen engaged in the industry is now equal to the average of 1913, namely 1,111,000 men, it is quite clear that the cost of coal in Britain must be rapidly increasing.

There is no data available on which to institute comparisons with the United States in this connection, but, as that country was able to learn from our experiences, and was able to organize for war under a selective draft system that avoided the dislocation of pivotal industries, it was also able to avoid the unbalancing of the colliery organizations to the same extent as occurred throughout the British Empire as a whole. There was some little inconvenience in 1914 when British citizens and citizens of other belligerent countries went home in large numbers from the United States coal districts, but between that date and the entry of the United States into the war the colliery forces had been recruited to normal strength.

During the war period, the United States took advantage of its unparalleled resources of coal, and increased coal production in a really marvellous fashion, and that it was able to do so, was largely due to the fact that the selective draft recognized the necessity to retain coal producers at their work.

The larger steel companies of Canada are all miners of coal for their metallurgical processes, and there is probably no department of their operations which is

			Workmen Employed.					
Year.	Tons.	% *	Underground.	% *	Surface.	% *	Total.	% *

Endurance Brand Balls

We have found a steel and also discovered a treatment for these balls which gives extraordinary performances in action by resisting abrasion and withstanding shocks. All sizes.

Prices on application

CANADA FOUNDRIES & FORGINGS, Limited

Canadian Billings & Spencer Plant, WELLAND, ONT.

more important in its bearing on their ability to compete in the steel markets than the question of economical organization at the collieries for the production of coal.

It is perhaps some little consolation to know that similar factors of increase in cost are operating in other countries, or otherwise Canada would be placed at a serious disadvantage. The inclusion in the draft fo the League of Nations of the clauses relating to labor and the hours of work may yet serve to safeguard those allied countries where the rate of production is being decreased and the cost increased by the adoption of greatly shortened hours of work.

Burnett & Crampton, Rigaud, Que., contemplate building a new foundry capable of turning out about 250 tons per month of castings and will shortly be calling for tenders for the building and equipment. The equipment will consist of molding machines, which with all other equipment will be of the most up-to-date type, and they figure on having one of the most modern foundries on the continent specializing in high grade machinery castings, cement mill and mining equipment together with a general casting business.

BRITISH COLUMBIA NOTES.

Mr. Robert A. Boyce, Mining Engineer of Cobalt, and well known throughout the Cariboo District, B.C., has lately examined some promising looking quartz prospects in the district.

During his visit Mr. Boyce was the recipient of congratulations from his Cariboo friends on his election as a Councillor of the Canadian Mining Institute.

A pack train which recently took supplies up the Illiance trail to the United Metal property, Alice Arm, could not bring out ore as planned on account of the very bad condition of the trail. Considerable work above eight mile is necessary to allowing the mines to get out ore this season. The district engineer has advised that an appropriation for this work has been requested.

After an absence from the Nelson district of a year, W. J. Elemendrof, the Seattle mining engineer has reached Kalso, to make an inspection of the Slocan on behalf of principals south of the line. His work, which will be confined to the district adjoining the K. & S. line, will consume nearly a week. Mr. Elmendorf was engineer of the Slocan Star mine during the period when that well known Slocan property was in litigation.

After two years of development work on the Rand group at Apex, above Cottonwood Lake, Nelson district, John Swanson who was in Nelson to purchase supplies, estimates that he is now within four feet of the long-sought lead, and that he may break through to it any time.

This is the property on which was found, nearly 30 years ago, at a depth of 100 feet, a piece of galena and zinc float, nearly two feet long, which contained free gold, the float assaying $1,000 to the ton. Many times Mr. Swanson came back to his old prospect, hoping to find the lead from which the float came, and at last he found it outcropping from a gulch. At first he ground sluiced from the creek and confirmed his find, striking a lime dike, which led him to expect galena.

Two years ago he started in to look for the vein at depth and started a tunnel. After going in 40 feet he struck an open seam and found that he was above the lead. He then turned to the right, and this crosscut has now gone in 40 feet, and he has struck ore, which is apparently just outside the lead itself.

The Rand group is owned by three partners, Mr. Swanson's associates being Otis Hawkins and T. Burnham.

UNITED MINE WORKERS OF AMERICA REVOKE CHARTER OF DISTRICT NO. 18, ALBERTA AND BRITISH COLUMBIA.

Because the district officials of District No. 18 of the U. M. W. of America have taken out membership cards in the "O. B. U." the International Headquarters of the U. M. W. of America has revoked the charter and announced that the district ceases its affiliations with that body. The miners in District No. 18 are at the present time on strike, and indeed the district has become notorious for its constantly disturbed condition, and its disregard of union rules. The dissatisfaction of the International Executive of the U. M. W. with the conduct of affairs in District 18 is very natural, and there can be little doubt that it would welcome the opportunity which the action of the local leaders has given to rid the parent union of an unprofitable and unruly district.

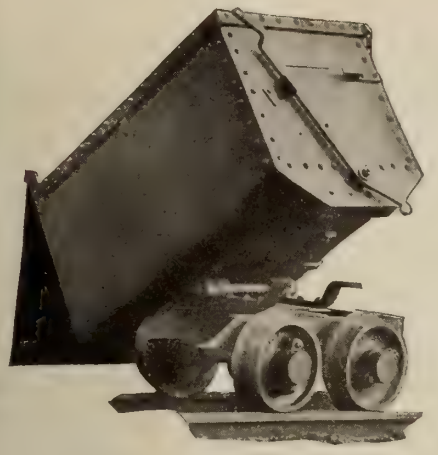
MINE CARS

We make the kind of Car you want, and make it just the way you want it made.



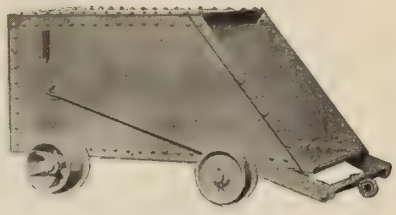
MADE IN MANY SIZES

ROTARY—Will dump at either side or either end

This is only one of the many styles of Mine Cars we offer. Let us know the type of car you prefer, and we will give you attractive prices.

Write for your copy of our new Mining Catalogue Just off the press.

We have been designing and building cars for a quarter of a century. Our designers know their business, and are at your service free of charge.



STEEL SKIPS

For use on Mine Tipple. Made any size to suit your work, and if desired, with double bottom, and rivets countersunk and flush on the inside, to facilitate easy dumping.

HEAVY BUILT PUSH CAR

A good general purpose car for any kind of heavy work. Heavy steel frame work decked with 2½ in. or 3 in. planking. Self-oiling babbitted boxes. Made for any gauge of track, and any required weight to suit the load.

If you use Wood Cars we can supply you with the wheels, Axles, Boxes, etc., so you may build your own cars. You will save money by so doing.

NOVA SCOTIA NOTES.

The leaders of the United Mine Workers of America in Nova Scotia have again announced that the five days week will be inaugurated commencing 2nd August, and in making the announcement the leaders state the union is taking this step on its own initiative and that the coal operators have not been consulted thereon. This ill-considered action of the union leaders would no doubt attract more attention were there any immediate possibility of the collieries working six days a week, but in the present condition of orders and shipping it will be fortunate if some collieries can get three days work weekly. Hon. Robert Drummond, in the "Mining Record" comments ironically as follows:

"Admitted that the C. B. miners leaders' view on economics are somewhat or largely fantastic, they know what they are doing in respect of a five day week. It is not to reduce the output. It is to prove to the operators that though they have called them by times, by harsh names, they carry no ill will toward them, in fact are desirous at times to make demonstration of their good will. The five day week is not advocated for the purpose of reducing output. At the present time or rather in normal times the days worked by men did not average more than five days, if it went that high. The proposal of the executive is that instead of numbers being idle on each day of the week, the men will after the first of August all be idle on the same day. This we are sure will be received with approval by the operators. If the men all stay idle on one day and work the remainder, then the ordinary six days output is secured on a five day costs sheet. Elsewhere we state that the men won't work five days. In that event even the output, we are forced to admit, will be reduced, but the important fact remains that the costs sheets will extend over five and not six days a week. We present this view of the subject to drive off some of the gloom the five day week announcement caused, and to show that there is a silver lining on at least one side of the cloud."

It is somewhat significant that the reiteration of the five days week announcement should coincide with a semi-official explanation of the temporary closing of the Sydney Steel Plant which states that it is not unconnected with the unsatisfactory state of labor in the district, and that the unascertainable nature of the costs of manufacture due to the labor conditions at the collieries is preventing the Dominion Steel Company from making quotations for new business.

Mr. D. H. McDougall, president of the Scotia Company, has completed, for his company, the purchase from the British Ministry of Shipping, represented by Director J. B. Whyte, of New York, the coal handling plant on the Canadian National Railways terminals at Halifax. This plant is one of the most modern and efficient of its kind on the Atlantic coast, and its erection was deemed necessary by the Admiralty in order to enable the port of Halifax to take its proper place as the best and most advantageous shipping port on the North Atlantic coast.

The plant played a most important part in making Halifax the main artery of all troop transport movements in Canada during the past few months. Without this plant the Olympic, whose magnificent efficiency during the war caused her to be affectionately known by the Halifax people as the "Atlantic ferry," could not have been coaled satisfactorily. By its aid, however, this magnificent steamer has been accustomed to call and get away from the loading plant with full bunkers of 5,000 tons in three days, a performance that cannot be surpassed anywhere.

"It is therefore of considerable interest to shipping men and the whole coastal trade of North America to know that Scotia has obtained the possession and use of this splendid coal loading plant," said Mr. McDougall yesterday. "Scotia has always maintained a leading position in the bunkering business, for which its splendidly situated shipping pier at the entrance of Sydney harbor and the traditionally excellent character of old Sydney coal have especially equipped it.

"In acquiring the Halifax plant, the Scotia Company shows another instance of progressive management and farsightedness, and its action will, it is believed, be thoroughly appreciated by the people of Halifax. It is an evidence that the present management of Scotia is prepared to taken advantage of every opportunity to enlarge and improve the company's facilities for handling and disposing of its vast stores of raw material.

"The people of Halifax are to be congratulated that the growing importance of Halifax and its still greater future should be thus recognized and much significance is to be attached to the entry of such a well-equipped and experienced bunker company as Scotia upon the Halifax waterfront. Without such a plant the capabilities and possibilities of Halifax have been very much curtailed. With such a magnificent plant and the backing of the Scotia Company, Halifax is now able to offer facilities for coaling with regularity and dispatch unsurpassed by any other Atlantic seaport."

NORTHERN ONTARIO PERSONALS.

Mr. Harry Donaldson has been appointed manager of the Beaver and Kirkland Lake Mines.

Frank Groch, of the Groch Centrifugal Flotation, Limited, has returned from a business trip to southern points.

Martin Childerhose, of Toronto, recently visited Kirkland Lake district in connection with mining interests there.

Harry Donaldson has been appointed superintendent of the Beaver Consolidated Mines, succeeding L. W. Ledyard, who resigned recently, prior to leaving for the south-western states. Mr. Donaldson was in charge of work at the Beaver Auxiliary property at Elk Lake some years ago, and has since been engaged in mining near Madoc. As to whether or not he will also take charge of the Kirkland Lake Gold Mines for the Beaver Company has not been learned.

Hon. G. Howard Ferguson, Minister of Lands, Forests and Mines, paid a flying business to this district early this week.

Frank L. Culver, president of the Beaver Consolidated came north Thursday morning.

D. McPhail, who has managed the operation of the Hudson Bay Mines, Cobalt, for the past few months, has been appointed manager of the Dome Lake mine at Porcupine. It was reported a few days ago that Mr. Hutchinson, of New Liskeard, had taken over the management. This report was erroneous. Mr. Hutchinson is secretary-treasurer of the Hudson Bay and the Dome Lake Mines.

CANADIAN MINING INSTITUTE'S PROSPECTING PLAN NOT FAVOURED BY THE GOVERNMENT.

The August "Bulletin" of the Canadian Mining Institute, states:

"It is with very real regret that we are obliged to announce the failure of the Institute's efforts to induce the Dominion Government to adopt the plan, as submitted by Mr. Dresser, for the employment of returned soldiers in national prospecting. As was noted last month, after receiving an intimation from the Minister of Mines of his inability to awaken the interest of his colleagues in the merits of the proposal, which, therefore, was rejected in Council, it was decided to bring the matter directly to the attention of the Prime Minister. This was done by a deputation; but before the termination of the interview the Institute's representatives had arrived at the conclusion that they might expect to receive a negative reply. Unfortunately this premonition proved to be only too well-founded, for a few days later the Secretary was officially notified that the decision of the Cabinet to reject the scheme would not be reconsidered. This was further confirmed by a statement by the Minister of the Interior in the House of Commons, in reply to a question addressed to him by the Hon. R. Lemieux. The nature of this reply clearly indicates that the Government signally failed to appreciate the main aim of the proposal or the direct and indirect benefits that would indubitably result from its adoption. The main aim, of course, was to stimulate and popularise prospecting for minerals in Canada, by Government recognition and encouragement, of the prospector's avocation. The need for prospecting is great, and doubly so now when it is so vitally necessary that the natural resources of the country should be developed and utilised to the fullest possible extent in order that the country's appalling load of debt consequent on the war may be lightened. But curiously enough Canadian statesmen, even men so enlightened as Mr. Meighen, are seemingly unable to grasp the fact that mining is as much a basic industry and as much entitled to encouragement as agriculture, which latter the Government is ever ready, quite properly, to aid. To mining recognition is persistently refused. This industry indeed which even to-day in productive importance holds in Canada the second place, but which eventually may occupy the premier position, so vastly greater are our minerals in relation to our agricultural potentialities, is denied its own representative in the Cabinet, but must be content to be represented by a minister—frequently one of minor rank—holding a dual and unrelated office. Is it to be wondered at then that failing a forceful advocate in the councils of the Government all suggestions to Government to aid mining, however disinterested and well-considered, should fall to the ground."

Unfortunately, Cabinet portfolios continue to be regarded as political rewards, and not as administrative offices. The idea of appointing a mining engineer as Minister of Mines is too elementary, too sane, too efficient to commend itself to politicians. For such administrative functions as Minister of Railways, of Finance and Agriculture, straight-thinking, not to say ingenuous members of the technical professions, might consider a railway manager, a bank official, and a farmer, but seemingly there must be other and weightier considerations than ability and fitness in filling cabinet offices. The appointment of Dr. Tolmie, a farmer, to the post of Minister of Agriculture, is an exhilarating exception, and gives point to the criticism of the Bulletin that the government cannot grasp the basic importance of mining as they do the importunities of the farmer.

What is the reason? Is it because the farmer is more vocal, or because there are more of him?

The proposal made by the C. M. I. in regard to prospecting had in view not only the employment of returned men, but also the opening up of the unprospected areas of Canada, and the proposal originated out of a desire to assist rather than encumber the government. The Institute was genuinely desirous to assist in the problems of reconstruction, but its proposals received scant consideration.. Indeed, although the scheme formulated had received the earnest and protracted consideration of some of the ablest geologists and some of the most experienced heads of mining enterprises in Canada, the Minister of Mines felt justified in surmising that "the advantages which might be secured from a mining point of view are regarded as more or less doubtful."

Which is equivalent to stating that the Canadian Mining Institute had submitted an ill-considered and impolitic proposal, chiefly impolitic we surmise.

EDUCATION AND CITIZENSHIP.

In Winnipeg, October 20-22, it is proposed to hold a National Conference on "Moral Education in the Schools in Relation to Canadian Citizenship." Elsewhere in this issue will be found the announcement of the Convening Committee, and for further details would refer our readers to the General Secretary, Professor W. F. Osborne, of the University of Manitoba. It may be thought that it is a singular departure from established procedure to ask the readers of a mining periodical to consider the ethics of pedagogy, but the times are singular, and we have good precedent in the action of the associated technical societies of Canada that have joined in the approval of a Memorial on education, that is likewise to be found in this issue.

The Committee that prepared this Memorial may be regarded as expressing the opinion of the engineers and technicians of Canada, and, if for no other reason, this unprecedented expression of opinion from a usually inarticulate group of persons, gives it a first-class importance. Two of the recommendations of the Committee touch the roots of our educational problem, namely, the necessity to provide a sufficient number of sufficiently educated teachers before any large expansion of the scope of education can take place in Canada, and, secondly, the necessity to lengthen the period of compulsory education of children. It is also suggested that some form of continuation education should be made compulsory for two or more years after the close of the school-age proper.

The world is very crazy today. There is a great deal of running to and fro in the earth, and a perfect avalanche of free advice, much of it worthless, and people are getting tired of talk of "uplift" and prohibition, and millenial schemes that ignore the little peculiarities of human nature and the general applicability of the Decalogue to modern times. It is therefore, refreshing to find, that nothing revolutionary or impossible is advocated by the Memorial referred to, but that everything it recommends is a natural outgrowth from our existing educational systems. It merely asks that growth should be assisted and that good should be made, if possible, better. Therefore we bespeak for the Memorial the earnest consideration of the Federal Government, and of the provincial governments also, particularly when considering the disposition of the appropriation which Parliament has approved for federal assistance to technical education.

BAD HOUSING AND ANARCHY.

Our King is a sensible man. His occasional expressions of opinion, not too freely proffered, are so sane and true, that like the Decalogue, they are out-of-date, and not fashionable, and not nearly so popular as the opinions of the Fabian Society.

Recently, King George said that better housing and an enlarged, and freer scheme of education were two things he desired to see and would personally strive for. His utterance does credit not only to his heart, but also to his statesmanship.

Has anyone noticed the sinister connection between bad housing and industrial strife in its worst and ugliest shape?

Dublin and Glasgow possess some of the most hopeless and evil slums on earth, and everyone knows what has happened there. At the moment of writing, the slum-dwellers of Liverpool, who live, as a newspaper despatch says with unconscious irony, in "a well-defined area" are rioting and pillaging during a strike of the police.

London has not been conspicuous as a centre of rebellion in recent years, but entirely otherwise, and who knows what trouble has been avoided by the abolition of the evil rookeries that disgraced the Capital in former years.

A great deal of the trouble in the British coal industry originated in the housing conditions in the Lowland coal districts, and in contemplation of the hideous results of the one-room house which is not uncommon in Scotland, the public and the Coal Commission overlooked the great advances which miners' housing has made in recent years in South Yorkshire and elsewhere in Britain.

In Canada we have some plague-spots, some true nurseries of revolt proceeding from hopelessness. The water-front of Halifax, the so-called "Cokovia" of Sydney, and certain "well-defined areas" of Montreal and Toronto, menace the existence of the decent amenities of more favoured localities.

It is usually, and unthinkingly assumed that the present day danger of revolt and resulting anarchy, that spewing-up of the subterranean volcanoe which Carlyle reverts to again and again in his "French Revolution" as a symbol, comes from the poor and so-called labouring classes. But does it?

Many of the poorest workingmen are carrying on a daily struggle against their surroundings, trying to cling to the decencies of life and the consolations of old-fashioned religion and morals. These people are not dangerous to the social fabric—indeed they are its salt and savour—unless by the selfishness and apathy of those who vote and thereby govern this country, their surroundings are allowed to remain abodes of hopelessness and caves for the Adullamites of today.

The poor are not the anarchs of modern society. It is the profiteer, the slum landlord, and the wealthy alien who exploits his ignorant countrymen in our midst, that have thrown off the bonds of restraint. Some person has recently spoken of England as "a country where the population consists of the nice people whom the war had impoverished and the nasty people it has enriched," and Canada may be divided along similar lines.

There are happily signs amongst us that the menace of slums is realised. In the Memorial on Education—elsewhere referred to in this issue—it is advocated that instruction in community and national life, lessons in citizenship, and the value of the vote, should be included in the curriculum of the elementary schools. This seems a sensible proposal. Why should not the possibilities of town-planning, and the dangers of the slum be taught to children before their minds have lost their receptiveness, and before the alluring money-making possibilities of rack-renting slumdom has dulled the conscience of the prospective voter?

We have especial responsibilities in Canada because our population is cosmopolitan, and we have already had sufficient evidence of the atavistic lapses of aliens in our midst to warn us against permitting the growth of the slum in our still infant cities. Lines

by a former Editor of the "Atlantic Monthly" seem equally applicable to Canada as to the United States:

"Wide open and unguarded stand our gates,
And through them presses a wild, motley throng—
Men from the Volga and the Tartar steppes,
Featureless figures of the Hoang-Ho,
Malayan, Scythian, Teuton, Kelt and Slav,
Flying the Old World's poverty and scorn;
These bringing with them unknown gods and rites—
Those, tiger passions, here to stretch their claws.
In street and alley what strange tongues are loud,
Accents of menace alien to our air.
Voices that once the Tower of Babel knew!
"O Liberty, white Goddess, is it well
To leave the gates unguarded? On thy breast
Fold Sorrow's children, soothe the hurts of fate.
Lift the downtrodden, but with hand of steel
Stay those who to thy sacred portals come
To waste the gifts of freedom. Have a care
Lest from thy brow the clustered stars be torn
And trampled in the dust. For so of old
The thronging Goth and Vandal trampled Rome,
And where the temples of the Caesars stood
The lean wolf unmolested made her lair."

SERIOUS CONTRACTION OF PRAIRIE PROVINCES' COAL SUPPLY CAUSED BY STRIKES.

The Minister of Agriculture for Saskatchewan recently wired the Minister of Labour at Ottawa as follows:—

"Protracted strike Alberta coal mines causing serious fuel situation in Saskatchewan, practically all local stocks, domestic and steam coal exhausted. Winter's supply aggregating a million and a quarter tons yet to be mined and shipped, other years considerable tonnage received during July, none this year. Many hundreds steam threshing outfits may be unable to operate unless steam coal is available quickly. Would impress seriousness of situation and urge necessity of promptly resuming coal mining operations in Alberta."

It is said that practically no coal was sent from the Alberta mines to Saskatchewan during July, although in July, 1918, the largest shipments of Alberta coal during the whole year were made. It is a great pity after having so conclusively demontrated that Alberta coal could supply the home requirements of the Middle West, as was done last year, that the protracted and useless strikes at the Alberta collieries should have undone all the work that the Fuel Controller effectively commenced in 1918. Last year the Alberta miners asked the Canadian Government to put an embargo on American coal so as to help the production of the Alberta mines, and this year, in defiance of their own labour union, the Alberta miners have causelessly thrown the collieries idle during just that portion of the summer when coal production is most effectively carried on, and when transportation for the coal is available, as it will not be available when the grain commences to move, and when winter sets in. Indeed, it is said that the coal shortage occasioned by the strike is hindering the threshing of the grain, so that the evil is a double one.

POOR ROADS DELAY DEVELOPMENT OF BOSTON CREEK AREA.

At the Miller-Independence mine, three miles from Boston Creek, there is known to be a promising gold deposit, which is quite different in character from those of the producing gold mines of Northern Ontario.

It is highly important that this deposit should be promptly developed. There may be many more deposits of similar nature yet undiscovered, and all that can be learned about this one should be made available as soon as possible. We regret that the operators are not being given proper assistance by the Government of a Province which profits so largely from the development of its mineral resources. A good road to the property should be built.

It has been generally admitted that the production of gold is highly desirable. It is not always easy to indicate the best means of encouraging production, but one fact is well established, and that is that the Government should do its best to furnish roads for promising districts. Up to date next to nothing has been done for the operators in the Boston Creek area, so far as roads are concerned. We hope that the development of the Miller-Independence gold deposit will not long continue to be hampered by transportation difficulties. It is by no means the only promising property in the area; but it is of itself of sufficient importance to warrant the Government building a wagon road which would not only serve this property, but the many others in the neighborhood.

Gold mine operators are spending large sums of money in developing properties. They should not be expected to construct provincial highways with the funds that are provided for exploration of ore deposits. The Ontario Government can show its intention to assist in the development of mineral resources by giving prompt attention to the needs of the Boston Creek area.

EDITORIAL CHANGES.

Mr. Reginald E. Hore, mining geologist, who has since June, 1913, been the Editor-in-Chief of the Canadian Mining Journal, is retiring from active direction of the journal to take up professional consulting practice. Mr. Hore is particularly interested in metalliferous ore deposits and his work will be to assist operators in determining the nature of ore deposits as development progresses. Mr. Hore is an expert petrographer, as well as a geologist, and when he joined the staff of the Journal he was instructor in petrography and geology at the Michigan College of Mines, as well as geologist in charge of work for the Michigan Geological Survey in the copper mining district of Michigan. Previously Mr. Hore had been instructor in pet-

rography at the University of Michigan, Ann Arbor; at Queen's University, Kingston, and at the University of Toronto, Toronto. He spent two summers in Northern Ontario prospecting and examining prospects. In 1906 he was one of Dr. W. G. Miller's assistants in mapping the Cobalt silver area. Since that time he has studied a very large number of silver and gold deposits in Northern Ontario. In Michigan Mr. Hore spent some time in the iron districts, though his special work was in the copper mines. In all the mining districts in which Mr. Hore has worked, the ore deposits are in Pre-Cambrian rocks, and it is therefore in Pre-Cambrian areas that he is particularly able to give assistance to mine operators.

Mr. Hore's long experience in editing the Journal, and his special knowledge of Canadian mines, will be retained for the benefit of our readers, as he will continue to be associated with the paper as Consulting Editor, and will from time to time contribute articles connected with the subjects in which he is particularly interested. As compiler of the "Canadian Mining Manual" Mr. Hore possesses a uniquely extended and intimate knowledge of the minerals and the operating mines of Canada.

Mr. F. W. Gray, who during the past two months has been Associate Editor of the Journal at the office of publication at Ste. Anne de Bellevue, will take the editorship. Mr. Gray has been a regular correspondent and contributor to the Journal since it absorbed the "Canadian Mining Review" in 1907.

MEMORIAL ON EDUCATION PREPARED BY A COMMITTEE OF THE ASSOCIATED TECHNICAL SOCIETIES OF CANADA.

Sir,—A committee representing the Canadian Mining Institute, the Engineering Institute of Canada, the Canadian Textile Institute, the Canadian Manufacturers' Association, and other industrial, educational and technical bodies as enumerated below has had under consideration for a year the pressing necessity for improvements in the education of Canadian children and youth in the direction of better training for citizenship and the general upbuilding of character. It is doubtless known to you that this subject is under earnest discussion throughout Canada by various organizations; all of which have so strongly felt the need for some change in our methods of education, that they have passed resolutions asking for various things including more technical education, more attention to the practical needs of our people, a better training for citizenship, etc. The Committee mentioned above has held a number of meetings and discussed the subject thoroughly. The conclusions reached may be summarized as follows:

1. It is of vital importance for the development of a Canadian nationality with high ideals, and efficient performance, that there should be an early and thorough training for citieznship in all schools throughout the Dominion. To be effective this training must be based upon the ordinary activities and occupations of the children and young people. The success of this method is well shown by the Boy Scout movement. Any attempt to teach the abstract principles of citizenship and moral conduct solely through text-books, notes, or lectures is sure to be futile. Children do not understand the abstract, but must be appealed to by the concrete. Fair play, honest dealing, courage, responsibility, co-operation, service, thoroughness and thrift can be inculcated in connection with games, gardening, carpentering, sewing, and other practical occupations, and also in the course of reading, and other lessons dealing with subjects in which children are interested.

2. The committee are of the opinion that compulsory education should be universal throughout Canada up to the age of 14 years at least. They beg to point out that illiteracy even in a minor degree is a great handicap, reducing the productive efficiency of the population, and tending towards the kind of degeneracy of which there are now painful examples in a number of the provinces. Illiteracy is a danger in another respect. It prevents that education of the people, which would be invaluable in any great crisis such as that at present exemplified in Russia. The masses in Russia cannot be reached because they cannot read. It is thus impossible to influence them as an educated populace can be influenced. They are an easy prey to demagogues. The question should also be considered whether some form of continuation education should not be compulsory for a further period of two or more years.

3. The best system is bound to fail in the hands of teachers who themselves may be undeveloped, and insufficiently educated in the direction required. To secure the desired results it will be necessary to pay the teachers larger salaries in order to make it worth while for the best men and women to devote themselves to the profession. It will also be necessary to give these teachers a better kind of training than they at present receive. This implies an overhauling of the various types of schools for training teachers and incidentally paying better salaries there.

4. Improvements in text-books would be advisable to make them interesting and more closely related to the natural knowledge and the ordinary activities and occupation of children and parents. This would open up the opportunities for character building and for the training in citizenship referred to in section 1. There should also be prepared text-books of special character such as those lately published by the United States Dept. of the Interior, Bureau of Education, and entitled, "Lessons in Community and National Life," The committee feels that in the reading and other books used in the schools great cars should be taken that the selection of readings and examples be within the apprehension of the pupils and that they include subjects of every day life.

5. The nature of the instruction should be such as to interest the children more deeply in the things around them and to give them clear ideas of Canadian citizenship and its responsibilities. The character of the illustrations used in teaching should be varied according to the activities of the community. In other words, the school room should be adapted to the interests of the community. The text-books should be supplemented by exhibits of manufactured articles, farm products, etc., and by excursions and lessons outside of the classroom. Schools should be provided in all cases with libraries, selected in part to fit the occupations of the people of the district.

6. The rural schools present special problems. Owing to scattered settlements in many parts of Canada it is very difficult to organize good schools. In the case of settled country a solution may be found in consolidation of small inefficient schools on well known

plans, but in the systematic and scientific planning of new settlements the school needs of the community should be carefully provided for. The committee has also reached the conclusion that larger school units are advisable and where possible the municipality should be the unit for school purposes.

All of which is respectfully submitted with the urgent request that this matter be given serious attention and remedial action undertaken.

NATIONAL CONFERENCE ON MORAL EDUCATION IN THE SCHOOLS IN RELATION TO CANADIAN CITIZENSHIP.

In common with the rest of the civilized world, Canadian communities have been profoundly impressed, through the revelations of the great war, with the necessity of emphasizing in the strongest possible way the educational activities that make for the formation of character and that tend to promote a high standard of individual and national life. While it is recognised that the ethical aim has always been present in the schools, it is well known that the diverse racial and religious elements of which our people are composed have hitherto made any attempt at organized moral education difficult. Misunderstandings, mutual distrust, inability to agree on content or method have prevented the co-operation necessary to effective action. It is believed, however, that many prejudices that formerly obscured essentials have disappeared as a consequence of the war and that the time is opportune for emphasizing the importance of character training as a preparation for citizenship. At the outset of the great struggle from which we have just emerged, the world was confronted with a people of some sixty millions thinking and feeling as one man in a conspiracy to subject the world to the domination of the German race. This unity of thought and purpose was the outcome of carefully planned and energetically conducted educational propaganda beginning in the elementary schools and carried on by university, church and press. If the energy of an entire people could be enlisted and directed by means of its educational agencies towards an evil purpose, it is believed that the same factors would be even more effective if set in motion for a righteous end. In this belief a number of gentlemen active in the professional, business and educational life in Winnipeg, resolved to come together to discuss the matter, and determine what action, if any, should be taken. On the invitation of His Honor Sir James Aikens, a meeting for this purpose was held at Government House and the progress of the discussion showed that all present were deeply interested, profoundly impressed with the need, and fully persuaded of the possibility of making a forward movement in education. It was recognized that any movement of the kind to be effective should be national in its scope and should command the interest and and sympathy of all the people in every part of the Dominion without distinction of race or creed. To ascertan the extent of which such interest existed or could be aroused, a central committee was organized. Five gentlemen undertook to contribute one thousand dollars each for preliminary expenses and steps were then taken to present the matter to groups in the larger cities throughout Canada. Some forty cities and towns were covered, and local committees formed. Without going into detail, it may be sufficient to say that great interest was manifested at every point and that the various discussions led to the determination to call a national conference to discuss the question of moral education and training for citizenship. The purpose of the conference is to stimulate public interest so as to accentuate character training in the schools and other institutions. It is further hoped that one of the outcomes may be the establishment of a foundation for the study of the whole problem, the result of this study to be made available for educational workers everywhere.

The Rotary clubs undertook the finance and the necessary funds are in sight for the holding of the conference. The sum of $70,000 has been pledged for the purpose. It is planned to hold the conference at Winnipeg on October 20th, 21st and 22nd, 1919.

The Finance Committe consists of Rev. E. Leslie Pidgeon, Past International President of the Rotary Club; Sir James Aikins, W. J. Bulman, President Canadian Manufacturers' Association; H. W. Wood, Calgary, President Canadian Council of Agriculture; and N. P. Lambert, Secretary of the same organization. The Chairman of the Programme Committee is Chief Justice Mathers. Sir James Aikins, Lieutenant-Governor of Manitoba, is Chairman of the Convening Committee at Winnipeg, and His Excellency, the Duke of Devonshire, the Governor-General of Canada, has graciously accorded his patronage to the Conference and has consented to be present.

The trouble with the engineer is that, in general, he has received a great deal of instruction and not enough education. Mr. William Maurice lays stress on this point in a well-reasoned paper on "The Education of Colliery Managers for Administrative and Social Responsibilities." which he read recently before the Institution of Mining Engineers. In his opinion, "the daily round and common task of the colliery manager is not so much to direct the inanimate forces of Nature as to guide and control those infinitely more complex living forces which find their expression in the mind and spirit of man." This appears to be a fair statement of the case, and it would apply with equal force to all engineers holding responsible positions. Yet there are engineers who would persuade us that the time and money spent by an engineering student in acquiring a general education are wasted, as witness the following quotation from a paper on Engineering Education which appears in the July number of a well known publication: "Education . . . seems to be something which might well be an afterthought, a post-graduate course, and something that should not be paid for by the rank and file whose aspirations stop with doing engineering." If such a doctrine were approved and adopted by the engineer, his case would be hopeless indeed. It can hardly be doubted that if our engineers had a broader training in the humanities and in the principles of citizenship and were imbued with the essential elements of "sociology," they would approach their life's work with an entirely new outlook, and one of the causes which lie at the roots of so many industrial disputes would be removed.—C. M. I. Bulletin.

The Huntingdon Copper Mine, Quebec

By REGINALD E. HORE.

In company with Mr. Fred M. Connell, president of the Eastern Mining and Milling Co., Ltd., I have recently visited the Huntingdon copper mine near Eastman, Quebec. From my observations and from information supplied me by Mr. Connell, I believe it probable that the operation of this mine as planned by the present owners will prove a profitable venture. The recent strengthening of the market for copper should encourage the operators to proceed with their plans without delay. Readers of the Journal may be interested in some account of the property, the recent operations and the plans for the future.

When Mr. Connell and his associates took over the property there was on the dumps about 50,000 tons of ore averaging about two per cent copper. This material had been discarded by the former operators whose methods of treatment were suitable only for high grade ore.

Ore Dumps, Huntingdon Mines

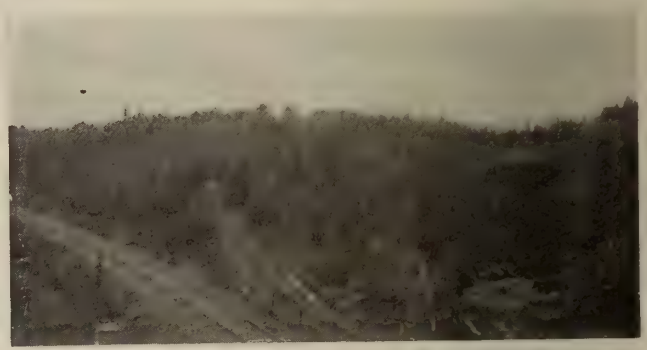
The new owners had experiments conducted at the General Engineering Company's testing laboratory at Ottawa and it was found possible to treat the ore successfully by the oil flotation process. A 100-ton oil flotation plant was then installed in the building already on the property. A tramway was constructed from the dump to the top of the mill. An electric transmission line was constructed from the mine to Eastman, connecting with the main transmission line of the Southern Canada Power Company. A contract was entered into with the company for the necessary power at $37 per horse power per year. A railway siding was constructed. Exploration was conducted on the surface and a tunnel was driven to cross cut the ore-body. The concentrator was completed in October, 1918, and up to the first week in February, 1919, about 6,000 tons of the ore on the dump had been treated. Twenty-six car loads of concentrate were shipped to the Nichols Copper Co., Laurel Hill, Long Island, New York. Very satisfactory results were being obtained when the great break in the price of copper made production inadvisable. During the first half of 1919 the plant was idle, but operation has been recently resumed.

The price of copper is fast rising toward that which prevailed in 1918. Copper producers, having taken their losses, seem likely to find a good demand for the product from now on, and the Huntingdon resumes production at what seems to be just the right time.

During the operations all parts of the dumps were carefully sampled and ore drawn from many places for the mill. It was found that nearly all the material on the dumps is ore that can be profitably treated by the oil flotation process. Evidently the former owners shipped only high grade ore.

The Property.

The accompanying photographs show the mine to be very conveniently located on a railway. The railway is a branch line of the C.P.R., and was formerly known as the Orford Mountain railway. It crosses the Sherbrooke branch of the C.P.R. at Eastman; but, owing to a difference in grade at Eastman, connection is made a mile west of the town at Eastray. The Orford Mountain line gives connection with North Troy at the south. Windsor Mills is the north-eastern terminus of the branch. Eastman is about 80 miles east of Montreal. The Huntingdon mill is about 3 miles south of Eastman.



Looking North from Dumps at Huntingdon Mine.

At the mine the railway traverses ground that is probably underlain by serpentine. On the west is low ground, the valley of the Missisquoi river. On the east the ground rises sharply. Close to the railway is ore deposit. On either side of the railway are dumps of ore discarded by the former operators. From near the railway a tram line runs up to the mill, the top of which is visible from the track.

On the property, which consists of 409 acres, there are several good buildings. The mill building is large enough to house the proposed 250 ton plant. Other building provide sleeping quarters and cook-camp for the men, office and residence for the manager, store house, power house, blacksmith shop and stables.

While the immediate vicinity of the mine is rugged country, there is close at hand a well developed farm-

ing area. There are in addition to the exceptional railway facilities some very fair country roads, one of which runs directly from the property to Eastman. The cost of transporting supplies to the mines will obviously be, as compared with many mines, relatively low. The close proximity of the village will also permit of mine workers residing there if they wish to do so. Those who have undertaken to develop mines in out of the way places will appreciate the advantages enjoyed by the operators of the Huntingdon mine. There are also the favourable conditions common to many of our Northern camps as regards fuel and water. There are many trees on the property suitable for mine timber, as well as a plentiful supply of wood suitable for fuel. The Missisquoi river runs across the property a short distance west of the mine, affording a plentiful supply of water. Electric power sufficient for the proposed plant is already provided for.

The Ore Deposit.

The Huntingdon ore deposit is a well mineralized mass of greenstone which strikes in a northerly direction across the property. On the west of the ore deposit there is grey and green massive serpentine. On the east there is a grey schistose rock. A few feet east of the main ore-body there is a thiner ore deposit in the grey schists.

In the main ore-body, chalcopyrite is liberally sprinkled through the dark green chloritic rock. It occurs in small particles and in sulphide masses. A considerable quantity of pyrrhotite accompanies the chalcopyrite, especially near the footwall side of the deposit. Quartz occurs in veinlets and irregular masses throughout the ore-body, and there is commonly chalcopyrite in the quartz, the mineral being in small particles enclosed in the quartz. Solid masses of sulphides rich in copper and several inches in width form a part of the larger ore-body. In the former operations attention was evidently directed chiefly to the development of these portions, the remainder being too low grade for the then available methods of treatment.

An adit driven a few feet about the base of the hill shown in the accompanying photograph traverses a few feet of serpentine and then 48 feet of ore which averages 3.7 per cent copper. The face of the adit is in a soft grey schist. From surface observations it is expected that more ore will be encountered when driving is continued, the east lode being separated from the main deposit by several feet of grey schists.

Method of Treating the Ore.

To handle the ore from the dumps, a tramway has been constructed from the dumps to the ore bin at the top of the mill building. The ore is trammed in 1,500 lb. cars to the loading station at the tramway and then hoisted in a 2-ton skip. The filling and emptying of the skip is done automatically.

The ore passes through two jaw crushers and is then ground to about 50 mesh in a 6 ft. Hardinge mill. A Dorr classifier returns the coarser product to the mill. The pulp passes to Callow rougher cells and then to a cleaner cell. The concentrate is then allowed to settle in concrete tanks. It is then dried in the tanks by steam and shipped in bulk in case to Long Island smelter. The concentrate averages 12 per cent copper.

Results Obtained.

From the ore treated, concentrate containing 200,910 lb. of copper has been made and shipped to the smelter. The concentrate shipped weighed 1,753,395 lb. The dry weight was 1,698,006 lb. The average copper content was about 12 per cent.

Recovery from ore taken from the dumps was about 80 per cent. From freshly mined ore a recovery of 90 per cent is expected.

View of Power House and Mill.

A View from the Railway, Huntingdon Mine.

From the results of operation of the plant and from sampling of the ore the operators believe that in treating daily 250 tons of ore averaging 2.42 per cent copper the monthly operating, smelting and other charges would be about as tabulated below when the price of copper is 15 cents per lb. With higher copper prices the smelting charges are higher.

Milling 6,500 tons at 87 cents per ton	$5,655
Mining 6,500 tons at 95 cents per ton	6,175
Freight on 884 tons concentrate at $6 per ton	5,304
Smelting loss on 884 tons concentrate at $3.90 per ton	3,447
Smelting charge on 884 tons concentrate at $3.00 per ton	2,652
Refining charge on 884 tons concentrate at $4.41 per ton	3,898
Cost of selling concentrate at 88 cents per ton	778
Assaying charge on concentrate at 20 cents per ton	177
Miscellaneous charges, 10 cents per ton	88
Total cost per month	$28,175
Selling price of 263,140 lb. copper at 15 cents	42,471

At the time of writing, copper is selling in New York at 23 cents per lb. It seems very likely that there will be a big demand for the metal from now on. The operators had confidence that with a plant of 250 tons capacity they would be able to operate successfully with copper selling at 15 cents per lb. Now that a much higher price is available the success of the enterprise seems assured.

Future Possibilities.

In addition to the knowledge that there is at or near the surface a tonnage of ore available that will permit of steady operation of the proposed plant for many months, there are indications that development will prove the ore deposit to be a very large one. I spent only a few hours at the property, but from what I could see in that time I concluded that the Huntingdon ore deposit is a really big one. A series of flat diamond drill holes would help to determine the length of the deposit and its thickness at intervals. The mine workings are doubtless in the richest part of the deposit. The surface exposures and dumps indicate that the workings are almost entirely in ore of a grade that can be profitably treated by the new plant, even if the higher grade portions have been removed. I have little doubt that there is more ore in the unexplored areas north and south of the known ore. To determine this, exploration is necessary. I do not expect that the deposit will prove to be as wide or as rich in the undeveloped portions, for there are indications that such is not the case; but I do expect that exploration will prove the deposit to be a very large one.

That the Huntingdon ore can be profitably treated at the present prices and by the method now in use seems to have been satisfactorily demonstrated. There is also a chance that the mine may become a very large producer. If the deposit hold its width and values to any great depth, as seems quite probable, it is a big one.

There is a high degree of certainty that the ore in sight can be profitably treated. There is no certainty concerning what cannot be seen and sampled, but there is a very good chance that further exploration will disclose a large tonnage of ore. Mr. Connell, to whom I am indebted for all my information as to the results of sampling and of treating the ore and disposing of the concentrate, is an experienced mining engineer of good standing, and I have confidence that the information which I am here passing on to readers of the Journal is reliable.

U. S. COURTS DECIDE THAT TRADE UNION IS RESPONSIBLE FOR MEMBERS' ACTS.

The most important decision affecting the responsibility of labor unions and the first instance in the United States where a labor union had been held liable for damages for an act of its members is that recently rendered by the United States Circuit Court of Appeals for the Eighth Circuit in imposing against the United Mine Workers of America damages to the amount of $625,000 for violation of the Sherman Anti-Trust Act. Three essential principles are established by the decision.

First.—That a labor union is responsible under the Sherman Anti-Trust Act for treble damages for injury or destruction of property by its members.

Second.—That the organization is responsible as a principal for the acts of its district and local branches or their officers and members.

Third.—That the organization is responsible when it takes no steps to control or discipline its officers and members for acts of violence.

BOOK REVIEW.

Mining Engineers' Handbook, Robert Peele; 4¾ x 7 x 2½ inches. John Wiley & Sons, Inc., New York, Chapman & Hall, Ltd., London, 1918. Price $5.00.

We bring this handbook to the attention of our readers, believing that it is not as yet sufficiently well known in Canada. Under the editorship of Robert Peele, Professor of Mining Engineering in the School of Mines of Columbia University, a staff of specialists has prepared a veritable encyclopedia of that extremely varied and composite of pursuits, namely, mining engineering as practised today.

Not since the time of Georgius Agricola has any single person essayed to write a volume descriptive of the whole art of mining engineering, but Professor Peele, by combining the labours and experience of men who are acknowledged leaders and specialists in their chosen branch of mining engineering, has well night accomplished such a volume.

The volume contains 44 sections, and the best idea that can be given of the scope of the work is to quote a partial list of the sections and their writers, as follows:—

Mineralogy, by Prof. Alfred J. Moses, Columbia.

Geology & Mineral Deposits, by Prof. J. F. Kemp, Columbia.

Earth Excavation, by H. P. Gillette.

Tunnelling, by David W. Brunton & John A. Davis.

Mine Geologic Maps and Models, by Reno H. Sales, Geologist to the Anaconda Copper Mining Co.

Mine Organization & Accounts, by J. R. Finlay, and Cost of Mining, by same author.

Mine Air, Hygiene, Explosions and Accidents, by George S. Rice, United States Bureau of Mines.

Mining Laws, by Horace V. Winchell.

Ore Dressing, by the late R. H. Richards.

Each of the sections is fully detailed in itself, for example, the Section on Mineralogy contains 116 pages, and includes a bibliography of the more important books and papers relating to the particular subject covered.

A set of mathematical tables, and a full index complete the volume.

The book will not only be useful to the mining engineer, but also to the lawyer and other men requiring reliable information regarding mining in all its branches. The arrangement of the book into sections, and the full index make reference easy. "Peele" will doubtless take its place as a standard work of reference along with other well-known engineering handbooks, and we do not see how any student of mining can afford to be without it. The volume contains 2,375 pages, but is surprisingly handy, considering the wealth of its contents. The bibliographies add greatly to the reference value.

A number of changes have recently taken place among the officials of the Dominion Coal Company's collieries at Waterford. Bart. Connors, Manager of No. 14 Colliery for the past ten years, has retired from that position and has been appointed Coal Inspector of the Waterford District. W. D. Haley, formerly Manager of No. 17 Colliery becomes Manager of No. 15, and his place at No. 17 is filled by J. P. McIntyre. Mr. H. A. Macleod is appointed Manager of No. 14 Colliery.

Asbestos Mill of the Asbestos Corporation of Canada, Ltd., Thetford Mines, Quebec

Preliminary Steps in the Development of a Graphite Deposit--II.

By CHAS. SPEARMAN.

Probably no other branch of mining offers a wider field of general investigation than that of graphite and the many failures in this industry may be attributed in the majority of cases to venturing without accurate preliminary knowledge of its various subdivisions such as the nature of the deposit, the mining, the refining, the uses, the marketing, etc.

The value of a graphite deposit depends firstly upon the physical and chemical properties of the contained graphite; secondly, upon the tonnage and tenor of the ore available for milling purposes; and thirdly upon the process of refining and the market.

Graphite differs from most minerals in that an average assay sample from a deposit may on analysis show a high content and yet the deposit may have a relatively low value when measured by the physical properties as standardized by the consumer. The bulk of graphite marketed goes into the manufacture of crucibles and this grade commands the highest price, and the consumer specifies that the stock shall have a moderately thick flake, shall pass through a standard 16 mesh screen, at least 50 per cent shall pass over a standard 50 mesh screen and the whole shall pass over a standard 90 mesh screen and in addition shall contain at least from 85 per cent to 90 per cent or more graphitic carbon and shall be free from such impurities as lime, iron, mica, sulphur, etc. The foregoing specifications eliminate all the finely flaked or so-called "amorphous" graphite from this particular demand and classifies it with the lower grades of graphite with which the market is usually stocked and for which consequently prices are very low. It is, therefore, important that the deposit shall contain distinctly flaky graphite and that the flakes are not too thin and of such dimensions that all or practically all shall be larger than that set forth in the specifications of the consumer of the higher grades. The higher the graphitic carbon content of such a deposit, the more valuable the deposit.

The quality of the graphite of a deposit should be considered from the chemical as well as from the physical standpoint, for if the flake be intimately interlaminated with very thin plates or scales of a micaceous decomposition product or other impurities the grade of the refined graphite may be low if subjected to ordinary ore-dressing just sufficient to liberate the composite flake from the surrounding gangue, and any attempt at further refining may have the desired effect chemically, viz., to raise the graphitic carbon content, but at the expense of lowering the grade physically by creating a thin flake. This thin-flaked refined stock causes a further increase in volume per unit mass of the refined flake and thus renders it less suitable for the purpose of crucible manufacture, and in addition the extra refining usually creates an abnormal quantity of fines or low-grade stock. There are exceptional cases where this enclosed foreign matter has been noted to run as high as 10 per cent. It would be almost impossible to successfully treat ore from such a deposit in order to produce gold crucible stock as it would mean the elimination of all the remaining impurities. As a rule Canadian graphite flake is remarkably free from such interstratified impurities. The writer has had several analysis of flake from well known Canadian deposits and has not as yet found flake wherein the involved impurities exceeded 1.10 per cent, although a great many flakes contain coarse interlaminated marginal impurities such as pyrite, quartz, calcite, etc. Those impurities penetrate laterally into the jagged margin of the flake but a relatively short distance, and are practically all removed by proper ore-dressing methods without serious injury to the flake. (See fig. 1.)

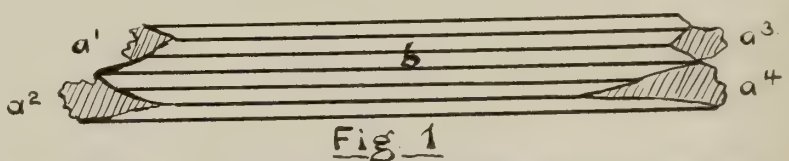


FIG. 1.—a^1, a^2, a^3, a^4 Represents Marginal Impurities Penetrating the Flake b.

A study of the nature of the occurrence of the graphite of a deposit is also an important factor in the determination of the value of a deposit. As a rule the best flake occurs in the softer gangues such as crystalline limestone, schists, etc., or in fissure veins containing little else than graphite and formed apparently under pneumatolitic conditions such as the Ceylon deposits. Much of the flake in the hard gangues such as quartz, etc., is thin and more apt to disintegrate in the process of refinement, while the flake in the softer gangues may be liberated with the minimum injury to the flake. Some of the best Canadian deposits occur in the above mentioned soft gangues and are designated as "disseminated" flake graphite deposits and usually contain from 5 per cent to 20 per cent graphitic carbon. In excess of 20 per cent the flake appears to become crowded and smaller and loses the characteristic uniformity of size and the ratio of crucible stock to the whole graphitic carbon content falls off very rapidly. A fair average graphitic carbon content for an ideal deposit such as the above would be between 10-12 per cent.

Another feature which contributes to the value of a graphite deposit is the percentage of good crucible stock that may be recovered from the ore. A mill may be designed to affect a complete extraction of the graphite content of the ore yet in the dressing of the ore for such extraction the flake is so impaired that a relatively small proportion of the whole is recovered as the best grade. The measure of efficiency of a graphite mill is therefore not the extraction altogether, but for comparative purposes may be designated as follows:

$$\frac{\text{Weight. of graphite recovered as No. 1 crucible stock from ore treated}}{\text{Total weight of graphitic contained in the ore treated}}$$

calculated as a percentage, and the value of a deposit varies directly as the efficiency of the mill. It is therefore very important before constructing a mill to select the most efficient process for the particular ore by submitting representative samples for mill test to the various types of concentrating machines.

A certain process may recover a fair percentage of stock that will pass over a standard 90 mesh screen anl analyze 90 per cent plus graphitic carbon and apparently resemble good crucible stock, but due to over-refining in order to raise the graphitic carbon content the stock will not classify as good crucible stock on account of failing to meet the mass-volume test.

Most Canadian deposits may be developed quickly and cheaply to a certain point by means of the core drill. This preliminary development work, which is more of the nature of determining the structural geology of the deposit may give valuable information such as revealing large possible tonnages of ore, and thus directing subsequent mining operation, or may reveal conditions which would discourage further expenditure for development. A fair approximate net value of a deposit may be calculated from the above preliminary steps if accurately followed and a fair safety factor carried in each step when applied to the deposit as a whole.

NORTHERN ONTARIO.

The Cobalt Strike Situation.

Outwardly, the visitor to Cobalt would scarcely know that a labor strike is in full swing. The only visible evidence is the large number of men who may be seen idling about the streets in groups. Outside the town, however, the change is more notable. Here almost complete silence reigns.

A rather disquieting situation developed when it became known that the watchmen at a number of the mines had been taken from their posts by members of the Union during the night. In some instances an arrangement has been made that the mining company may hire a watchman, provided also that one Union member shall also remain on picket duty.

Up to the time of writing the public utilities had not been interfered with, although the power plants of the Northern Ontario Light and Power Company have all been closed with the exception of the Matabitchoun plant, where some 10,000 h.p. is generated. The public utilities, including the Nipissing Central Railway depend upon this plant for electric energy.

All the neutral influences are being brought to bear an effort to bring about the resumption of work at the mines.

Porcupine Situation Harmonous.

In the Porcupine district the labor situation appears to be exceedingly favorable, a situation in sharp contrast to Cobalt and Kirkland Lake. Such is the impression gained as a result of a visit to the camp and a careful discussion with mine employees and a number of the managers of the mines. Not since 1915 has there appeared to be such abundant reason for optimism over the general outlook in the great gold camp. Also, never before in the camps history were so many men employed at the mines of Porcupine.

As a result of exercising the utmost mutual consideration, the men and the managerial staffs are found to be working together in a manner that appears likely to last. The spirit of co-operation is abroad and its actual application will be intensified as time goes on. The situation is perhaps without parallel in any of the mining districts of the North and speaks for the sane judgment of all concerned.

Work at the mines is going on space and each day less difficulty is experienced in securing men. The Hollinger Consolidated alone has about two thousand men employed, the largest number in its history. The McIntyre-Porcupine has close to four hundred men on its pay-roll.

Official advice is that co-operative stores whereby it is hoped to reduce the cost of living about eighteen per cent below that obtaining during the past twelve months will be put in operation with the least possible delay. It is proposed to operate the stores independent of the mine, having an experienced and efficient man in charge so as to give the employees the full benefit of every possible saving.

Also, the plan to insure men half-pay during time which they may lose due to illness is to become a reality, it is learned officially. Thus, in Porcupine, the foundations of future harmony are being laid. With such able men as A. F. Brigham, R. J. Ennis and C. D. Kaeding working together toward this end and with the good-will of the great body of men engaged. there appears to be every reason to believe that the Porcupine gold area is already rising above the stormy and tempestuous period of re-construction, in a manner that might well prove to be the criterion of other mining areas in the Dominion.

From other districts where labor strikes are in force there has gone out to Porcupine a few men whose chief efforts are stated to be directed toward disturbing the present harmonious situation. Good judgment on the part of the men, it is confidently expected, will withstand the adverse outside influence, and, instead of disrupting mining operations, the effort of the "drifters" may still further consolidate the Porcupine men into a great and lasting co-operative body.

Progress of the James Bay Railway Survey.

The survey party which was sent north last spring for the purpose of looking into the possibilities of extending the Temiskaming and Northern Ontario Railway from Cochrane to tide water at James Bay is making satisfactory progress and is understood to have covered over one-half the total distance of not far under 180 miles.

From present indications some more or less serious obstacles have been encountered in the form of muskeg and in some places large stretches of territory where layers of moss occur sometimes several feet in thickness, and through which road-building would be quite difficult. For the first seventy miles the country is understood to present no serious obstacles, but beyond that point the muskeg and the moss-covered areas are extensive.

As to just how serious the difficulties may prove to be cannot be intelligently estimated until the completion of the survey, although already enthusiasm has grown less pronounced than was the case earlier in the year.

The James Bay survey expedition has experienced considerable hardship during the early stages, including two drowning fatalities and a number or less

serious injuries to members of the party, who had to be taken back to the railway. However, the work is being continued unremittingly, and by the close of the current year the feasibility of a railway to the sea and a seaport for the province of Ontario will probably be known.

That the building of the road would not be impossible is already known, but it is not yet determined whether or not the estimated cost of construction would prove to be within reason as compared with the expected advantages accruing therefrom.

Operating News.

The dividend of one per cent, declared payable August 12th to shareholders of the Hollinger Consolidated Gold Mines of record July 31st, will call for the distribution of some $246,000, and will be the fourth of like amount to be paid this year, or a total of $984,000. By the end of the current year the company is expected to be in a position to increase the rate of to double the present amount by disbursing one per cent every four weeks instead of every eight weeks as at present.

Since going on a dividend paying basis the dividends paid by the Hollinger total some $9,264,000.

A contract has been let for six thousand feet of diamond drilling on property held in the townships of Tisdale and Whitney by the Northwoods Gold Mining Company. One drill is stated to be already at work.

Interest in control of the Hill Gold Mines, in the Munro township area are stated to be negotiating in an endeavor to secure control of the adjoining Gold Anchor property.

The Mining Corporation of Canada, one of the important silver producing companies of the Cobalt district, is becoming quite active in the silver area in the Port Arthur district. It is stated that a small shipment of ore has been made from the West End mine, which is being worked by the Mining Corporation. It is also stated that the company is looking into the possibilities of such old properties as the Badger, Porcupine, Keystone and the East End.

The Port Arthur district yielded considerable silver during the latter part of the nineteenth century, some of the ore being exceedingly rich. It is believed possible that the more efficient mining methods of the present day may result in once more placing certain of the old properties on a profit producing basis.

Progress at the Clifton-Porcupine mine, in the Porcupine field is understood to be exceeding expectations. A contract for drifting has been given to some of the employees of the company, and the work is being carried forward rapidly and at a cost somewhat less than that incurred heretofore.

More than usual interest attaches to the operation for the reason that a number of neighboring properties would take on added value should the development of the Clifton Porcupine continue so favorable as is now the case. The operation is recognized as one of the most efficient for its size in this country.

THE ASBESTOS INDUSTRY IN QUEBEC, CANADA.

The most productive asbestos region in the world is in the neighborhood of Thetford Mines and Black Lake in the Province of Quebec, Canada. Though the output was somewhat curtailed through lack of export trade during the war, prices have greatly advanced and the industry has prospered. About 14 companies are now in operation in the district, and several of them operate two or more quarries.

The rock is excavated almost exclusively by open-pit quarry methods, the small amount of tunnelling done being chiefly for the purpose of obtaining more direct and convenient transportation lines. The rock is drilled chiefly with air-operated tripod drills, and is shot out in benches about 16 feet deep. The larger masses thrown out by the primary shots are block holed, jackhammers being used for this purpose.

The crude fibre occurs in irregular veins scattered through the rock mass, and constitutes the most valuable product. In all quarries producing crude fibre hand loading of quarry rock is a necessity, as the crude must be sorted out by hand. A few quarries producing little or no crude employ steam-shovel methods of loading.

Most of the rock is removed from quarries by overhead cable-way hoists. A recent development in rock transportation consists in the projection of inclined tunnels through which the rock is hauled on cable cars.

The crude fibre is "rough cobbed" in the quarry to remove most of the adhering rock. It is then taken to cobbing sheds where it is hammered and screened to free it of all rock impurities, and it is then shipped without milling. Rock containing fibre veins less than half an inch in width is milled to separate the fibre. Briefly, the milling process consists in crushing and hammering the rock, separating the fibre by air suction and screening, and grading the product into various classes depending on the fibre length.

There is no prospect of a shortage of fibre for all prospective needs. Present plant capacity is sufficient for normal requirements, and the industry could be readily expanded as there is evidently a very large reserve supply of asbestos-bearing rock. Core drilling has shown good fibre-bearing rock at a depth of at least 700 feet below the surface, and it may continue to a very much greater depth. As an indication of the possibilities of development in the region it may be noted that within the past year a new quarry has been opened in the Coleraine district about 10 miles from Thetford mines. The rock contains an exceptionally large proportion of crude and mill fibre, and the deposit is undoubtedly of large extent. — Oliver Bowles, from June Report on Minerals Investigation, United States Bureau of Mines.

"THE CANADIAN INSTITUTE OF MINING AND METALLURGY."

As a result of the recent balloting the Institute will in future be known as "The Canadian Mining and Metallurgical Institute," or "The Canadian Institute of Mining and Metallurgy," as the Council shall determine. At present a majority of our members are miners. By their vote favoring the change of name, they have paid a graceful compliment to their fellows of the allied profession of metallurgy, and at the same time have fittingly expressed their recognition of the important position now occupied by the metallurgical industries in Canada.—C. M. I. Bulletin.

Old Mines of Western Newfoundland

By E. D. HALIBURTON, Port-au-Port, Nfld.

Newfoundlanders have so often heard Newfoundland spoken of as one of the richest mineral countries in the world, yet undeveloped, that they usually accept the statement as a matter of course; but they are appallingly ignorant, as a whole, of any real knowledge of the mineral possibilities of this island. It is that lack of knowledge which induces our moneyed men to invest rather in the mines of other countries. They welcome the success of any local venture, but they have too little faith in our minerals to back mining enterprises financially and to the want of capital, the undevelopment of the country must be attributed.

In this article I shall deal with mines which have been exploited, rather than worked, on one section of the West Coast alone.

The possibilities of the oil areas on the West Coast have never been really tested. About twenty years ago a company, called "The Western Oil Company," was promoted in New Brunswick to develop these areas and a man named Bell was given a contract to bore, at Shoal Point, in Port au Port Bay, on the north side of the harbor of Picadilly. Oil was struck at eight hundred feet and five or six well were sunk to that depth, the best of them flowing about four barrels a day. But the strike was not rich enough to save the company which, its capital exhausted, abandoned the project, and the pipes are there today, still filled with the oil which is used by all the fishermen around as lubricating oil for their motor boats.

In 1908 an English company sent an oil-expert to to same place, with six Londoners who were supposed to have been accustomed to drilling. These men bored to a depth of three hundred feet beside a well of eight hundred feet and of course got no result. The outfit used an old fashioned drill and appliances more antiquated than those used by Bell years before, and the expert is said to have had no control over his helpers who stopped work when they felt so disposed, to drink tea or to go swimming or read the newspapers as fancy willed, and so accomplished little work. This attempt was begun in the winter and many difficulties had to be overcome as a consequence. Instead of bringing their machinery to the spot by boat, as they might have done a little later in the season, they had it come by train to the nearest station eight and twenty miles away, hauling it ten miles across the bay on the ice.

The company in England, considering that the expenses of operations were too great, sent the outfit somewhere else, so they loaded their machinery aboard a schooner in Piccadilly and sailed away. But the expert went away very unwillingly, he had studied the formation of the country closely, the strike and dip of the shales on the opposite sides of the bay, and he was convinced of the existence of unlimited quantities of oil anywhere in the bay at a depth of two thousand feet, for in his opinion it was ideal country.

About the oldest attempt to work a mine on the West Coast, then, the French having certain rights of curing fish and certain jurisdiction over it, called the French Shore, was a venture of those pioneers among Newfoundland mining men, Messrs. McKay and Bennett, whose names are still connected with many of our mines. At that time McKay was manager of the Anglo-American Telegraph Company, which owned as they do still, large tracts of land in various parts of the island. In 1873, the Anglo-American people sent out Captain Andrew Harvey and his son, to prospect on land owned by them on the Western side of Port au Port Bay. These men prospected all summer without success and in the fall set out on their return journey to St. John's. They crossed a cove near the isthmus when the tide was very low and Capt. Harvey, walking out to the waters edge along the ledges on one side of the cove, noticed some gleaming metal which he took for galena; but on closer examination he found that he was standing on a lode of pure lead. They blasted out a specimen, boxed it and brought it to St. John's. The lump weighed four hundred pounds and proved to be 75 per cent pure lead with enough silver in the residue to pay for working the mine.

The company determined to work their property and men were sent on to build the necessary houses and stores in readiness for the next spring. The following year, a schooner left St. John's bringing men and supplies, and immediately upon her arrival at the mine, which was called Lead Cove, operations were begun, under the management of the Harveys.

Thirty men were employed. They sank a shaft on the beach just above high water mark, and at the foot of the cliff, then tunnelled in the cliff about thirty feet and sunk another shaft, tunnelling north from the bottom. Every earlier indication of an unlimited quantity of the metal was supported by the result of these workings, and the quality uniform, with that of the original lump taken as a specimen. For three years work was continued and hundreds of tons of ore were mined and piled on the beach behind a breakwater, built to prevent the sea washing it away. Before this mine had been three years in operation its existence was discovered by the French, and being so near the sea, was within the limits over which they had rights and one morning a French man-o'-war appeared off the cove and ordered the mine shut down. At that time there was much enmity between the French and English, who were always in dispute on this coast, and the Harveys refused to stop working the mine. A second warship, and a third bringing the Commodore of the French squadron appeared, to no purpose. Not daring to use force the French complained to the English cruiser further down the coast. This cruiser was the only law and order enforcing instrument recognized by the British at that time on the coast, for there were no representatives of the law on land, and English laws applied to the English, and French to the French, so the English cruiser came and put a stop to the mine. The place was deserted and hundreds of tons of ore, the result of three years labor, left to the mercy of wind and tide, which soon scattered it over the bay.

Forty-five years ago, when prospecting up Robinsons River, Harvey found a four foot seam of coal, dipping at an angle of forty-five degrees, and striking diagonally across the river to be lost in the woods on the other side. They paid little attention to it as coal was then of little value. The party camped beside this seam for the night and building a fire, heaped huge piles of coal over it so that it burned all night and

kept away the flies which had previously bothered them. Years later when one of the party tried to locate the same spot it could not be found; a landslide had covered over the outcrop. Many coal seams have been relocated in that vicinity during the past few months. Higher up the river the prospecting party referred to, found many huge boulders of hematite, pointing to the existence of a deposit of iron in the neighborhood, but as iron also held little attraction for them they wasted no time looking for it. Coal and iron, the latter containing a trace of titanium, are now known to exist in large quantities on the Eastern side of St. George's Bay, and the whole of Port au Port Peninsula on the opposite side is composed of limetone, all the essentials, including a harbor in the centre, for creating a great industrial community within a radius of twenty miles. At Indian Head, in the bottom of the bay, a deposit of magnetite containing a large percentage of metallic iron, was discovered a few months ago. Just prior to the outbreak of war, an American lady, calling herself a doctor, became interested in this ore and brought down some men from New York with drilling machinery, ostensibly to learn the size and value of her claim. They did no work, however, and on the outbreak of war the whole outfit vanished and nothing has been heard of them since, the circumstances were so peculiar at the time that the peo ple around universally concluded that she was a spy.

The most interesting mine on the West coast, the scene of many attempts, and as many failures, is the chrome iron mine at Bluff Head, the entrance to Port au Port Bay. About fifty years ago a man named Holden was sent from St. John's to open up this mine in the fall and he had huts, stores, and stables erected and a few miners employed. These few miners were working but a few months when winter and disaster overtook them. The mine was nearly up to the top of the mountain, which formed one side of the gulch terminating at the bottom in Bluff Head Cove. The huts where the men lived, were built on a sort of terrace about half way up this mountain and to get to the mine they had to traverse a path that curved around and upward. The miners were four in number and one morning these men left the huts to shovel a path to the mine. When half way across the snow began to move and unable to save themselves three of them were swept away in a gigantic snow-slide; the fourth happening to be the last man and furthest from the centre of the slide, was carried down the mountain for two or three hundred feet but escaped with his life.

One of the men who was swept away was Holden's brother, and after this accident, the company abandoned the mine. But another company, calling themselves the Halifax Chrome Company, took it over. This company, under the management of a man named Leewald did a good deal of work; as many as sixty men were employed, a crusher was installed, and thousands of tons of ore mined, crushed, and ready for shipping. But when the company had reached what would been the red-letter day of its history, it received a big check. A big cargo tramp which came to take away a load dismayed at the appearance of the coast, refused to anchor there and steamed on into the bay, and smaller craft had to be employed to load her, doubling the expenses. Eventually shipping difficulties caused this company also to give up the idea of working this mine.

The wind sweeps down the mountains and gulches with terrific force, but despite all the disadvantages of locality, possessed by this mine, it is being continually "considered." It must wield some unknown attraction over visiting prospectors. The latest failure was an undertaking of two young Americans, brothers, from Oklahoma. They took an option on the mine, and undertook to ship the ore across the straits to Sydney, where they could get seventy dollars a ton for it; all the ore they could have shipped in one season was mined and ready for shipment. They had the chance of a lifetime to make money, but their attempt went the way of the others, although under good managemnt it could hardly have failed.

The country around Bluff Head is rich in many minerals. The Louis Hills and the Blue Hills are rich in asbestos, and gold has also been found there. Lumps of malleable native copper occur in many places.

OIL NOTES.

Anglo-Persian Oil Company Ask for Extensive Oil Rights in the Peace River District.

Whether the Government of British Columbia should grant a very extensive prospecting license in the Peace River district to the D'Arcy Exploration Company, and accept a royalty of 12½ per cent net on whatever output the company might succeed in obtaining, or whether the Province should hold these rights, prospect the territory at its own expense and keep control of the entire output, was the question upon which the Board of Trade, at its regular quarterly meeting recently was asked to express an opinion. It was decided to refer the matter to the council for consideration.

Charles F. Law explained the objects of the D'Arcy Company, which he said was backed by the British Government. If oil were found they were prepared to pipe it to the Pacific Coast, where it would be available for naval and mercantile vessels. It was the object of the British Government, he said, to develop as extensively as possible the oil resources within the British Empire. He explained that the D'Arcy Company was a subsidiary of the Anglo-Persian Company, which had made such a success of the Persian oil fields after three other big companies had failed in the field. Before commercial oil was brought in, $1,000,000 was spent and then 360 miles of pipe line were constructed over mountain ranges 5,000 to 6,000 feet in elevation.

Mr. Law said the main objects for consideration in the matter were that:

1. It is an Imperial matter.
2. There is no cost to the Province.
3. The royalty of 12½ per cent is the maximum received by the United States Government from Federal oil lands in developed oil fields.
4. The royalty payable to the British Columbia Government will exceed by 300 per cent the royal collectible under the ordinary regulations now in force.
5. The Province has no money to go into the oil business, and should not take any risk in what is known to be a most hazardous undertaking.

Would Spend Millions.

6. The total expenditure which will be made in British Columbia, including the cost of pipe line from Peace River to the Coast, if oil is found in large quantities, will be $25,000,000.
7. There is no reserve on surface rights, except such as may be required for ordinary drilling operations and laying pipe lines.
8. The extension of the Pacific Great Eastern Railway to the Peace River would be assured.

9. A general development of British Columbia Peace River district would follow and contribute to the financial relief of the province by finding business for the P. G. E.

10. The total acreage sought to be controlled does not exceed one per cent of lands in the Peace River district.

11. The company is willing to be limited to the selection of ten per cent of the lands reserved.

Mr. Law explained that there were 25,000,000 acres of land east of the Rockies, which contained one of the greatest coal areas in the world. Many thousands of dollars had already been spent in exploring and prospecting for oil, but indications were not discovered until the fall of 1916. Development of oil fields in Alberta had not yet proved successful. He reviewed the history of oil developments in Western Canada and spoke of the great financial benefit which would accrue to the Province if the scheme were permitted to go ahead.

George Bell, M.P.P. for Victoria, asked Mr. Law why his company had not taken up prospecting rights under the Government regulations. Mr. Law replied that neither his company or anyone else could do as the Minister of Lands had closed the area in question from prospecting and had secured an appropriation of $50,000 to send Prof. Gwillim to investigate the district, which meant that the Government was merely doing again what had been done forty years ago by Prof. Dawson. This, he said, had been done after his proposition had been put before the Government. He considered the Government would be well advised to accept the safer and more advantageous proposition of his company.

"There is a feeling to-day that these things are given to humanity and not to a favored few. These things are in the mind of the Government, and it would be well to hear both sides of the case before dealing with the matter," remarked Mr. Bell.

"That is what we are here for," said another member of the Board.—Victoria "Times," B.C.

It is stated that Mr. J. J. Oxley, an English mining engineer is in charge of boring operations to test forty square miles of country containing oil-shales at Deer Lake, one of the upper lakes of the Humber River on the West Coast of Newfoundland. Some machinery has already been installed.

PETROLEUM IN ENGLAND.

In the Times Trade Supplement there is an article on the Derbyshire oil field, containing this statement: "So far as present indications go, the oil field in Derbyshire, although of some promise, does not appear likely to be very important compared with most of the world's oil fields."

The Hardstoft well was struck on May 28, since which time the flow of oil has been regular, though further drilling has not resulted in any appreciable increase of the production. The well is about 3,100 feet deep, and a pump is to be installed to bring the oil to the service. A gusher is not anticipated, and in calculating the yield of oil a great deal depends upon the area of the field and certain technical features. It is probable, from present indications, that the yield will be of only moderate proportions, but that the wells will be of comparatively long life. The article concludes:

"There are no indications at present that the Derbyshire wells will modify the British oil business of importing and marketing to any considerable extent. At the same time it must be remembered that it is proverbially unsafe to prophesy about petroleum, and that new facts may come to light at any time."

One fact that does not make for optimism in connection with the Derbyshire oil occurrence is that every geologist of note who has given attention to the matter has concluded that the finding of oil in quantity was improbable.

W. H. HANNAH RETIRES.

G. T. R. Chief Fuel Inspector With System Since 1880.

Mr. Wm. D. Hannah, chief fuel inspector of the Grand Trunk Railway System, with headquarters at Montreal, has retired after nearly forty years of continuous service with the company. Mr. Hannah is well known by a large circle of friends, not only in the city of Montreal, but throughout Eastern Canada and the central middle United States, where his duties have brought him in contact with a great number of people in railroad and coal circles. Mr. Hannah was born at Newton-Stewart, Wigtownshire, Scotland, on September 1st, 1844, and entered the service of the Grand Trunk in Montreal in 1880. Since that time he has been assistant agent and night yardmaster at Toronto, general inspector, station agent and fuel inspector at Montreal.

Before severing his connection with the company his fellow workers in the stores and purchasing departments presented him with a purse of gold.

F. E. LUCAS
Economy Engineer, Dominion Steel Corporation

THE NATURAL GAS AND PETROLEUM ASSOCIATION OF CANADA.

The Natural Gas and Petroleum Association of Canada held its organization meeting at the Tecumseh House, London, Ontario, on June 18, 1919. The meeting was a great success and the new Association got away to a splendid start. Sixty-eight delegates signed the roll.

Many prominent men were present, among whom were: Mr. Thos. W. Gibson, Deputy Minister of Lands, Forests and Mines for Ontario; Mr. B. C. Oliphant, President of the Natural Gas Association of America, and Dr. M. Y. Williams, of the Geological Survey of Canada.

Mr. T. P. Pinckard, President of the Windsor Gas Company, took the chair and Mr. Victor Lauriston of Chatham, Ontario, acted as Secretary. Mr. Pinckard outlined the events leading up to the calling of the meeting. At a conference of gas and oil men, held at Chatham, Ontario, last winter, the formation of a Gas and Oil Association had been discussed and a Committee was appointed to go into the matter. This Committee consisted of Mr. F. W. James, Manager of the Union Natural Gas Company of Canada, Limited; Mr. H. W. Braden, Superintendent of the Dominion Natural Gas Company; Mr. R. L. Pattinson of Chatham, and Mr. F. S. Coate, Manager of the Chatham Gas Company, Limited, and the speaker, Mr. Choate, was Chairman of the Committee. The Committee had drawn up a Constitution and a set of By-laws for the proposed Association.

The Chairman then invited a full discussion as to the desirability of forming the proposed Association. Views and comments were freely expressed by a large number of the delegates. The unanimous opinion was that a Natural Gas and Petroleum Association was greatly needed in Canada, and that such an Association should be formed without delay.

Mr. B. C. Oliphant was then called upon and delivered an instructive paper on "The Organization and Aims of the Natural Gas Association of America." Mr. Thos. W. Gibson, Deputy Minister of Lands, Forests and Mines, for Ontario, also gave an address, in the course of which he heartily commended the idea of forming such an Association.

The motion that the Natural Gas and Petroleum Association of Canada be organized was put and carried unanimously. The Chairman then read the proposed Constitution and By-laws, as prepared by the Committee on Organization, and the adoption of same was carried unanimously.

The following officers and directors were elected:—

President—Chas. E. Steele, President Sterling Gas Co., Port Colbourne, Ontario.

First Vice-President—A. M. McQueen, Vice-President Imperial Oil, Limited, Toronto, Ontario.

Second Vice-President—T. P. Pinchard, President Windsor Gas Co., Ltd., Windsor, Ontario.

Secretary-Treasurer—S. A. Morse, Secretary-Treasurer, The Union Natural Gas Co., of Canada, Ltd., Chatham, Ontario.

Directors.—R. F. Miller, President National Gas Co., Ltd., Selkirk, Ont.; A. W. Parks, Oil Producer, Oil Springs, Ontario; J. B. Williams, Jr., Secretary-Treasurer, Sarnia Gas Co., Ltd., Sarnia, Ontario; D. A. Coste, Manager Provincial Natural Gas Co., Ltd., Niagara Falls, Ontario; P. S. Coate, Manager Chatham Gas Co., Ltd., Chatham, Ontario; H. R. Davis, Vice-Pres., Dominion Natural Gas Co., Ltd., Buffalo, N.Y.

On motion it was unanimously decided that the first annual meeting of the Association to be held at Hamilton, Ontario, on Friday, the 19th day of September, 1919.

Evening Session.

At 6.30 p.m. the newly formed Association held a banquet in the Grill Room of the Tecumseh House, President-elect, Mr. C. E. Steele, presiding.

At the conclusion of the meal the President proposed a toast to the King. The toast "The United States of America" was also honoured. Dr. M. Y. Williams then delivered an address on "The Geology of Ontario as it affects Gas and Oil Production." Mr. H. R. Davis presented a paper dealing with "Some Factors Affecting the Domestic Consumption of Natural Gas." Mr. E. S. Estlin, Natural Gas Commissioner for Ontario, read a paper entitled "The Gas Enterprise of Yesterday, To-day and To-morrow." Mr. Thos. W. Gibson again addressed the Convention and predicted a very useful future for the Association in respect of the public as well as gas and oil interests. He expressed the belief that the Association would co-operate with the Department of Lands, Forests and Mines, to the end that the best interests of both distributors and consumers would be served. The meeting closed with a brief address by the President, who asked for the co-operation of all members with a view to making the new Association the success that its auspicious beginning promised for the future. After the singing of the National Anthem the meeting adjourned. Sixty-one names were entered on the roll of active membership.—C.M.I. Inst. Bulletin for August.

AMBER MICA IN CANADA.

Phlogopite, or amber mica, is soft and pliable, and is well adapted for certain electrical purposes, though its dielectric strength is not as great as that of high-grade muscovite. While it is widely known and in fair demand, the only commercial deposits so far discovered are confined to the Provinces of Ontario and Quebec, not far from the city of Ottawa.

One of the important deposits is near Kirk's Ferry on the Gatineau River, about 12 miles north of Ottawa. The deposit was first worked as a phosphate mine, and later for its mica content. It consist of a series of parallel veins in gneiss, the phlogopite being associated with pink calcite, pyroxene, and apatite. The workings are for the most part superficial, and no definite plan of development has yet been worked out. On account of a dull market, production is lagging. Present activities are confined to recovery of mica from the dump piles accumulated in early days when the deposit was worked for phosphate only. There is evidently a large reserve of mica in this locality.

What is probably the largest and best developed mica mine on the American continent is operated by the General Electric Co., near the town of Sydenham, in northwestern Ontario. The deposit consists of irregular pockets and well-defined veins in granite gneiss. The mine was first operated as an open pit worked to a depth of over 150 feet. Later, shafts were sunk and drifts projected at various levels, the lowest being 200 feet below the surface. Two types of mica are obtained, dark amber and pale amber known as "milky," the former being of superior quality.

The mica occurs in remarkably large and rich veins. One vein observed by the writer is 30 feet wide and consists almost entirely of mica in huge crystals, the largest being 4 to 6 feet across and 6 to 8 feet in length. The associated vein minerals are calcite, apatite, and pyroxene. The reserve supply is evidently very great. Present production averages about 7,000 pounds of rough-trimmed mica per week. There is a large proportion of waste which is due chiefly to minute folds and cracks.

Many other deposits of amber mica are worked, for the most part spasmodically as occasioned by the demand, or at slack periods in farming.

It is evident that the Canadian deposits are ample to supply all prospective needs, and that amber mica mining will continue as a distinctive Canadian industry.—Oliver Bowles, from June Report on Minerals Investigation of the United States Bureau of Mines.

OPENING FOR A LEARNED PHILANTHROPIST.

The Civil Service Commission of Canada advertises this month for: "An Investigator, Division of Road Materials, Mines Branch, Department of Mines, at an initial salary of $1,600 per annum. Candidates should be **graduates** in science or engineering of a **recognized university** and have had **special training** in highway engineering and the examination of road materials. They must have a **practical knowledge**, gained by **several** years of experience, in field and laboratory investigation, of problems in the use of naturally occurring road materials in their relation to factors and conditions affecting the highway construction situation in Canada. Reference to any reports the applicants have **written** should be given." The italics are ours. Obviously in the enumeration of the qualifications that the candidate for this post must possess some quite essential ones have not been mentioned. He should also surely be required to have private means, or at least a comfortable bank balance to keep him going during his term of service as a Government official, and naturally he would have to be a true patriot and lover of his country — or else terribly hard-up for a job.—C. M. I. Bulletin.

We think he would require to be all this, and more. —Ed.

CANADIAN MAGNESITE INDUSTRY.

Dead-burned magnesite is produced by the Scottish Canadian Magnesite Co. in the plant of the Canada Cement Co., at Hull, Quebec. This work began in October, 1917, one rotary kiln being used. The initial production was 35 tons of grain magnesite per day. The demand for the product has increased to such an extent that three kilns were in operation during May, 1918, the production amounting to 100 tons per day.

The magnesite as it comes from the mines in Grenville, Quebec, is mixed with 6 per cent of iron ore and the mixture is passed through a jaw crusher and ball mill and ground finely enough to pass through a 100-mesh screen. This mixture is fed to the rotary kilns, such as are ordinarily used in cement burning, and fired at a temperature approximating 2800°F. The fuel used is powdered coal which is blown into the kiln under pressure. The kilns are 60 feet long and it takes one hour for the material to travel through. The burned product is hard, dense, and granular, of a dark-brown color and about the size of fine gravel. This is the grain magnesite sold to the steel manufacturers for lining the bottoms and sides of furnaces.

The following analyses of the raw and calcined Canadian product are of interest especially when compared with the accompanying figures for the Washington material (sample 3.) The high lime content in the Canadian product is especially noteworthy.

Constituent	Sample 1*	Sample 2**		Sample 3***
Silica (SiO_2)	2.60	6.3		6.83
Alumina (Al_2O_3)	1.40	1.9	8.3	6.98
Iron (Fe_2O_3)	.34	6.4		
Lime (CaO)	9.78	16.5		3.20
Magnesia (MgO)	35.80	69.0		82.98
Carbon dioxide (CO_2)	47.10			
Water	.83			
	97.85	100.1		99.99

* Average sample of raw magnesite from Grenville township, Argenteuil County, Quebec. Analyst, R. T. Elworthy, Mines Branch.

** Dead-burned magnesite from Hull, Quebec (6 per cent of iron ore added to raw material before burning. Analyst, S. G. McAnally.

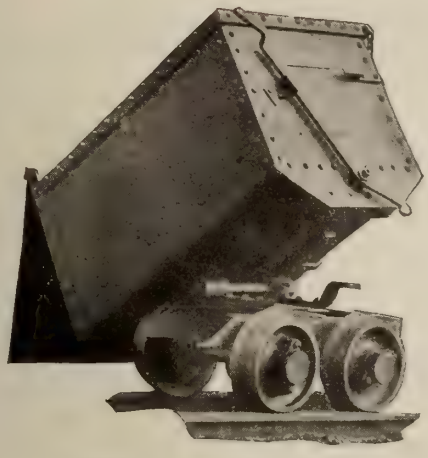
*** Average of over 200 carloads of dead-burned magnesite from Northwest Magnesite Co., Chewelah, Wash.—From June Report on Minerals Investigation of the United States Bureau of Mines.

POSITION WANTED.

Mining Engineer, 15 years experience all kinds metal mines, 12 years Superintendent, Manager and Examination. College graduate. Member C.M.I. Apply A, Canadian Mining Journal.

MINE CARS

We make the kind of Car you want, and make it just the way you want it made.



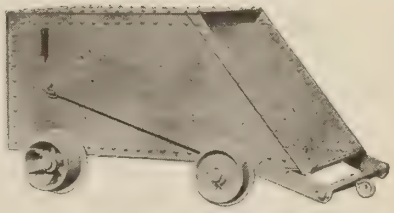
MADE IN MANY SIZES

ROTARY—Will dump at either side or either end

This is only one of the many styles of Mine Cars we offer. Let us know the type of car you prefer, and we will give you attractive prices.

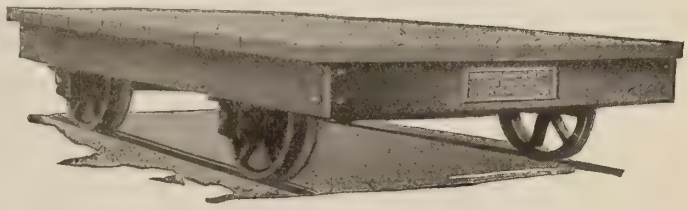
Write for your copy of our new Mining Catalogue Just off the press.

We have been designing and building cars for a quarter of a century. Our designers know their business, and are at your service free of charge.



STEEL SKIPS

For use on Mine Tipple. Made any size to suit your work, and if desired, with double bottom, and rivets countersunk and flush on the inside, to facilitate easy dumping.



HEAVY BUILT PUSH CAR

A good general purpose car for any kind of heavy work. Heavy steel frame work decked with 2½ in. or 3 in. planking. Self-oiling babbitted boxes. Made for any gauge of track, and any required weight to suit the load.

If you use Wood Cars we can supply you with the wheels, Axles, Boxes, etc., so you may build your own cars. You will save money by so doing.

MARSH ENGINEERING WORKS, LIMITED, Established 1846 **BELLEVILLE, Ontario, Canada**

Sales Agents: MUSSENS LIMITED, Montreal, Toronto, Winnipeg, and Vancouver

FOR SALE

2 Norwalk straight line three stage Compressors for charging air locomotives, having compound steam cylinders and two flywheels.

Air pressure 800 lbs. Steam pressure 110 lbs.

Size of steam cylinders—High pressure, 20 ins. diameter. Low pressure, 38 ins. diameter. Stroke, 36 ins. diameter.

Size of air cylinders—23 ins., 16 ins., and 8 ins. in diameter.

ALSO THE FOLLOWING LOCOMOTIVES:—

Maker	Size	Description	Dia., Driver	No. Wheels	Wheel Base	Weight	Length Overall
2 Porter	7″ x 12″	Simple	23″	4	4′0″	14000	13′4″
4 Porter	10½″ x 14″	”	26″	4	5′3″	30000	19′4″
2 Porter	7″ x 14″	”	24″	4	5′3″	20000	18′0″
1 Baldwin	11″ x 14″	”	28″	6	6′6″	40000	22′8″
1 Baldwin	11″ x 14″	”	28″	6	6′5″	34000	19′8″
1 Baldwin	9″ x 14″	”	28″	4	5′6″	25000	17′0″

These locomotives are 3 ft. gauge and have a clearance height from top of rail of 4 ft. to 5 ft. 2 in.

This machinery is all in working order and is open to inspection at Glace Bay.

DOMINION COAL COMPANY Limited, Glace Bay, N.S.

International Mining Machinery Exposition Announced

Announcement is made by the Merchants and Manufacturers' Exchange of New York that one of the big permanent expositions to be a part of its great world trade mart in Grand Central Palace will be the International Exposition of Mining Industries. Since the announcement made some weeks ago that the Merchants and Manufacturers' Exchange was to take over Grand Central Palace for the purpose of turning it into a mammoth trade clearing house, considerable comment has been made in many lines of industry, especially in the mining world.

The new enterprise enjoys phenomenal backing. The Nemours Trading Corporation, of which Alfred I. du Pont is president, owns and controls the Merchants and Manufacturers' Exchange of New York. It has branches in all of the leading cities of the world, consisting of 19 branch offices and 3,000 foreign selling agencies.

The Exposition of mining industries will fill a long-felt want in its own particular field. The development of both foreign and domestic trade to which the venture looks forward unquestionably will be remarkable during the next few years, and in this development the Merchants and Manufacturers' Exchange in general, and the Mining Exposition in particular, will be big factors.

Already the fame of the enterprise is spreading throughout the world and newspapers and trade papers in many foreign countries have commented upon it most favorably. It is practically assured that Grand Central Palace is destined to become a mecca for buyers both domestic and foreign.

Through representatives of the Nemours Trading Corporation inquiries from many parts of the world where machinery and other commodities are desired will be referred to the Merchants and Manufacturers Exchange, and these pertaining to mining will be referred to the Mining Exchange and exhibitors of the specified lines of goods so notified.

The Exposition of Mining Industries will include all that is latest and best in machinery used in the development and exploitation of metal mines, non-metal mines, and oil wells. Likewise machinery used in the subsequent extraction, reduction or refining of the raw products by concentration, leaching, cyanidation, flotation, smelting, distillation, coking, etc.

One great talking point of the Merchants and Manufacturers' Exchange is that buyers going to the Palace who are interested especially in one line of goods in one exchange, will also take advantage of the opportunity to visit the other expositions and exchanges in the building at the same time, with the result that they will find other things of interest in addition to what they came especially to see.

Howard R. Ward will manage the International Exposition of Mining Industries. He is a mining engineer who has practised in the west for the last fifteen years. Prior to entering war work he was for three years consulting mining engineer with the American International Corporation and in addition to his mining work was associated with the organization of its machinery export companies both home and abroad. Inquiries should be addressed to Suite 421, 405 Lexington Avenue, New York.

British Columbia

DOLLY VARDEN LAND GRANTS TO BE REGISTERED.

On the application made by Mr. E. C. Mayers, on behalf of the Taylor Engineering Company, Mr. Justice Murphy has granted an order compelling the registration of certain lands in connection with the Dolly Varden Mines.

In spite of the fact that, by judgment of court and by statute this property has passed into the hands of the Taylor Engineering Company, the registrar refused registration.

It was necessary to exercise care about such a matter, said Mr. A. G. Smith, registrar of land titles. He showed there were technical conflicts about mineral and surface claims and that Crown grants and charges had not been shown according to law.

Registration was ordered to be made by Mr. Justice Murphy, who held that a statutory right was as good as a crown grant.

PERSONALS—Northern Ontario.

R. J. Ennis, general manager of the McIntyre-Porcupine mine, has returned to Porcupine from a brief business trip to southern points.

T. R. Finucane, director of the McKinley-Darragh mine paid a visit to the property.

Robert W. Norrington, together with Mr. Smith, of Detroit, both of whom are interested in the Allied Gold Mines, have returned from a trip to the Matachewan gold area where they made an examination of property held in that district.

The many friends of Mr. Alstair MacGregor, who has travelled in Northern Ontario almost since it opened up in steel and kindred lines, will very much regret to learn that he died at his residence in Toronto after a short illness on Wednesday, July 30th, 1919.

Mr. W. C. Weir, the Secretary of the Temiskaming Mine Managers' Association, died suddenly in a Toronto Hotel on July 29th.

DEEPEST SHAFT IN PORCUPINE.

McIntyre Now Down to a Depth of 1,300 Feet.

McIntyre Porcupine has now the distinction of having the deepest workings in the Porcupine camp. The main shaft has reached a depth of 1,300 feet and is being continued to 1,350 feet where a main tramming level will be established.

Hollinger workings have reached a depth of 1,250 feet, and the deepest work at the Dome is at 1,100 feet. Diamond drill holes have been put down by all three mines to much greater depth, which have proven the existence of similar conditions as met with on upper levels of the mines. That Porcupine is becoming a deep mining camp can be seen by following the developments on its leading properties.—The "Northern Miner."

EDITORIAL

THE COBALT STRIKE—STATEMENT OF THE MINISTER OF LABOUR.

The "Journal" has received the following letter from the Minister of Labour:

Ottawa, Ontario,
Aug. 6th, 1919.

My Dear Sir:—

Some articles appearing in your Journal of July 30th, relating to the Cobalt Miners' strike, your editorial notes and a reproduction of an editorial which appeared in the Montreal "Gazette" have been drawn to my attention.

Do you not think that it would have been but fair to have printed along side the quoted editorial from the Montreal "Gazette" the official statement given out by this Department as to its connection with the Cobalt difficulty and the attempts made to bring about an adjustment of the dispute by conciliatory methods?

The reproduction of the editorial from the Montreal "Gazette" would lead your readers to an entirely incorrect impression as to the attitude of the Department and the Minister, and is quite misleading.

If consistent would be glad to have this erroneous impression corrected in your next issue, by making reference to the official statement given out by the Department which properly sets forth the facts.

Yours very truly,
G. W. ROBERTSON,
Minister of Labour.

Editor, Canadian Mining Journal.

The statement of the Minister—to which we are very glad to give publicity—is as follows:

Interviewed as to cause of Cobalt strike and steps taken to avert it the Minister of Labour stated that, in his opinion, it was due to the expressed determination of the Temiskaming Mine Managers' Association not to deal with or recognize the Miners's Union. The employers base their stand on past unsatisfactory experiences in dealing with the Western Federation of Miners which, in the Minister's opinion, was, at that time, quite justified. During recent years the policy of the Western Federation has materially altered; employers who now recognize and deal with the Federation find the results quite satisfactory. It is, therefore, rather unfortunate that the Temiskaming Mine Managers' Association should judge the Federation now by its policy and leadership of ten years ago, when Mr. Haywood was its leading spirit.

On June 9th last the Miners' representatives brought the existing dispute to the attention of the Department of Labour. An official of the Department visited Cobalt on June 11th, and had conferences with both the Mine Managers' Association and the Miners' Committee, but could not effect an agreement. He, however, obtained an undertaking from the Committee not to call a strike until the Minister returned from the West.

On July 1st the Minister addressed a joint communication to Mr. W. C. Weir, Secretary of the Mine Managers' Association, and Mr. Jos. Gorman, President of the Miners' Union, recommending that inasmuch as both employers and workmen were organized that one or more representative of the men from each of the 16 mines affected and the managers should have a conference, for the purpose of reaching an agreement, if possible. Should they fail it was then proposed that they should agree to refer the matters in dispute to a Board of Conciliation. A representative of the miners came to Ottawa and reported that the men agreed to the suggestions made, but that the employers declined, which statement was confirmed in a letter from the employers to the Minister.

The situation was then explained to the Prime Minister, and a decision reached to invite a delegation of the employers to come to Ottawa for a conference, which invitation was acknowledged and declined in a wire from the President of the Managers' Association on July 15th. The representatives of the men were then informed that there was only one other alternative left within reach of the Government, which would be to appoint a Royal Commission to investigate the trouble. Subsequently, I believe, the employees offered to accept a commission if the employers would agree to accept its decision. Upon the employers declining to agree to this suggestion the strike was called.

The Minister of Labour emphatically denies Press reports that he encouraged the strike, but, on the other hand, did everything consistent and possible to prevent it.

The "Journal" desires to explain that there was no intentional discourtesy or unfairness in omitting to publish along with the "Gazette" editorial the statement of the Minister, which, when our issue of the 30th ult. went to press, had not come to our notice.

With regard to the Minister's proposal that one or more representatives from each of the sixteen mines affected should confer with representatives of the Managers' Association, there is no doubt that this suggestion was an excellent one, and outlined the manner in which the dispute must eventually be adjusted, but unfortunately the union leaders blocked the proposal by stipulating that at this conference the Executive of the Union should be present. As the whole dispute concerns the question of "recognition" and nothing else, it is clear that the interpolation of this stipulation vitiated the essential fairness of the original proposal and distorted its intent.

In the "Correspondence" we publish a letter from "Another Engineer" who well remarks that "the character of the union has not been the character of its members but of its active leaders," and the objection of the Managers' Association to recognizing the Union, based on the record of leadership of the Western Federation of Miners, is admitted by the Minister to have been justified in the past.

"During recent years," states Senator Robertson, "the policy of the Western Federation has materially altered," and here lies the stumbling block to a settlement. The Mine Managers' Association believes it has no guarantee of the probability of satisfactory dealings with the present strike-leaders.

If the point of recognition of the Western Federation of Mines (or its local affiliation) is eliminated, all the essentials for a settlement exist. Good wages, short working-hours, collective bargaining in its widest and best sense, profit-sharing, and representation of workmen by committees, are all conceded and have been practised for a long time at Cobalt.

THE USE OF THE BAROMETER AT MINES.

Our contemporary "Coal Age" publishes a series of letters debating the utility of the barometer as an indicator of the variations in the composition and distribution of mine air occasioned by alterations in the atmospheric pressure.

A correspondent from Ladysmith, B.C., points out out the greater usefulness of the compensated, aneroid recording-barometer, and the small value of the mercurial barometer in giving warning of important changes of atmospheric pressure.

There can be little doubt that the changes in pressure shown by the mercurial barometer follow the effects of such changes of pressure on the mine gases at such a long interval as to make the mercurial instrument quite useless for purposes of warning.

It is doubtful also whether the recording-aneroid is of much utility, except possibly in mines where there are large unventilated goaves communicating with working places, but the recording barometer has the advantage of showing the tendency of the barometric pressure. Long observation of the barometric charts in one locality, combined with observations of the wind direction, temperature, season, and some knowledge of of the local meteorological peculiarities, will enable the observer to deduce certain probabilities from the trend of the barometric curve which, if linked up with perusal of the reports of the Government Weather Bureau, will prove of advantage to mine managers who are aware of underground conditions in collieries under their control likely to be affected by sudden barometric changes, or by unusually high or low readings.

Nevertheless, although the reading and recording of the barometer has been compulsory at most collieries for a good many years past, no tangible correspondence or connection between colliery explosions and the state of the barometer has been worked out.

At one time so-called "colliery warnings" were issued in Great Britain, giving publicity to unusual conditions of the barometer, and for a number of years these warnings were a source of mirth to colliery engineers, because the conditions they announced had in all instances come to pass before the "warning" was printed.

The science of weather prediction has made great strides in recent years. Nothing was more striking in the log of the "R-34" dirigible's voyage across the North Atlantic than the accurate weather observations and predictions. By the use of wireless messages, and the more careful weather observations which will doubtless be arranged and recorded by all civilized governments in the future, it may be possible for colliery managers to be accurately forewarned of coming atmospheric pressure variations.

At the best, however, the usefulness of the barometer to the colliery manager is small, and the best safeguard is, as pointed out by the British Columbia correspondent, to see that the mining law requiring the provision of adequate ventilation is properly carried out.

Another correspondent states that the barometer in the United States will average a range of from ½ to ¾ inch, and that the maximum range may be assumed as not exceed two inches, and this only rarely. Fluctuations of a greater range than this have we believe occurred on several occasions in Nova Scotia, particularly in the vicinity of the Bay of Fundy, but so far as ascertained no extraordinary conditions manifested themselves underground on these occasions of maximum and minimum readings.

The views of the readers of the Journal on this matter, and any particulars of unusual barometric variations with associated phenomena in connection with mine air which may have been observed, would be of general interest and value.

GROWTH, NOT "RE-CONSTRUCTION."

There is a tendency in trade periodicals in the United States to refer to conditions of trade and prices as they existed after the American Civil War, and from these conditions to draw inferences as to the trend of events after the Five Years' War just ended. Is it not a rather useless proceeding?

The territory, trade, transportation, population and industry of the United States when the Civil War ended were in no sense comparable or analagous to present day conditions.

During the Civil War the resources of America were wasted by civil strife, the destruction wrought affected only the citizens of the United States.

Preceding the entry of the United States in 1917 into the fight that commenced in 1914, the need of the Allies was the industrial opportunity of the United States, and probably the material help that was afforded by the munition plants of the United States to the Allies before April, 1917, was as effective in defeating the Germans as was the military and naval aid that was afforded after the United States came fairly into the lists. Further, thanks to her unimpaired and generous man-power, the United States was able throughout the progress of the war not only to afford ever increasing military assistance, but was able to keep her manufacing establishments working at full pressure on supplies for the Allies.

Since the close of hostilities, as well as preceding this, the food-needs of Europe were met by exports from the United States in very large part, and this work of both necessity and mercy, proved also very profitable to United States producers.

Moreover, the future will probably make demands on American exports fully as heavy as the country can supply, which means a continuance of profitable merchandising in Europe with the profit accruing to the United States.

Why, therefore, should the United States fear the problems of re-construction? They have none. The

problems of growth are more likely to trouble our neighbours.

The analogies of the aftermath of the Civil War would apply with greater accuracy to the future of Germany, or France. In these countries reconstruction is an actual and dire problem that will tax the courage and patriotism of all the citizens of these countries to the utmost.

All that has been remarked herein regarding the outlook of the United States applies to Canada. While the population of Canada offered, in proportion to their numbers, a much greater sacrifice to maintain the rights of man than did the United States, yet economically speaking Canada is a nation just as virile, and with more virgin potentialities than even our extremely numerous and wealthy neighbours.

There are scars in Canadian hearts that only time can heal, and memories and regrets that will out-last this generation, but, from the mere viewpoint of commercial prosperity and industrial permanence, Canada has no more a "re-construction" problem than has the United States.

Not a foot of Canadian soil—except the Ridge at Vimy—has suffered violence at the hands of our foes, and we have prospered materially. Perhaps the distribution of the material gains of war has been unfair, but industrially, commercially, financially, and politically, Canada never was so eminent as she stands to-day. Morally also, and in the springs of nationhood, has Canada been tested, and we are citizens of no mean country.

Let us, therefore, also cease lamenting the problems of "re-construction," and get down to work. It is growing pains this country has, nothing worse, and many of our troubles are nothing but a state of mind.

EUROPE'S DIMINISHED COAL PRODUCTION.

By the actual physical destruction of coal mines, by death in war and from war-diseases and war-caused famine; by the removal of miners to other occupation through conscription and personal preference, by deliberate reduction of production through shorter working hours, and by the unbalanced and unefficient character of the colliery working organizations—which is another aftermath of war—the coal-mining industry of Great Britain and Europe has become reduced to terrible straits.

While the suicidal tendency of coal-mining events have been long foreseen by those engaged in the commercial direction of the industry, it has apparently required the voice of a mining engineer from the United States to crystallise the situation, and it is to be hoped that no international jealousies will be allowed to lessen the weight of Mr. Hoover's utterances, which are made out of his technical knowledge of mining, aided by his unique knowledge of the internal conditions of Europe and his detached and disinterested viewpoint as a citizen of the United States.

Mr. Hoover points out that the coal production of Europe is reduced thirty-five per cent from the normal, that the problem is domestic to Europe and cannot be allieviated by coal shipments from this side the water because of the shipping shortage. Mr. Hoover is specific when he characterises the coal shortage as "the greatest menace to the stability of life in Europe," but we are certain that Mr. Hoover did not, as reported, state "the fate of European civilization now rests in the hands of the coal-mine owners of Europe," because the colliery owners have little or nothing to do with their mines nowadays.

The territorial adjustments have been largely influenced by considerations of coal, and the relatively smaller extent of coal-bearing territory now held by Germany, together with the larger areas now held by France and Poland will in due time exert weighty influences on the industrial progress and material wealth of these nations, but today the problem that faces all Europe alike is that of destroyed mines, dissipated working organizations, wrecked transportation systems, and highly organized groups of miners who know exactly what they want and precisely how to get it, but are careless of the effect upon the rest of mankind.

A further consideration is that a reduction in European coal production was approaching, whether there had been war or not. What is true of the British mines is true of all European mines, namely, that the best picking is gone, and what remains has to be won by increased effort, at increased depths, from thinner and inferior seams, and under conditions of cost which have to bear a large proportion of expenditures that should have been amortized and charged into the selling price of coal years ago. In one sense it may be said that coal is not so much dear to-day, as it has been sold at deceivingly cheap figures in former years.

United States papers, and many English papers also, make a great deal of the greater percentage of machine-mined coal in the United States, and intimate that the small production per man in British mines, and the greater cost of mining in Britain is largely due to the unprogressive attitude of the British coal-owner who will not use mining machines to the fullest possible extent.

If a comparison were to be made between the physical characteristics of the seams from which coal is to-day won in Britain, and the seams from which coal is now being taken in the United States, the comparison would remove a good deal of misunderstanding. Coal is being mined in Britain, and in Continental Europe to-day, under conditions of great depth, inclination of seams, faulting, inferior quality of coal, distance from the pit-mouth, drainage, ventilation, gas emission, thinness of seams, and drastic government regulations, of which United States miners have no conception.

Britain and Europe also is in the second stage of coal-mining to-day, a stage that has not been entered upon in the United States, unless it be in the anthracite mines.

To coal-mines operated under such conditions of failing extent, five years of time, and that war-time, makes a great difference. It is extremely unlikely that the European coal-mines taken as a whole, can ever again reach pre-war figures of production, and it will be a long long time before the collieries reach the maximum production of which they are capable, which, it may be re-stated will not equal pre-war figures. This condition might as well be faced by those who have the consideration of European coal matters. While lessened hours of labour will doubtless play its part in reducing the coal production of the future, the diminishing productivity of European coal-mines will be a factor less amenable to amelioration than labor efficiency.

No amount of mechanical coal-cutters will help this condition very much, or for any length of time, and it may be further remarked, in fairness to British coal miners and those who direct their work, that coal is being cut in Britain by mechanical cutters in seams so thin and deep that no United States mining engineer would consider the feat possible, unless possibly he also, like the British miner, was driven to mining under such difficult conditions by sheer lack of more easily mined coal. An advertisement in a well-known United States trade periodical refers to a pump installation in the "deepest bituminous coal-mine in the United States" in a shaft 1100 feet deep. The correctness of this figure is not ascertained, but in Britain 1100 feet would be considered a shallow mine, and one of the pressing problems of British coal-mines today is how to mine at great depths under conditions of high temperature.

"Only a greatly increased coal production, and improved organization for its distribution can save Europe from disaster next year," says Mr. Hoover, who further urged that some sort of fuel control be established to bring this about, but declined to accept the post of director of the proposed Commission, stating he believed the problem to be strictly European. In makink his statement, Mr. Hoover shows that he realises that European problems must be solved by Europeans, but the thanks of all are due to him for courageously telling some truths about the menacing aspect of the problem of coal supply.

The greatness of the coal necessity of Europe is shown by the statistics collected under Mr. Hoover's direction, which indicate a probable coal output in Europe next year of 443,000,000 tons, against requirements of 614,000,000 tons.

As an exporter of coal, Europe is completely and finally out of the running, which is not the least significant event in these upsetting and world-shaking days.

Admiral Tirpitz says: "The Germans never understood the sea. In the nation's fateful hour the fleet was not used. I can only write the epitaph."

But the British did understand the sea. It is their father and mother too. And the British Navy wrote the German epitaph.

THE IMPERIAL MINERAL RESOURCES BUREAU

The Imperial Mineral Resources Bureau, organized for the collection of information with reference to the mineral resources of all parts of the British Empire, has been incorporated. The Charter granted on June 12th, provides that there shall be representatives of the United Kingdom, Canada, Australia, New Zealand, South Africa, Newfoundland and India appointed by the several governments. The Secretary of State for the Colonies will represent all other parts of the Empire. There shall also be six other persons who "may from time to time be respectively appointed by the Lord President of Our Council for the time being, and after due consultation by him with all important interests concerned shall be the President and Governors respectively of a body corporate by the name of "The Imperial Mineral Resources Bureau."

The purposes of the Bureau are: (1) to collect, coordinate, and desseminate information as to the resources, production, treatment, consumption and requirements of every mineral and metal; (2) to ascertain the scope of existing agencies, with a view ultimately to avoid any unnecessary overlapping that may prevail; (3) to devise means whereby existing agencies can, if necessary, be assisted and improved in the accomplishment of their respective tasks; (4) to supplement these agencies, if necessary, in order to obtain any information not now collected which may be required for the purposes of the Bureau, (5) to advise on the development of the mineral resources of the Empire or of particular parts thereof, in order that such resources ma be made available for the purposes of Imperial Defence or Industry or Commerce.

Earl Curzon is the first President of the Bureau. The first Governors are: Sir Richard A. S. Redmayne, K.C.B., Chairman of the Bureau and Representative of the United Kingdom, appointed by the Lord President of the Council; Willet G. Miller, L.L.D., appointed by the Government of Canada; Thomas H. Hamer, appointed by the Government of Australia; William S. Robinson, appointed by the Government of New Zealand; Hon. William P. Schreiner, C.M.G.K.C., appointed by the Government of South Africa; Hon. Edward P. Lord Morris, K.C.M.G., appointed by the Government of Newfoundland; Richard D. Oldham, F.R.S., appointed by the Government of India; John William Evans, D.C., appointed by the Secretary of State for the Colonies and the following persons appointed by the President of Council; Westgarth F. Brown, Frederick H. Hatch, Sir Lionel Phillips, Edgar Taylor, Wallace Thorneycroft and Thomas Turner.

The success of the Imperial Mineral Resources Bureau will naturally depend upon the men who are its first Governors. In the list of names above are many well known among mining men in Canada. There can be little doubt that if these men meet frequently and do their best to perfect such an organization as is planned they will do great service to the industry and to the Empire.

In Dr. Miller Canada has an able representative on the Board of Governors. He will do his share towards making the Bureau really useful to the Empire and he will bring to his confreres reliable information concerning Canada's rich mineral resources.

The Revival of Local Ore Treatment: The "Journal" is pleased to be able to publish the text of the address on the revival of local ore treatment given by Dean Francis A. Thomson of the University of Idaho, at the International Mining Convention, held last June in Nelson, B.C.

A condensation of this address was contained in the report of the Nelson Convention contributed by our B.C. correspondent to the "Journal" of July 9th, but readers may desire to read the argument for the revival of the small smelter in full.

CORRESPONDENCE.

Sudbury, Ont., August 8, 1919.

The Editor of the Canadian Mining Journal,—

Dear Sir,—All who are interested in the Canadian mining industry must deeply regret the strike at Cobalt. But no one who is interested in genuine industrial peace, which can only exist on a basis of mutual good faith, can avoid sympathizing with the Cobalt mine operators.

The writer was in Cobalt twelve years ago, when the first strike was started and a "gentleman of the name of McGuire" was president of the local union. There could be no question as to the evils of policy and leadership where Mr. McGuire was concerned.

Then, as now, a large number of the steady men—the majority, I believe,—were opposed to the actions of the union officials. Yet they seemed to be unwilling to oust them from positions of trust they freely claimed the officials were abusing. Such unwillingness of the sane majority to control, and if necessary to repudiate, unwise leaders is an unfortunate weakness in many unions, including the Western Federation of Miners under whatever name it has appeared. The character of the union has not been the character of its membership, but of its active leaders. No sensible man can blame the Cobalt mine operators for refusing to deal with parasitical leaders, or for preferring to deal directly with the essentially sensible body of their own men.

The Montreal Gazette, as quoted by you sees more in the Cobalt strike than there really is: The spirit and good sense of the majority of the men are sound, but the men, individually and collectively, seem to be stricken by a strange helplessness when it is necessary to repudiate reckless, self-seeking leaders. This strike, engineered by the union officials, is not a manifestation of a political movement, but it is a selfish and heartless exploiting by the union officials of the instinctive loyalty of men toward each other.

Yours truly,

ANOTHER ENGINEER.

Brussels, July 10th, 1919.

The Editor of The Canadian Mining Journal,—

Dear Sir,—We wish to present to you a matter that is of more interest to the mining machinery companies of Canada who are looking for business in Europe than it is to ourselves.

To explain: We are receiving many inquiries and corespondence from Canadian mining machinery concerns, which mostly are inadequately stamped. We do not mind in the least paying the extra postage, but we think it possible that European concerns here who may receive similar insufficiently stamped correspondence, might think that Canadian concerns should acquaint themselves with this matter. We cannot find time or trouble to write to each individual company that addresses us as pracically all these companies are guilty of this lack of knowledge or attention, and we thought that in the interest of mining industry you could perhaps find in your magazine space for a short message stating that you had received notification from Belgium that a three-cent stamp is insufficient on letters and a five-cent stamp is necessary. I state it in this way as one firm replied to us that they were told at the post-office this was sufficient; but our regulations here say a five-cent stamp and of course we are governed by the latter.

We extend you our thanks for the attention you will give to this matter and remain,

Yours very truly,

JUALIN ALASKA MINES CO.,

E. G. ASHBY,

Chief Accountant.

Note:—This letter was submitted to the Postmaster of Montreal who replies: "The rate on letters to Belgium is five cents for the first ounce, or fraction thereof, and three cents for each additional ounce."

GRANBY WORKMEN GET HIGHER PAY.

Anyox, August 5.—With the price of copper soaring and maintaining a level of twenty-three cents per lb. flat from smelter to refinery for the two weeks ended August 1, the Granby Consolidated Mining, Smelting & Power Company has posted another advance in wages to men in its employ. A twenty-five-cent raise per day to all men, which was posted on July 16, has now been capped with a further increase of fifty cents per day, effective from August 1. Notice to this effect is now posted at the Granby works here and at adjoining properties owned by the company.

The latest increase places this camp in the list of those paying the highest wages of any camps on the North American continent. All the Granby workings are under the eight-hour plan.

Since the signing of the armistice ending the great war increased prices in copper have resulted to date in an increase of wages over the basic scale of $4.25 per day, miners now receiving $5.75 per day straight time of eight hours. Muckers get $5.25 per day and common labor is paid for at the rate of 6½ cents per hour, or $5 per day.

A R. Roberts, lately of the firm of Burns & Roberts, Toronto, has severed his connection with the firm and opened offices under his own name at 201 Bank of Hamilton Building, Toronto. He will handle contractor's power plant and railway equipment.

The Revival of Local Ore Treatment

By FRANCIS A. THOMSON,

Dean, School of Mines, University of Idaho.

(Notes from an Address delivered at the International Mining Convention at Nelson, B.C., June 20th, 1919.)

One of the outstanding features of metallurgical economics during the past 30 years have been the consolidation of treatment plants at strategic centres. This was of course the logical and inevitable result of what our socialistic friends call "economic determinism." It would seem, however, that for causes which I shall attempt presently to show, this movement has about reached its maximum and that the pendulum is due to swing in the opposite direction.

Those of you who are familiar with metallurgical history will recall that prior to 1890 there were only three ore-treatment processes in general use, viz.: Amalgamation, Smelting, and the numerous more or less unsuccessful leaching schemes. During this period little smelters dotted the landscape wherever there were mines, unless the ore were readily amendable to amalgamation; and this was usually true only while the mine was working in the oxidized zone.

Throughout the Western States were hundreds of little smelters operating often inefficiently and always expensively because of lack of variety in their ore supply. This situation continued until the period of consolidation, which might be dated from 1890 to approximately 1920.

In British Columbia out of nine or ten plants formerly in active operation, Pilot Bay, Nelson, Sullivan, Revelstoke, Vancouver, Trail, Van Anda, Crofton, Ladysmith and Northport (a British Columbia smelter built in Washington, and no longer to be counted as a British Columbia asset), Trail alone survives. In the Western States, Tacoma, the Selby Plant at San Francisco, two or three plants at Salt Lake, one at Denver, one at Leadville, and one at East Helena, at Northport and at Kellogg represent the hundred or more smelters, large and small, of which they are the lineal descendants and successors in interest.

Monopoly, yes, inevitably under the circumstances; stifling of competition of course, due to the immutable laws of chemical combination.

The smelting business is as natural a monopoly as the street car business, or the telephone business. That does not mean it should be free from scrutiny, quite the contrary indeed.

Let me illustrate briefly and simply by a hypothetical case. Suppose we have three mines, A. B. and C., each producing 200 tons of smelting ore, and each manager smelting this at his own mine. A. has a silicious ore; B. an iron ore; C. a limey ore. Let us assume further in order to make the thing quite concrete, that each ton of ore requires a ton of flux and that the total smelting cost per ton of furnace burden is, let us say, $4. Then the cost to A. to B. and to C. will be $8 per ton of ore smelted; that is $4 per ton of flux, which yields no valuable product. Now if the smelting of these three ores can be carried out at one centrally located plant with a capacity of 600 tons, the cost under the conditions assumed, will probably be less than $4 per ton, plus freight, so that the central plant will be able to charge $5 or $6 per ton, make a profit of $1 or $2 and cut the cost for A., B. and C. of a like amount, thereby making a profit of $500 to $1,200 per day, and a saving to the three mines concerned of a like amount.

This illustration is, of course, schematic, and not at all exact, it will serve nevertheless to demonstrate the logic and inevitability of smelter consolidation. Yet I believe we have gone about as far as we are going in that particular direction — not that I think Trail is going to be put out of business and that we are going back to the days of the little inefficient smelter, but that metallurgical developments of the last 30 years, beginning with the application of the cyanide process by McArthur and Forrest in South Africa, here made it evident that smelting has no longer the supremacy in ore treatment which it formerly enjoyed. This situation is due to the developments in two fields, flotation and hydrometallurgy.

As long as recoveries by water concentration were hovering around 70 per cent, direct smelting was often, indeed I would say, in most cases, preferable, because of the higher recoveries possible by smelting. With the coming of flotation, making possible recoveries of 90 per cent or better, smelting is no longer necessarily preferable as a primary treatment process—and hence the field of raw ore smelting is being continually narrowed and more and more the smelters are being embarrassed by receipts of larger and still larger tonnages of flotation concentrate.

Meanwhile great strides have been made in the field of hydrometallurgy. This is perhaps best exemplified in the case of zinc, the hydrometallurgy of which has progressed by leaps and bounds in the last five years. The leaders in this work have been the metallurgists at Trail and at Anaconda, and while there has and probably will continue to be a good deal of dispute as to who was the inventor or discoverer of this process, it must be said of the men at Anaconda and Trail, as was said of McArthur and Forrest in the historic cyanide controversy, that "They converted what had heretofore been a pretty chemical scheme into a sound commercial success." Indeed so successful has electrolytic zinc become that in spite of predictions to the contrary, it will be able to stay in the market in competition with retort zinc even at the present low price levels.

Leaching of copper ores, both oxidized and semi-oxidized, is being carried out on a large tonnage basis in the south-western States and in South America. So far as sulphide copper ore is concerned, not much progress has been made, but there is no inherent reason why a method similar to that employed for zinc-roasting, followed by sulphate leaching, should not be successfully developed.

The hydrometallurgy of lead lags behind that of her sister metals, perhaps because of the relative insolubility of lead compounds. There is promise, however, in the new process for the volatilization of lead and silver in the form of chlorides, followed by recov-

ery in Cottrell Treaters, phenomenal extractions having been made with this scheme on a large laboratory scale.

Gold and silver we can always recover, if the cost is justified, by cyaniding, sometimes as in the case of gravity or flotation concentrate from gold or silver ores, only after roasting however.

Now in most cases these hydrometallurgical methods neither require nor justify centralized plants, provided any one mine or district can supply sufficient ore to ensure the minimum tonnage necessary for economical operation. The great advantage which lies in mixing ores for smelting does not apply to hydrometallurgy at all. In fact, each ore is likely to require slightly different treatment and the plant treating the ore from one mine is likely to have the simpler problem. Coke supply—always a bug bear to the lead and copper smelter need no longer be considered, cheap fuel can be used for roasting if indeed the ore does not practically furnish sufficient heat for its own roasting. In zinc, and in copper to a less extent, probably also in lead as its hydrometallurgy is developed, there will be need for abundant and cheap electric power, this, however, can be transmitted to any point readily if it can not be developed near at hand as is usually the case except in the desert regions.

There is a further general advantage possessed by hydrometallurgical methods, namely, that the residue or tailing is readily amenable to further treatment, a condition not true of slag, the pyrometallurgical residue.

For these reasons therefore I believe we face an era of decentralization in metallurgy and that in view of what has been said concerning flotation and hydrometallurgical development, I am convinced that the next 25 or 30 years will witness a renaissance of home treatment. This will, of course, by no means make the large centralized plants, such as Trail, superfluous, far from it, for they will have more to do than ever although the nature of the material they are called upon to treat may be somewhat different.

The net result will of course be the treatment of more ore, of lower grade ore, and the production of more gold, silver, lead, copper and zinc on both sides of the 49th parallel, for these problems are common to Canada and the United States, and they are being solved co-operatively, and with the freest interchange of information and ideas.

H. M. COMMISSIONER REPORT ON ONTARIO'S MINERAL INDUSTRY.

In the report of the British Trade Commissioners on the Trade of Canada and Newfoundland for the year 1918, the mining industry of Ontario receives attention. Mr. F. W. Field, who was a short time ago appointed His Majesty's Trade Commissioner at Toronto points out that the production of minerals is large and varied, and that the prospects for increasingly large outputs are good, the greater part of the undeveloped areas of the province being of pre-Cambrian formations, which are the chief productive rocks in this part of Northern America.

Mr. Field is an Englishman who has resided for several years in Ontario. He is well informed on financial and industrial conditions, and can be depended upon to furnish reliable information concerning the trade of the province. Much of the information in this report will prove of interest to all Canadian as well as to the British manufacturers who are specially served by the activities of the Trade Commissioners.

SAND AND GRAVEL IN ONTARIO.

Report by A. LEDOUX.

Part Two of the Ontario Bureau of Mines Report for 1918 consists of a monograph on the sands and gravels of Ontario by A. Ledoux.

The Report, it is explained, should be considered only as a preliminary one, deposits in over forty counties having been visited during four months of field work, thus allowing only a very short time for detailed examination of any deposit. Under these circumstances, the extended scope of the monograph, and the very full and detailed information it contains, is evidence that no time was wasted by its author.

The Report begins with a review of the characteristic properties of sand and gravel, and the methods of testing applied. These properties have been divided into morphological, physical and chemical. The origin and occurrence of the sands and gravels are explained, such considerations being of practical interest, as there is a close relation between the geological origin and the qualities of sands and gravels. In numerous cases continuous lines of deposits, marking ancient lake shores, may be followed in southern Ontario. An interesting map is included in the Report, showing the trace of the ancient shore lines and channels of Lake Iroquois and Lake Algonquin, which occur within the Province of Ontario.

"Most of the sand and gravel deposits in southern and eastern Ontario are very closely connected with the geological history of the Great Lakes. Just as the present shore lines do not show continuous deposits of sand and gravel, the old shore lines are marked by isolated zones or areas more or less parallel to the present shore lines."

On the shores of existing lakes certain parts are marked by extensive beaches containing abundant reserves of good building material.

Attention is also directed by the Report to some artificial sands made by crushing soft sandstones, suitable for special purposes such as glass-making and iron-smelting.

Moulding sands are found in the vicinity of Hamilton and Ontario. It is seldom more than two or three feet thick, appearing generally as a deposit under the superficial soil, when this soil comes in contact with an underlying sand formation. It seems to owe its origin to the circulation of water and to the action of vegetable and other organic life. It occurs in different grades of fineness, the coarsest material being used for large and rough castings, while very fine moulding sand is used for brass and copper castings. As, says the Report, this is a high-priced sand which can be exploited without expensive equipment, "there is a possibility of developing a considerable industry in this material for Canada.

Glass sand, which should be as pure as possible, is sometimes obtained directly from the pits, and sometimes as at the plant of the Oneida Lime & Sand Company near Hagersville, is prepared by crushing a more or less disintegrated sandstone. This particular product is prepared from Oriskany sandstone of Devonian age, which after crushing and washing contains sometimes as high as 99.5% of pure silica.

Some of the Ontario sands appear to be suitable for the manufacture of silica bricks, a product that is badly needed in Canada, but no instance of their manufacture in Ontario was noticed in the Report, although the suitability of the sands for this purpose is pointed out, and analyses of typical quartz sands are given.

An interesting quartz occurrence is located at Bellevue, at mile 21 on the Algoma Central Railway. From 6,000 to 8,000 tons a year of this material is shipped, principally for the use of the Algoma Steel plant. The rock has a faint pink tinge. It sells for $1.25 to $1.50 per ton at the quarry, and freight costs about 40 cents. The rock analyses 97.25% of silica, and 1.86% of iron, with traces of alumina and lime.

The Report contains numerous well-chosen and typical photographs, and like all the Ontario Bureau of Mines publications, is well printed. The Province of Ontario is apparently well supplied with sands and gravels, of differing characteristics, and of considerable applicability to the arts and to the industries already existing in Ontario.

Complete lists of the producing deposits are given, with names of operators, class of product and output, and a full index to the monograph is appended.

BUREAU OF MINES REPORTS ON GOLD AREAS.

The Ontario Bureau of Mines has just published reports on the Abitibi-Night Hawk Gold Area and the Larder Lake Area. The former is the work of C. W. Knight, A. G. Burrows, P. E. Hopkins and A. L. Parsons. The Larder Lake report is by Mr. Hopkins.

The Abitibi-Night Hawk Gold Area.

The Abitibi-Night Hawk Gold Area is the name given by the Ontario Bureau of Mines to that part of Northern Ontario embraced by geological map No. 286. The area is roughly bounded on the west by Frederick House river. Night-Hawk Lake is in the south-west corner of the map and the town of Cochrane in the north-west corner. The eastern boundary is the Ontario-Quebec provincial boundary.

The western half is crossed in a south-easterly direction by the T. & N. O. Ry. of which the terminus is at Cochrane. From Porquis Jct. the Porcupine branch runs south-easterly, and a short line runs north-westerly to Iroquois Falls on the Abitibi River where a great pulp and paper plant is located. From east to west the northern part of the area is traversed by the Canadian National Railway.

In considerable part of this area the predominant rocks are altered, volcanic rocks, which the authors of the report call Keewatin greenstones. Since it is gold deposits in such rocks that are yielding nearly all the gold that is being mined in Ontario the geological staff of the Bureau during the field season of 1918 devoted its attention to the mapping of this area. The map just published and the accompanying report indicate where the rock outcrops are and their nature. With this available the prospector will be able to use his time to greater advantage than before.

While little was known about the geology of the area, two important ore deposits had been developed; the Croesus gold deposit in Munro townships and the Alexo nickel deposit near Porquis Junction.

An unusual feature of the area is the occurrence of Keewatin lavas so little altered that a series of flows could be recognized. The authors found in Holloway township 14 distinct flows having a combined thickness of 4,400 ft. Features characteristic of the upper portions, middle and lower part of flows were readily observed.

In most cases where gold has been found in the area there are dykes of siliceous composition, such as feldspar porphyry, intruding the greenstones.

The authors of the report describe several gold deposits, including the Croesus, Howey-Cochenour-Willans and the Ratz. Some information concerning several other gold properties is also given. Reference is also made to nickel, chromite, pyrites and asbestos occurrences. Unusual magnetic declination was found in Frecheville and Rand townships.

The Larder Lake Gold Area.

The Larder Lake Gold Area described by P. E. Hopkins includes the properties of the Associated Goldfields Mining Company, and of La Mine d'Or Huronia, as well as a promising prospect on Sharp Creek in Heart township. Mr. Hopkins' preliminary report on the area was published in the Canadian Mining Journal. Some additional information will be found in the report just published.

Mr. Hopkins says of the rusty-weathering carbonate rocks in which the gold deposits at Larder Lake occur "rusty weathering carbonate rocks are found in or near many of the gold areas of Northern Ontario. This type of material has been prospected to a considerable extent in various parts of Ontario without yielding any producing mines. These rocks are more widely distributed in Larder Lake than elsewhere, and are important since they appear to contain a greater quantity of gold than the other rocks of the area.

R. E. H.

ENLARGING PLANT AT HUNTINGDON MINE.

The Eastern Mining and Milling Co., Ltd., which is operating under lease and option the Huntingdon copper mine near Eastman, Quebec, has placed orders for additional machinery to increase the capacity of the ore treatment plant. Developments at the mine continue favorably. The map showing the location and surface plant of the Huntingdon mine, illustrating Mr. R. E. Hore's article in last week's issue was omitted through a delay in transit, and will be found in this issue (see page 605.)

PERSONALS.

Mr. George R. Rogers has returned to the properties at Wasapika after a visit to Toronto.

Mr. G. C. Bateman has returned to Toronto from Montreal and New York.

Mr. F. M. Connell has returned to the Huntingdon mine after a brief visit to Toronto, where he ordered additional machinery for the mill.

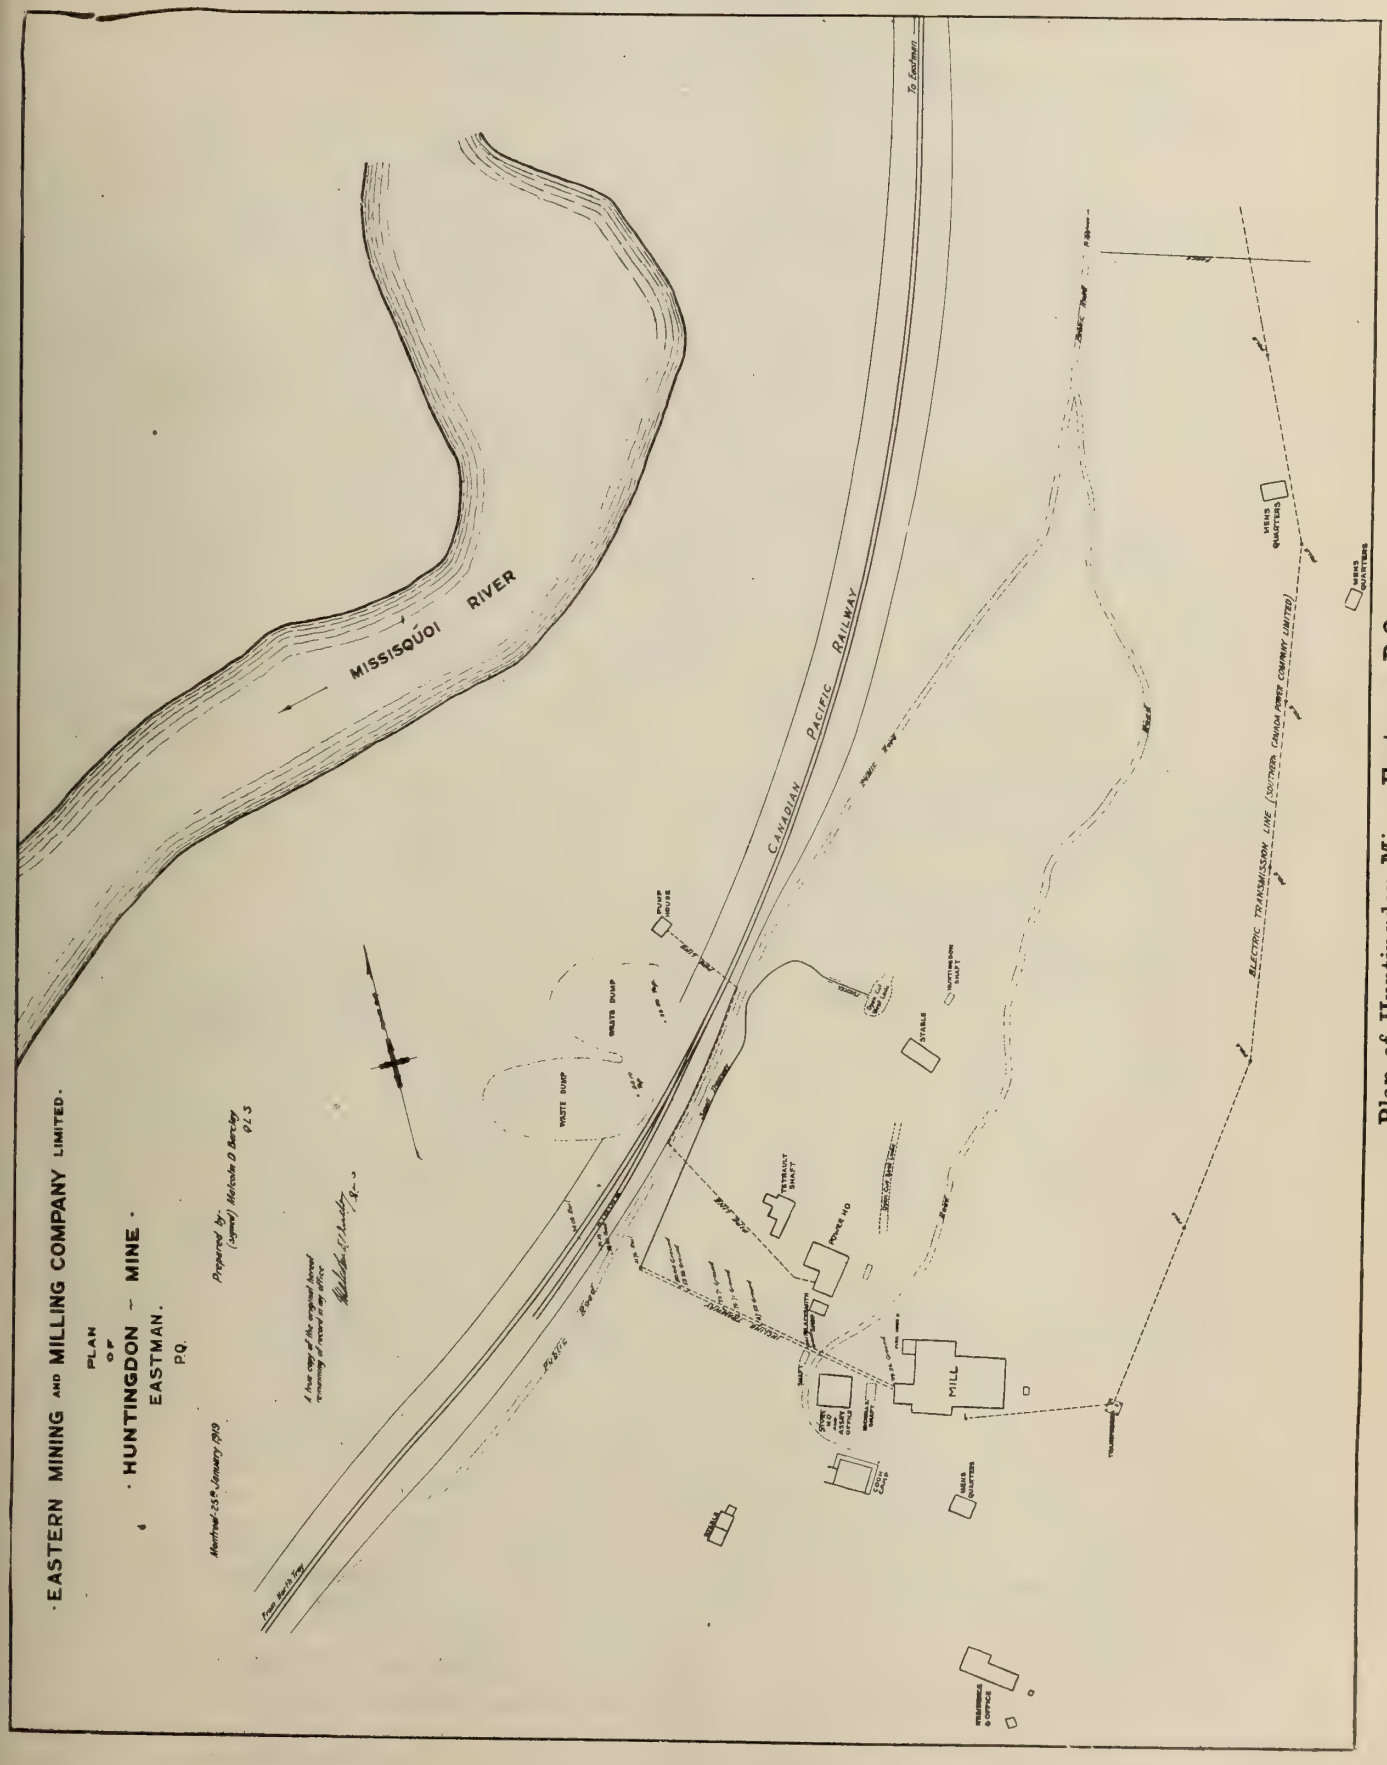
Mr. R. E. Hore is taking up professional practice as consulting geologist. His office will be, as at present, 1402 C.P.R. Bldg., Toronto. Mr. Hore will act as consulting editor for the Canadian Mining Journal.

Dr. W. G. Miller of Toronto, is one of the first Governors of the Imperial Mineral Resources Bureau which has been granted a charter of incorporation.

Professor H. E. T. Haultain is in Minnesota studying the Minnesota Mines Experiment Station.

BOUNTIES ON PETROLEUM

The amount paid in bounties on crude petroleum (the only bounties now being paid) in 1918 was $113,497 for 6,566,133 gallons, and for 1917, $101,428 for 6,761,886 gallons, the total from 1905 to 1918 being $2,791,937 on 183,462,142 gallons, as given in the Canada Year Book for 1918.



Plan of Huntingdon Mine, Eastman, P.Q.
(See Journal of August 6th, 1919, pp. 594-6.)

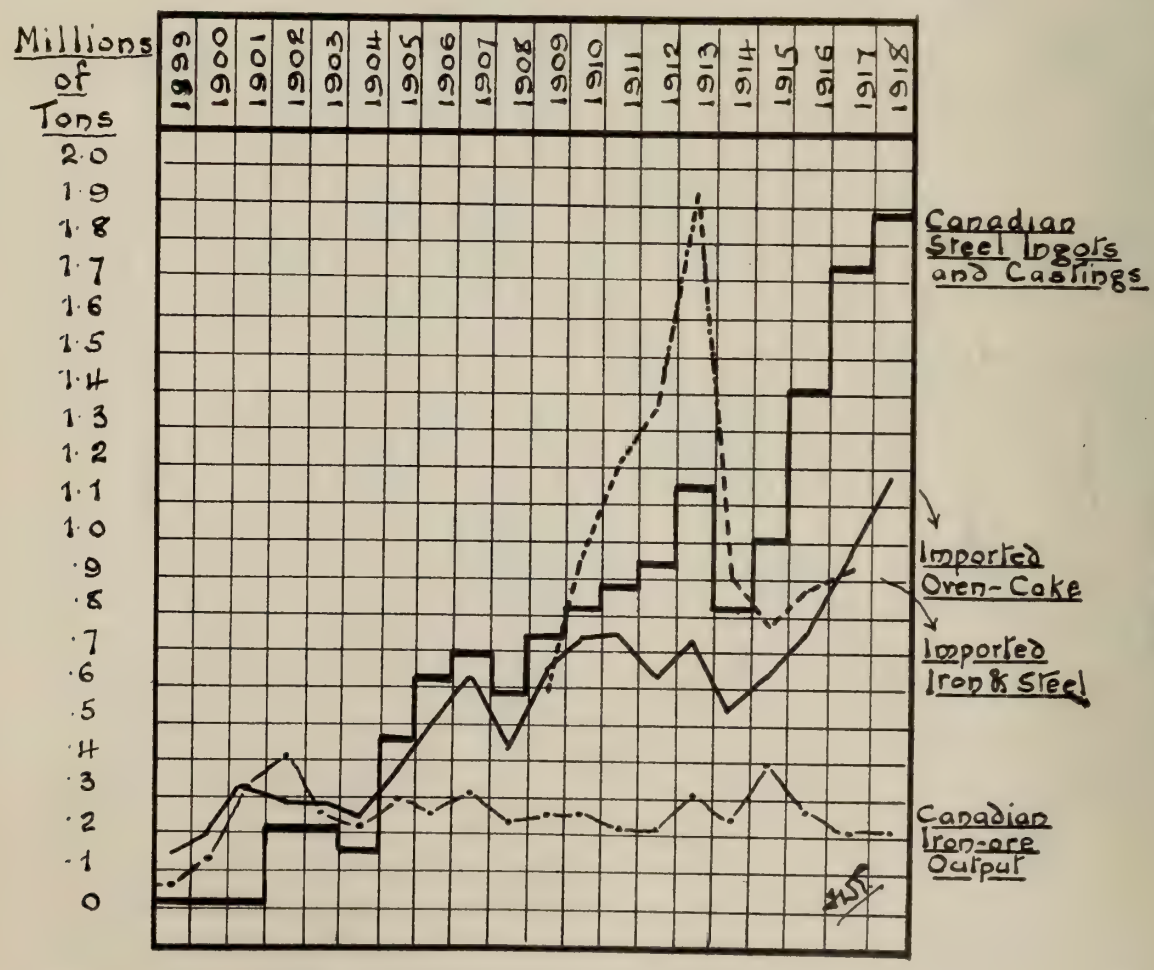
The Production of Coal and Iron Ore in Canada Considered in Relation to the Iron and Steel Industries

By the Editor, in "Iron and Steel of Canada."

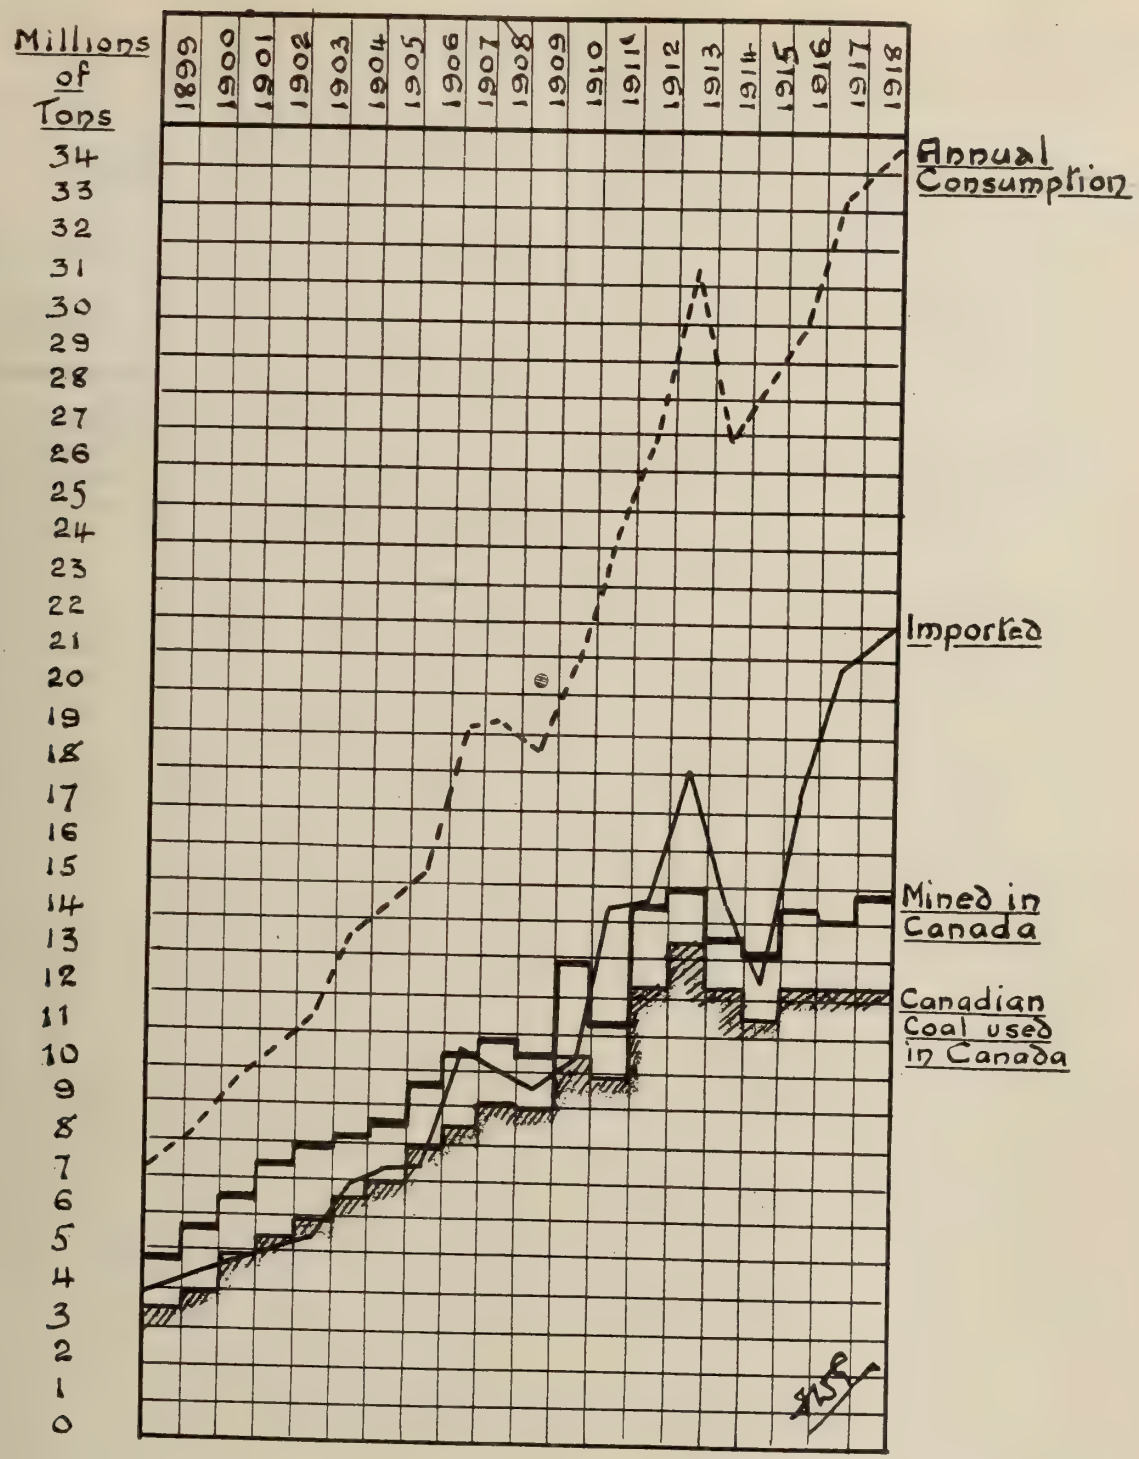
The two graphs accompanying are compiled from the Department of Mines statistics. The graph illustrative of Canadian coal consumption shows that up to about 1912 the Dominion was able to furnish from its own coal-seams a little better than half the tonnage of coal consumed for all purposes in Canada. Actually, however, this was not the case, as a certain amount of coal was exported, chiefly from the Cape Breton mines to Boston, Mass. During the period 1886 to 1899 the coal imported into Canada averaged a little over 54 per cent of the total coal consumption of the country. During the period 1899 to 1918, included in the graphs, the same percentage was maintained, but during the war period the percentage of coal imports has greatly increased. At the present time the imports have risen to 63 per cent of Canadian consumption of coal

The coal consumed in Canada during 1918 is estimated at 34,840,000 tons, the highest figure recorded in Canadian statistics, and most closely approached by 1913 when 31,582,545 tons of coal were consumed. The consumption per capita shows a steadily rising figure, and this is encouraging as showing Canada's progress in the industrial arts and in the conveniences of civilized life, but the discouraging feature diclosed by a study of the statistics is that the Dominion is rapidly increasing its importations of coal, at higher prices than have ever prevailed in the past, and at the same time the home production of coal, shows a stationary, and even a declining tendency. Any form of production in Canada that is stationary is unsatisfactory, and is equivalent to a declining production when viewed in relation to the general growth of population.

There is this difference between the jump in coal consumption that marked 1913 and the peak figure of 1918, namely that in 1913 Canadian coal-mines were increasing their outputs coincidentally with the



— Production of Iron-Ore and Steel Manufacture in Canada. —



— Production and Consumption of Coal in Canada —

increase in coal imports, but in 1918 the imports of coal are climbing without precedent, while domestic coal outputs are declining with no immediate prospect of manifesting an opposite tendency.

Turning to consideration of the graph showing tendencies in the iron and steel industry, it will be noticed that the tonnage of steel ingots and steel castings produced in Canada has climbed rapidly during the war period. This, of course, is a war condition, and does not represent the industrial growth of the Dominion with accuracy. Nevertheless, the peak reached by imports of iron and steel in 1913 is still higher than the record achievement of Canadian iron and steel plants in 1918, showing that a home market exists and that the producing capacity of the domestic iron and steel industry is required to fill Canadian requirements to a very important extent.

The curve of imports of furnace coke should be considered in relation to the imports of United States coal, and discloses that Canadian steel plants are largely dependent both for coal and coke upon an outside source.

The tonnage of iron-ore into Canada is not shown,

partly because no reliable figures are available, but also because it is unnecessary after inspection of the curve of Canadian iron-ore production. The production of domestic iron-ores is now practically confined to the Province of Ontario. Nova Scotia and New Brunswick, which in former years were important contributors to home production of iron-ores, now produce little or none. It should, of course, be noted that the ore used in the Nova Scotian steel plants, at Sydney and Sydney Mines is Wabana ore, controlled entirely by Canadian interests, but, at the same time, it would be incorrect to class this important part of the tonnage of iron-ore smelted in Canada as of Canadian origin. That is a possibility of the future, politically speaking.

With the exception of the years 1899 and 1900 it will be noted that Canadian production of iron-ore was smaller in 1918 than in any year of the period under review.

A summary of the tendencies disclosed by the graphic representation of statistics of the allied industries of coal and steel in the Dominion includes therefore the following points:

a. Decrease in home production of the essential raw materials of coal and iron-ore, accompanied by a rapid increase in importations of these materials, including a notable increase in the importation of coke.
b. A rising tendency in the importation of iron and steel products into Canada, accompanied by a maximum production of steel in the Dominion, with the probability that a falling-off in steel production may be looked for during 1919. It is not, however, certain that a corresponding decline is likely in imports of iron and steel.

The conclusions to which these consideration would appear to lead is that Canadian steel producers should strenuously cultivate the home market, which appears to have a purchasing capacity worth cultivating.

It appears equally desirable and feasible that Canadian coal producers should strive to lessen the recently developed inequality in the ratio of imported coal to coal mined in Canada. Admitted that a certain tonnage of anthracite coal is probably required for domestic use because of its greater cleanliness, there is yet a large market for bituminous coal in Canada that is being filled to-day from United States sources.

Apart from the fact that raw materials obtained from outside sources provide employment in that outside source and not in the country where they are used—at least not in the same proportion—there is the further consideration that we are to-day paying for imports with a depreciated currency.

In a lecture recently delivered to the staff of Barclay's Bank, in London, Professor Nicholson says with reference to conditions in Great Britain:

> "We are suffering in the first place from "over-importation. During the war a great "part of this over-importation was of the "greatest national benefit. The imports from "America were necessary for the conduct of "the war. But an increasing part of the aggre- "gate money value of these imports was due "to the inflation of the currency and the as- "sociated rise in prices. This part was not a "blessing—quite the contrary."

While a wholesale application of Professor Nicholson's statement is not justified in regard to all the considerations set out in the foregoing remarks, yet in relation to the coal consumption of Canada, the statement is one of fitting exactitude. In brief, we are importing altogether too much coal and we are purchasing it at an increasing disadvantage.

Special Correspondence

BRITISH COLUMBIA.

Cork-Province Increases Capital.

The capital stock of the well known Cork-Province Mines, Ltd., of Kaslo, B.C., has been increased from 1,000,000.00 to $1,250,000.00 and the par value is now $1.00 instead of 10c.

There has been an offer made for 400,000 shares, which is the balance of the Treasury stock, but before this offer will be accepted the stockholders will be given until Sept. 15th to take these shares up at 25c per share. If not taken up by the stockholders by that date the offer will be accepted.

The proceeds of this sale will be used in development work, part of which will be used to develop more power, and thus be able to operate on a 24-hour basis.

Nelson.

The Inland Mining Company has bonded the Eureka Mines, situated on Eagle Creek from the Eureka Copper Mines, Limited. The amount involved is $60,000, of which $17,000 has been paid. The same company has the Granite-Poorman property at Granite, B.C., under bond and proposes to operate the two properties. Already the Granite mill is operating on Eureka ore. Improvements to the Granite-Poorman plant are proposed among which is the extension of the tram-line from the mill to the Eureka workings. The Inland Mining Company is composed of mining men of the State of Washington, H. H. Vinvent of Walla Walla being manager, and Alfred Bachtold of the same city, secretary. The mine superintendent is B. Crilly, of Nelson, B.C.

From the Sheep Creek camp, where there is at present considerable mining activity, comes the report that two good showings have been located on Fawn Creek, one of the principal tributaries of the Sheep. The larger of these is on the Iron Dollar group owned by Neil McColman and Murdoch McLeod, who have been doing development work on the vein for a long time. Recently they have opened up the lead in a new place where it has a width of twenty feet and shows considerable milling ore and some shipping ore. On the headquarters of the Fawn Creek is the Wonderful group held by Mr. Phil Billings. Mr. Billings has sunk a small shaft on lead which now is twenty feet down and the ore has consistently improved. Fawn Creek is one of the lower tributaries within the Gold section of the camp.

Good progress is being made in driving a long tunnel on the Queen Mine, Sheep Creek. This is now in over 1,200 ft. At a distance in of 700 feet the tunnel crosscuts the Yellowstone vein and it is expected to catch

its objective the Queen Vein, at about 1,500 ft. From the intersection of the cross-cut with the Yellowstone vein, a drift has been carried in an easterly direction for 200 feet, proving the ore on this vein to be variable in grade. A W. McCune, who has the entire Queen property under bond, from the Queen Mines Incorporated, is responsible for the foregoing information. The object of the present development is to gain depth on the Queen vein, which has produced much good milling ore in the past. The Queen has a twenty stamp mill and a compressor, both operated by water power.

The Orinoco group of mineral claims in the Nelson district is reported to have been sold to United States capitalists for $60,000. A considerable body of copper silver ore has been exposed by ground sluicing and open cutting.

West Kootenay.

The Perrier Group of mineral claims, situated near Nelson, B.C., are being examined by Trevor Starky, the mining engineer of London, England, on behalf of capitalists who are considering bonding them. The proposed financial consideration has not been stated but it is said that if the negotiations are consummated, between $50,000 and $60,000 will be available for the further development of the property. These claims have been opened up to the extent of sinking a shaft on hundred feet, drifting 150 feet, and a small raise. Some difficulty was experienced at the outset with water which necessitated the installation of a hydraulic automatic pump. Ore and concentrates shipped in the past amounts to about 40 or 50 tons, and about $4,000 has been taken out in the form of bullion. The ore is averaging about $14 a ton.

Another property near Nelson, B.C., receiving attention is the Emerald Mine on Iron Mountain. A small concentrator with a capacity of 30 tons of ore running two shifts a day is to be installed.

Sandon, B.C.

The Blue-Bird and Rawdon claims on Reco mountain, near Sandon, B.C., have been purchased by Clarence Cunningham and associates, from the Montgomery heirs in New York for $35,000, under a bond and lease for three years. Operations already have commenced in developing and putting the property on a shipping basis.

It is reliably reported that the Rambler-Cariboo Mines has purchased claims adjoining its present holdings. The property which is situated near Three Forks, B.C., consists of two claims, the price of which is said to be in the neighborhood of $75,000. The claims acquired contain about 1,600 ft. of the vein from which the Rambler-Cariboo Company has produced a considerable quantity of good paying ore.

A strike of some importance is reported to have been made on Silverite property, owned by Clarence Cunningham. In drifting on the vein an ore shoot has been encountered with high values in silver. This property is situated in the vicinity of the old Queen Bess mine, out of which Mr. Cunningham made a considerable stake.

Revelstoke, B. C.

O. T. Bibb, president of the Multiplex Mining and Power Company, speaks very optimistically as to the future of the district adjacent to the town of Revelstoke, from a mining standpoint. He says that excellent progress is being made in the development of the Woolsey group of claims, and that the Lanark mines at Illicellewaet is also showing up well. This property has been under development for a number of years, and the company has installed a modern concentrating plant. Recently a new body of ore was discovered which decidedly increased the output. Some shipping, both of ore and concentrates, has taken place. In the North Bend District (north of Revelstoke, the Mastodon Mine, which was closed down for a time, has again opened up. This is a silver, lead and zinc proposition. In the Lardo district several parties of engineers are at work who are interested particularly in properties in the neighborhood of Goat Mountain. Prospects are being inspected by other parties in the Fergueson and Trout Lake Districts. Mr. Bibb states that his company proposes installing a concentrator on its property near Revelstoke as soon as possible.

The Silver Creek mineral claims situated near Revelstoke have been bonded to W. H. Eldridge, formerly of the Trail smelter, who proposes to proceed with developments.

Marblehead Quarries to be Reopened.

Having been closed down practically throughout the war the quarries of the Canadian Marble and Granite Works, located at Marblehead, will be reopened immediately. G. B. Wilson, the manager, recently returned from the east, where he was in conference with James Carruthers, his principal. Mr. Wilson has left for Marblehead with a crew of men to commence sawing operations. In a short time a polishing crew will be employed. A considerable quantity of stone is already quarried and only awaits finishing. The huge seam or bed of marble at Marblehead, said to be really almost a marble mountain is unique and one of the wonders of the country. A thoroughly modern plant was installed some years ago. It includes at the quarry derricks, oilers and hoisting engines, three drills and three channelling machines; at the mill four gangs for sawing marble; in the polishing shop which is operated by electricity generated by steam power, rubbing bed, planer and polishing machines; and machine shop.

Merritt, B.C.

The Aberdeen Mine on Ten Mile Creek is being unwatered preparatory to a careful examination of the property by engineers representing British interests, while T. J. Corwin, manager of the Aberdeen Mine Syndicate, is not prepared to make a statement as to the property's future, it is understood that in the event of the engineers making a favorable report, finances will be available for the reopening of the mine and equipping it with a concentrator and a mill.

Kaslo, B.C.

The Index Mine, situated on the South fork of Kaslo Creek is to be provided with a very complete operating plant. The equipment includes compressor, Pelton wheel, rails and ore cars. A dam and water flume already has been constructed. There are four leads on the property which are being developed by a crosscut, which is now in the first lead and which ultimately will give a depth of a thousand feet on the fourth

lead. The first vein has a good width of milling ore with a shoot of twenty to twenty-four inches of pay ore, which is now being sorted for shipment.

Fort Steele, B.C.

Gold placer mining operations are being carried on at Wild Horse Creek, near Fort Steele, on a considerably larger scale than for the last few years. The Gamble Company, after a twelve days' run, closed down operations owing to a break in the flume line on Boulder Creek. To test the ground a clean-up was made while the repairs were in progress, with results more than satisfactory. The Wild Horse Dredging Company, with leases covering the bed of the Creek from Kootenay River up about five miles, is working steadily to get its machinery in operation.

Trail, B.C.

The announcement has been made that James J. Warren, who has held the office of General Manager of the Consolidated Mining and Smelting Company of Canada for a number of years, has been elected to the Presidency of that company. Mr. Warren's preferment has created favorable comment throughout mining circles in this province.

Grand Forks, B.C.

A compressor plant has been installed at the Maple Leaf Mills Franklin Camp. H. W. Young, the Manager, states that work will start immediately in the further development of the property. Two shifts will be employed in driving the tunnel which now is in some sixty feet, it being planned to do several hundred feet of tunnelling in opening up the property. The Union Mine, of the same camp, also is being energetically developed.

Yale, B.C.

Diamond drilling operations have been started on the property of the Aspen Grove Amalgamated Mines, Limited. Surface indications promise an extensive zone of medium grade copper ore and to prove this it is the intention of the company to do some 10,000 feet of drilling. The drilling started by the Provincial Government on the Snow-storm Group in Highland Valley continues and the results so far are promising.

Cowichan, B.C.

The Lenora property, Mount Sicker, Vancouver Island, has been bonded by G. B. Turner, representing New York interests, and there are indications promising a revival of copper mines in that district. It will be remembered that the operations of the Lenora Mines ceased years ago when the property appeard to be exhausted. Mr. Turner, however, has started a shaft from which he intends to cross-cut the formation north of the fault, an area left untouched by previous development. There are no indications of copper on the surface, but a small vein has been encountered. It is interesting to note that the Tyee and Lenora Mines combined have produced over $3,500,000 in copper and gold, of which $500,000 was derived from the gold recovered. Mr. Turner is reasonably sure that he is putting a theory to a practical test that will result in a renewal of mining activity in the Mount Sicker Section.

The B. C. Manganese Company, Limited, is developing the manganese products situated near Cowichan lake. A railroad is being built to connect the E. & N. Railway with the mine. Bunkers are being constructed at the mine and a water system has been installed. Already contracts have been arranged to start shipping almost immediately to the Bilrowe Alloys Company, Tacoma. The company has also been asked by the Canadian Consolidated Mining and Smelting Company, Trail, B.C., for a supply of manganese ore. Dr. T. L. Walker, Professor of Mineralogy, University of Toronto, visited the property recently and commented very favorably upon it.

Portland Canal.

There is no section of British Columbia attracting more attention in a mining way than Portland Canal. Hon. William Sloan, Minister of Mines, recently made a tour of inspection of the district. From Stewart he went inland to Salmon River and visiting the Premier, Big Missouri and other mining properties of the locality. On his return he spoke very optimistically of the outlook. He reported that development is in progress not only on the Premier but also on the Big Missouri in which Sir Donald Mann is interested, and on other first-class prospects. Mr. Sloan stated that in order to facilitate the opening up of the mineral resources of this section considerable road construction is necessary. The owners of the Premier mines were building eleven miles of road from Hyder through American territory to the Boundary line. The Provincial Government would assist in the building of the road from that point to the mine and also in the opening up of roads and trails to other properties in the vicinity. He observed that there could be no reasonable doubt that the prosperity following successful mining operations would mean a material expansion in trade. It was the opinion therefore that Canadian merchants should be alive to the opportunity offered. The Dominion government was spending a considerable sum in the construction of a wharf at Stewart and the British Columbia administration was constructing a road from Stewart to Hyder at an expense of approximately $30,000. It will be seen, therefore, that the Government realize the importance of providing necessary transportation. He concluded by stating that present indications were that some of these properties would develop into first-class mines and that the whole district was rich in mineral resources. Mr. Sloan also visited the smelter of the Granby Consolidated Mining and Smelting Company at Anyox, B.C., and travelled over the Grand Trunk Pacific as far as Smithers, where he was in consultation with a number of mine operators of property situated on Hudson's Bay Mountain. He promised that the Government would extend some assistance towards providing roads and trails to the Colorado and Victory mining claims as well as other properties situated in that district.

Alice Arm, B.C.

The railroad from Alice Arm to Dolly Varden Mines has been completed, and the loading chutes on the company's wharf have been finished. It is not expected to be long therefore before the Dolly Varden is again on the shipping list.

The LaRose mine has started active operations and the North Star should be shipping at an early date. The latter has a good tonnage of ore on the dump. The Vanguard Group also is being put in shape for shipment of ore while the United Metals Company has open-

ed up a face of lead and grey copper ore that is reported to assay very highly. The Joplin Mineral claims, the ore of which goes high in silver, is being developed with encouraging results.

One of the most interesting mining deals of the year is the reported bonding of George Copper Mines in the Beaver River section of the Portland Canal Division to the American Smelting and Refining Company. These mines consist of ten claims situated six miles from the terminus of the Portland Canal Short Line Railway. Three mineralized belts have been explored on the property and are known as the Blue Vein, the White Vein and Green Vein. The Blue Vein comprises three veins aggregating ten feet of quartz in a fifty foot mineralized belt. The belt has been traced by open cuts for a thousand feet and the ten feet of ore averages $4.00 in gold and 3 per cent of copper. The white vein has been traced for tw othousand feet, measures four to six feet in width, and in places contains a high grade copper ore. Consideration is said to have been $1,000.

B. C. PERSONALS.

Mr. W. G. Trethewey, now of Sussex, England, but formerly of the Coniagas & Trethewey Mines of Cobalt, in which district he is well known, was a recent visitor to British Columbia.

Mr. Trethewey has been looking over some properties here. He is a great believer in British Columbia, and just as soon as conditions right themselves in England will probably locate in B.C. Like many other investors, Mr. Trethewey states that labor conditions will have to become more settled in England before any moves can be made to make active investments here.

Mr. Alexander Sharp, the prominent coal mining engineer of Vancouver, who has charge of M. P. Burns' property at Coalmont, has resumed practice again after 10 days' illness.

Mr. Sharp is to deliver a lecture on cheaper and better coal before the B.C. Chamber of Mines at an early date.

B. C. Chamber of Mines Will Exhibit at Fall Exhibition in Vancouver, September 8 to 13 Inclusive.

Arrangements are fast being completed for an exhibition of British Colmbia's mineral resources at the Fall show of the Vancouver Exhibition Association.

The Association is lending every possible aid to the B.C. Chamber of Mines, to make this exhibit a success. They have given the Chamber of Mines space for the use of nearly all of one of the principal buildings right near Hastings Street Entrance to the Park. This means that the first thing the visitor will see is the mineral exhibit.

Everything is being done by the Chamber of Mines to make this exhibit exceptionally attractive. It is planned to have an assay furnace in actual operation, also many other features that will demonstrate actual operations in connection with the mining industry.

Exhibitors Please Note: A hearty invitation is extended to those wishing to exhibit specimens of British Columbia minerals from any section of the Province. Same may be shipped care of the "Mining Exhibit, Vancouver Exhibition Association, Hastings Park, Vancouver, B.C.," and the Association will pay the freight or express charges on same.

Exhibitors should bear in mind that it isn't the size of the specimen, but the quality that counts. Have a full description of specimen, location of property and any other particulars of interest with name of owners. Mark everything plainly so there will be no confusion in properly marking exhibit.

Mine Supplies.—Manufacturers of mine supplies and equipment firms will also exhibit and there promises to be one of the best supply exhibits ever held. Much machinery such as drills, etc., will be in actual operation. All firms wishing to exhibit will do well to get in touch with the Secretary of the British Columbia Chamber of Mines, Dominion Bldg., Vancouver, B.C.

Cobalt Strike

UNION EXECUTIVE REJECTS PROPOSAL OF SOLDIERS' COMMITTEE.

Cobalt.—After a full discussion on the local strike situation with the Minister of Labor, the deputation of returned soldiers returned from Ottawa on the seventh, and reported to a mass meeting of the returned men. They informed the meeting that the Minister of Labor would, on the request of either party to the dispute, appoint a Board of Conciliation, with full power to bring about a settlement. The findings of such a board are, of course, not necessarily binding on either party unless mutually agreed upon, but the Deputy Minister pointed out that in at least nine cases out of ten a board of this kind has successfully obtained its objective. If either party refuses to appoint a representative, the Minister of Labor will name one to represent that party.

The Deputy Minister further pointed out—and this point seems to have been completely overlooked at Ottawa — that the mine managers are an organized body, and therefore, that one Board of Conciliation can be appointed to cover all the mines in the camp, rather than having a board for each mine.

A Board of Conciliation cannot become operative unless all employees have returned to work.

The deputation therefore recommended that this proposal be adopted, since it meant that work in the mines could be recommended immediately, with a fair prospect of the ultimate adjustment of all points at issue.

The meeting then adopted the report, and instructed the committee to take up the proposal with the executive of the Miners Union, and, if they deemed it advisable, ask the Union Executive to hold a vote by secret ballot of all the workers in the camp as to whether they wished to return to work immediately, pending the result of a Board of Conciliation.

In the evening the committee held a meeting with the Union Executive. They pointed out that if the men returned to work immediately, pending a Board of Conciliation, a very great deal of hardship would be done away with, that work could be recommenced immediately, that even if the findings of the board were not binding, yet the chances were very strongly in favor of its findings affecting coming legislation in a manner beneficial to the workers, and that Cobalt and the surrounding district could look forward to a period of prosperity rather than one of depression and real hardship.

The miners' executive replied to the effect that, unless the operators conceded some points, they would not entertain the proposition, and that they considered it inadvisable to take a vote on the question of returning to work on the conditions proposed by the soldiers' committee.

metal

Continuous Operation Made Possible

TO eliminate shut-downs, MONEL Metal screens were used for supporting the filter cloth and MONEL Metal wire for winding the drums of the 20 Oliver Continuous Filters at the U. S. Ammonium Nitrate Plant, Perryville, Maryland. The action of the liquor was so severe that screens made of iron, copper or practically any other metal could not be used.

MONEL Metal wire wound spirally over wool fabric (see illustration) gave permanent service. One MONEL wire, taken off and rewound over new fabric nine times, was still in perfect condition for further use. This is a typical example of MONEL Metal's wonderful resistance to acids and its superiority over other metals for equipment used in the chemical field.

MONEL Metal is very generally employed in manufacturing parts of bleaching and scouring machinery and dyehouse equipment which come in contact with acids or strongly alkaline solutions.

MONEL Metal is a natural alloy of nickel and copper — non-corrodible — strong as steel — tough and ductile. Withstands acids, high temperatures and erosive action of hot gases and superheated steam. Can be machined, cast, forged, brazed, soldered and welded by electric or oxy-acetylene method. Takes and retains a perfect nickel finish.

In the mining field where corrosion is unusually injurious, MONEL Metal has proved its superiority over other metals for mine screens, coal chutes, valve trim, pump liners, pump rods and various other parts of mining machinery and equipment. Send for the MONEL booklets which tell all about this unique metal and the many other uses for which MONEL Metal has proved superior.

Write us for detailed information as to whether MONEL Metal could be substituted with economy and greater satisfaction than the material you are now using. Our Technical and Research Department is at your service. Address:

Test of the Fleet Process of Electric Smelting.

Having the financial support of the Provincial Government to the extent of a grant of $2,000 the Vancouver Magnetite Iron and Steel Smelting Company, of Vancouver, B.C., has arranged for a test of a new electro smelting process which, it is hoped, will prove that the magnetite ores of British Columbia can be treated electrically with the assurance that the quality and cost of the product will permit it to meet competition in the open market. This company, of which J. H. Fraser, of Vancouver, is the managing director, is the owner of the Ronaldsay plant, Howe Sound. The experiments, by arrangement with the B. C. Electric Ry. Company, are being facilitated by the use of the latter's old power plant at Highland Station. The Provincial Government, through the instrumentality of the Minister of Mines, has shipped a quantity of magnetite ore from Texada Island properties. Wm. M. Brewer, District Mining Engineer, has had charge of this work which he reports to have been completed. The furnace is expected to be blown in on or about the 6th of August. Representatives of the Department of Mines are to be in attendance. Wm. D. Fleet, of Montreal, is the inventor of the process on trial. He was superintendent of the Canadian Copper Smelting Company at Sudbury, Ont., for six years and later installed the electrical equipment of the hydro plant of the Calgary Power Company at Kananaskis and Horseshoe Falls. Subsequently he was a member of the Manitoba Public Utilities Commission.

It is interesting to note in this connection that general interest in the problem of developing the iron and steel industries in this province continues. The Hyatt Steel Products Company reopened its rolling mill at Port Moody recently after temporary embarrassment due to a strike. Several improvements have been made to the plant, as a result of which it is possible to turn out both a larger quantity and a better grade of steel than heretofore. Public sentiment is behind the proposal that these small firms and any other concern which might be induced to launch an iron and steel industry should have every encouragement. Many think that the Dominion Government should supplement the bonus now offered by the Provincial Government on pig iron produced within the Province from local ores. They take the position that if the resources of Canada are to be developed this basic industry must be stimulated, pointing out that less than five per cent of Canadian iron enters into iron and steel products manufactured in the Dominion, although there are unlimited quantities of raw material available.

An editor can feel grateful for such freedom of his pen as comes from the fact that he is called upon to write on matters that do not affect the pocket nerve of his advertising supporters. Such detachment—not degenerating, however, into vacuous aloofness—is the best guarantee of reasonable independence; absolutely independent no human being can be, for every man has prejudices and pre-occupations that color his views of life; but we confess that the editorial ideal, expressed though it may be with some lack of literary refinement, is the truly American notion of living so as to be able to look any man in the face and tell him to go to hell, most politely, most politely.—Mining & Scientific Press.

BARTER.

Bills of exchange and sight drafts fade afar,
With tedious detail of the ocean trade;
And dreaming I can see past foam and bar,
Primeval barter; in this eastern raid
Essential oils and simsim seeds are spread
For gleaming cutlery and iron bars;
And eyes strain westward where the sun sinks red,
Seeking a market under alien stars.

Textiles are asked in trade for caraway,
And coriander for enameled kid;
In ardent Africa the merchants pray
For roaring motors; in their eager bid
They offer almonds and pistachio
And dates conveyed through distant desert haze
On patient camels rocking to and fro,
Through far, entrancing, slow Algerian days.

Thos. J. Murray in the New York Times.

PRESIDENT OF THE INSTITUTION OF MINING ENGINEERS VISITING CANADA.

G. Blake Walker, the President of the British Institution of Mining Engineers is visiting Canada and the United States, and is expected to arrive at Quebec about the 23rd of August. Mr. Walker is one of the best known mining engineers in England. He is a charter member of the Institution of Mining Engineers, past President, and Hon. Secretary of the Midland Institute of Mining & Mechanical Engineers, and the recipient of a number of medals from the technical societies in Britain in recognition of his services and the interest he has taken in the problems surrounding the safety of coal mines.

The Deister Concentrator Company of Fort Wayne, Ind., have had prepared for distribution a very interesting map of Europe revised to show the new boundaries agreed on by the Peace Conference in comparison with the old outline of all countries. It bears the imprint of the Deister Concentrator Company from a publicity standpoint, and will be sent free to any of the readers of the Journal on request of the company.

SALES ENGINEER—With connections among Mines and Mills in Northern Ontario, wants position with live concern manufacturing Mining Machinery and Supplies. Salary and commission. Write in first instance to Box 10, Canadian Mining Journal.

EDITORIAL

THE WORK OF THE BUREAU OF MINES GEOLOGISTS.

During the past few weeks there has been in the "Toronto World" a great deal of criticism of the work of the Ontario Bureau of Mines. The criticism is quite unfair to the geologists employed by the Bureau. Very good work is being done, as many who have used Ontario Bureau of Mines reports and maps will bear witness. The Province is getting a lot more out of these men than it is paying for. The real cause for complaint is that a larger number of such men are not available for the work.

The mineral resources of Ontario are being more and more rapidly developed. It is regrettable that the Bureau of Mines has not a large enough staff of geologists to enable it to have promising areas mapped at a speed in keeping with that of exploration, but that is the fault of the province, not of its present employees.

No men have a better reputation among mining men than the chief officials of the Ontario Bureau of Mines. Mr. T. W. Gibson, the Deputy Minister, is known here and in the United States as an exceptionally competent director. Dr. W. G. Miller, the Provincial Geologist, is not only a distinguished geologist, but is a leading figure in the mining industry. It is true that he has been recently spending more of his time in England than in Ontario, but the province needs a capable representative there and no one is better qualified to bring Ontario's mineral resources to the attention of the Imperial Resources Bureau than is he. We would be glad to see him back on his job in Queen's Park, but it is idle to say that in his absence the Bureau is not doing good work.

Most of Ontario's metalliferous deposits are in pre-Cambrian rocks. The geologists of the Bureau — Knight, Burrows and Hopkins—are successfully studying and mapping these formations. There is more to be done than they can do in a reasonable time, but they should be given credit for what they are doing.

We could say more in praise of the work of the Bureau of Mines if we thought it good policy. Being convinced that the work should be speeded up in order that development of our mineral resources may come more rapidly and more intelligently, we are not so anxious to direct attention to the past activities of the Bureau as to the future. We need more work of the kind that is being done. The quality is satisfactory, but there are not enough workers to produce the desired quantity. Every year's delay in the development of our mineral resources means a loss to the province. If the writer in the "Toronto World" would give the Bureau proper credit for the work that it is doing, we would welcome his direction of the "World's" readers to the necessity of the province making a great effort to achieve faster progress.

CO-OPERATIVE RETAIL ASSOCIATIONS.

Dr. McFall, the Dominion Cost of Living Commissioner accuses the Retail Merchants' Association of openly and secretly opposing the growth of co-operative retail associations, and in doing so he discloses a thing that has been well known to those interested in co-operative stores.

The attitude of the Retail Merchants' Association is one that interests mining companies, as the hostility of the merchants has been extended to mining companies and corporations operating retail stores with the object of reducing the cost of living to their employees. A recent example of this policy is the intention of the gold companies at Timmins to operate a co-operative retail store with the express intention of reducing retail prices.

The Dominion Coal Company and the Nova Scotia Steel & Coal Company for many years have done the same, and throughout the war period these stores exercised a salutary and steadying influence on retail prices. Naturally, this excited the opposition of the retail merchants, who were almost able to promote legislation prohibiting the coal companies from operating their stores. No grounds were advanced for such action by the legislature except the deterrent effect of the competition of the company stores upon retail profits, and strange as it may seem, the Legislature of Nova Scotia were on the eve of acceding to the importunities of the retail merchants to abolish the company stores, and the merchants have still much hope that their efforts will eventually remove these stores as competitors.

The extraordinary presumption of the merchants went even further, for they asked that co-operative retail associations should be prohibited, and opposed the incorporation of co-operative societies in Nova Scotia. It seems strange that a body of men presumably so well-informed as the retail merchants should have so elementary a knowledge of the unassailable right of a group of persons to incorporate for any form of business that is not against the public interest or actually felonious, as to dare to publicly oppose the formation of a co-operative society, but it actually was done.

More effective than the public opposition of co-operative associations, however, is the secret policy of wholesale and retail men in refusing to sell goods to co-operative societies. The wholesalers are compelled to such a course of action by the attitude of the retailers, but it is well-known to co-operators that much of the difficulty experienced by co-operative buyers in Canada is occasioned by the secret understanding that exists amongst retailers that co-operative societies are not desirable from the retailer's point of view and are to be discouraged by every possible means.

In Great Britain the same hostility was experienced, and the co-operators were forced into commencing a wholesale society, which is now familiarly known as the C. W. S. and has achieved world-wide influence.

The Commissioner believes that the new law restraining combines in Canada may make it possible "to compel the retailers to refrain from threatening to boycott wholesalers and manufacturers who sell to co-operative associations." We should hope that it may be possible to do this. It does not seem a great deal to ask. Co-operation is not an experiment. It has proved very effective in saving the services and the profits of the long line of middlemen, commission agents, jobbers and retailers that do the distributing work of commerce. If co-operation dispenses with any of these interpolations between the producer and the consumer, it is so much to the general public good. The middleman, of all grades, is only a useful member of the community in so far as he performs a service. To that extent he is entitled to reward, but if the middleman should become obsessed with the idea that he has a vested interest and some occult right to profit from the purchases of the public, irrespective of the necessity for his services, then he becomes an incubus, a parasite, and will in due time meet with the fate of all things and institutions that perform no useful purpose.

THE CANADIAN NATIONAL RAILWAYS AND THE PURCHASE OF NOVA SCOTIAN COAL.

In a letter addressed to the President of the Canadian National Railways, Mr. D. D. MacKenzie, the member for Cape Breton North, pleads eloquently the case of the Nova Scotia coal mines in requesting a larger allotment of the coal purchases of the Canadian Government Railways.

Mr. MacKenzie touches upon the two main reasons for the present exclusion of Nova Scotia coal from its usual markets, namely, the shortage of ships occasioned by Admiralty requisition, protracted beyond all reason; and, secondly, the great drain upon the colliery working organizations, and their permanent impairment caused by heavy voluntary enlistments and an unusual percentage of casualties among the miner-soldiers. The late leader of the Opposition concludes by writing:

> "I must with all respect, yet with all insistency, impress upon you the necessity of coming to the assistance of these men by purchasing the article which they produce, whether or not it may be more expensive than the same article imported from a foreign country. This is not only a national question but an imperial one. . . . The reasons you gave for not buying more of our coal do not measure up to the gravity of the situation involved."

The reasons given by Mr. Hanna for not buying more coal from Nova Scotia than was needed in the Eastern Lines section of the C. N. Railways, east of Levis, or thereabouts, was that Nova Scotian coal cost much more than American coal.

Is the cost of an article, purchased by a national enterprise for national services the true measure of economy or statesmanship? Nova Scotian coal is costing more because of the sacrifices in life and services made by Nova Scotian miners, and because of the admirable manner in which the foresight of Nova Scotian coal owners had provided cargo carriers so excellently adapted to the Admiralty requirements that they were requisitioned early and released late. American coal is costing less than Nova Scotian coal because it will always and did always cost less to mine, and because, thanks to the draft system and the lessons learnt from our experience, the United States coal mines were not drained of productive labor, but, on the contrary, the U. S. Government went to extraordinary pains to conserve and increase the production of what they realized to be the most essential raw material for war purposes. In other words, the United States coal trade benefited by Canadian sacrifices, and it is rather a poor return for the injuries that the war inflicted upon the coal trade in Nova Scotia, that because of the preferential position now occupied by United States coal operators, **occasioned by these same injuries,** Nova Scotia should be called upon to suffer further injury.

But, admitting that the Canadian National Railways can save large sums of money by buying United States coal in substitution for Nova Scotian coal, what does that really amount to? Do we not owe sufficient money to the United States already? Is not a five per cent premium on New York funds enough discount on the Canadian dollar to worry about? As we have pointed out in these columns many many times the importations of American coal are only exceeded in their tremendous increase by the deplorable halt in Canadian coal production, and it appears as if the Government itself were going to lead the procession towards the United States coal-heaps, and were going to set a good example by spending more money in the United States for coal that could be and should be produced in Canada.

If large numbers of men in Nova Scotia are thrown out of employment by the substitution of American coal, if sums for relief have to be voted by municipal, provincial and possibly federal agencies, if the royal-

ties of the Province of Nova Scotia are still further reduced by a still further diminishment of output, if more miners are compelled to leave Nova Scotia and go to the United States for a living, if the revenues of government accruing from taxation on exciseable goods and customs duties are diminished by unemployment, if the general commercial prosperity of Nova is diminished; and if all these benefits are transferred to the United States in the measure and extent represented by the tonnage of coal that is mined in the United States that should be mined in Canada, how does the country benefit, and where is the saving in money? Is not the saving an entirely fictitious one, existing only on paper, and represented as a material factor by an increased rate of exchange against Canada and poverty and distress within our borders?

If the reason given by the Canadian National Railways for buying United States coal in preference to Nova Scotia coal, or buying United States coal at all where coal is obtainable from Canadian sources, is that it costs less, then, as Mr. MacKenzie says, the reasons given do not measure up to the gravity of the situation. Very few people realize—even in Nova Scotia itself — how black the outlook is for the future prosperity of the coal trade in that province. It is one of the limitations of Nova Scotia that coal, in the nature of things, always did and must always cost much more to mine there than it does in the United States. This is a limitation Nova Scotia shares with Britain and other coal producing countries in the Empire. If the Canadian Government wishes to see coal mined in Canada, and to receive all the internal benefits that accompany coal mining, then the Government must accept the limitations of Canada, and not buy goods in the States because they are listed lower in dollars and cents, because that does not mean that they cost less. In these days money has a variable and often unascertainable value. If we persist in buying goods abroad, then we must be content to accept unemployment at home, and this, in turn will result in inability to pay for the goods purchased, or national bankruptcy.

SIR AUCKLAND GEDDES' SPEECH ON BRITISH COAL PRODUCTION.

The speech in which Eir Auckland Geddes presented the gravity of the coal situation in Britain attracted world-wide attention, and cabled summaries of the speech were contained in most Canadian newspapers. The coal question is one which concerns Canadian readers, not only because the commercial effect of the disappearance of Britain as a coal-exporting nation will extend to Canada, but because the questions that are in dispute between the miners and employers in Britain are the same questions that are being raised in Canada. Sir Auckland Geddes sums the matter up by saying: "The key of the position, the final key, rested with the miners, not on any Report, but by working."

There is a curious similarity in the statements of coal-miner leaders in all parts of the world. In Canada, in the United States, in France, and even in Germany, the colliery managers and coal-owners are accused of restricting output by inadequate and antiquated equipment, by inefficient management, and other sins of omission. The simultaneous discovery of the managerial shortcomings, and their simultaneous announcement in coal-mining districts so far separated as Alberta and Westfalia, as England and the United States, in language moreover that is identical in intent if not in phrase, is an instance of mob phsychology, or thought transference, or something more sinister, or else the mining engineering profession has undergone a remarkably widespread and consistent deterioration all at once.

However that may be, Sir Auckland Geddes' exhaustive setting-forth of the problems that face the British nation through the special and preferential treatment demanded by the miners contains much that is as pertinent to Canada as to Britain.

THE LIGHT RAILWAY.

In a recent number we suggested that a light railway such as was used in France might be advantageously constructed into the West Shiningtree and Wasapika areas. Such a railway would certainly be of great assistance to those who develop gold properties in this and adjoining districts and would enable operators to spend a higher percentage of their funds on the development of ore deposits.

A correspondent says: "One of the unquestioned successes of the war was the light railway and Canadian railway troops had their share in this success. Consequently, we have men who are experienced, and no doubt the Government if it wished could get plenty of applicants for employment of this nature. The light railways offers a cheap and speedy means of opening up the hinterland which in the near future will be a source of untold wealth to the present Canadian transcontinental railways and incidentally to Canada as a whole."

PERSONALS

Mr. W. E. Segsworth, is in Toronto having returned from an extended visit to England.

Mr. D. H .McDougall, President of the Nova Scotia Steel and Coal Company, has returned from a two weeks visit to Wabana Mines, Newfoundland.

Mr. G. Blake Walker, President of the Institution of Mining Engineers (Great Britain) is visiting the timber areas near Bonne Bay, Newfoundland, in which he is interested. These areas were acquired during the war by a syndicate of Midland coal-owners to provide pit-timber for the British collieries, but owing to shipping shortage it was not found possible to send pit-timber to England during the war period. With the close of the war, it is expected that the Company's plans will be followed out.

THE PRICE OF COAL

SIR AUCKLAND GEDDES' SPEECH.

The proposed increase of 6s. per ton in the price of coal formed the subject of debate in the British House of Commons on Monday, July 14.

Sir A. Geddes (President of the Board of Trade) said there was no ground for the suggestion that this increase in the price of coal was based upon political considerations. It was based upon a realisation by the Government of the very serious position by which the country was faced at the present time in connection with the supply of the main source of power. The causes that had been assigned for the reduction of output were numerous. It was quite wrong to suggest that all these causes were to be found inside the coal industry itself. There were many outside causes, and he proposed to look at those causes under two heads: first, the external causes, and then causes internal to the coal industry. Among the most important of the external causes was the present transport position in the country. Output was being checked at many mines because wagons were not forthcoming as required, the failure being in some cases extraordinarily serious. The records of the arrival of the general user wagons at some 40 specially affected pits showed that those 40 pits in pre-war loaded some 10,000 general user wagons in a week, in addition to privately owned wagons. At these same pits during a recent week it was possible to have present waiting for loading only some 700 wagons. That was, of course, not an average for the whole country; it was taking the worst group of cases where this factor tending towards reduction of output operated. As to why wagons were not provided, there were many reasons operating to strangle the flow from the collieries, one of them being that the coal, after being loaded on the wagons, was longer on them than it used to be, because they could not be cleared at their destination. As a result of the institution of the eight-hour day on the railways, there was less work being done, and the new men who were being taken on were not so well trained or so expert. A further factor was that the work was over sooner, and there was consequently a delay in getting the wagons back.

The Interdependence of Industries.

A great difficulty had arisen in connection with the whole of the railway system through the enormous freights which had to be charged for coastwise service and those in turn arose from changes in general conditions of employment. Much higher wages were being paid, and in some cases less work was being done. He laid stress on these points to emphasise the fact—the recognition of which was vital to the country at the present time—that less work being done in one industry reacted through that industry on to others, and we could not go on with anything like our old pre-war state if the work of the country was not done. At the present moment, for one reason or another, it was not being done. A most pernicious doctrine was being preached—that if a man did less work it left more work for others to do. The real thing was exactly the reverse. We had here an example of less work being done in industries outside mining, making it impossible for another industry to get the flow of its products away, and therefore checking back the work in that industry. That fact should be clearly recognized. This question of the interdependence of industries was complicated by other factors. For instance, the drought we had in the early summer was also a contributing cause to blocking back coal, as it caused a shortage of hay,and people who used to do carting, and in that way help to clear the railways were no longer doing that carting because it did not pay. That the fact had added to the difficulty of the coal output. Not only was the flow from the coal industry checked by conditions of labour and employment in industries outside itself, but the actual production within the industry was checked by conditions arising in industries outside itself. There was at present the greatest possible difficulty in getting forward to the mines the steel rails, the machinery, and the tubs which they required, and those difficulties were accentuated by a change in the hours of labour and the amount of work done per day in the steel and other industries. Consequently, it was not possible at the present moment to get the supplies of manufactured steel required for other industries. These were some of the outside factors. In short, you could not take an old country such as this, and suddenly profoundly change the conditions under which the majority of its peoplee lived and worked, without causing widespread disturbances outside the area of those changes themselves.

Inside Factors Reducing Outputs.

Inside the coal industry there was no doubt that there were factors at work tending to reduce output. As the result of the Government's adoption of the recommendations of the Interim Report of the Sankey Commission, the coal owners' profit was now fixed at 1s. 2d. per ton. It did not matter to them, therefore, how much a ton coal cost to raise, although the number of tons raised did matter. Taking the side of the men, wages were very much up. It was freely alleged that there were men working in the industry who found they had made enough in the course of the week, and did not go on to make more. He thought that was probably true. The figures of absenteeism in the mines suggested that something of that sort was happening. The White Paper stated the percentage of absenteeism due to sickness, injury and voluntary absence, shown as a percentage of the possible number of shifts which could have been worked, increased from an average of 10.7 per cent. in 1913, to an average of 12.5 per cent. in the first 20 weeks of 1919, and to an average of 13 per cent. in the four weeks ended May 24. That was another factor at work tending to reduce output. The Coal Control Department reported that absenteeism was less last week, but the figures showed that during the time covered by the White Paper there was an increase in absenteeism. There was also during the same time a reduction in the out put of mines for a period of four weeks, increasing from 19.8 tons in 1913 to 16.8 tons in the first 20

weeks of 1919, and to 17.1 tons in the four weeks ended May 24, during which period there were no holidays and few stoppages. For the last four completed weeks, excluding Whitsuntide, the output was 16.7 tons. Those last figures by themselves, of course, proved nothing, because there were factors operating from outside. But, as a result of those figures, there was no reason to doubt that there was still an unused capacity for output existing within the coal miners themselves, and that point was, he thought, fully conceded by a member, himself a miner, when he said that if there was a campaign to get an increase of work in the mines he was quite sure something would be done. This very wide range of causes in connection with the reduction of output was something which could not be put right at once, and something which no single man and no single body of men representing any one industry could put right by their own efforts. It must be a national effort to get this vital question of coal output put right.

Prices Compared

As a result of the reduction of output there must be some increase in price. The following figures showed where the money paid for coal at the pit-mouth went in 1913, and what consumers would have to pay after July 16, first of all per ton of coal raised, and secondly per ton of coal available for sale. The average pit price for coal per ton raised in 1913 at the pithead was 10s. 1½d., and the corresponding figure to-day was 26s. 0½d.; per ton sold the corresponding figures were 11s. and 29s. 3½d. Those figures were made up as follows: The 10s. 1½d. was made up of the following items: Labour in and about the mines, 6s. 4d.; timber and stores, 1s.; other costs, 11d.; royalties, 5½d.; owner's profits, 1s. 5d. That was for 1913. The corresponding figures to-day were: Labour, 19s. 5½d. as against 6s. 4d.; timber and stores 3s. 2½d.; other costs, 1s. 2½d.; royalties, 6¾d.; owner's profits, 1s. 2d.; compensation to owners for working, under the instructions of the Controller of Mines, mines which would not otherwise be worked, 3¼d.; and there was another penny required for administrative purposes in connection with coal, control, and the 1¼d. which we had as a surplus on the price. Now, taking the same things corresponding with per ton sold, because it was rather instructive to get these figures, the price in 1913 was 11s. Labour in that year was 6s. 10½d.; timber and stores, 1s. 1d.; other costs, 1s.; royalties, 6d.; owners' profit, 1s. 6½d. After July 16 the following would be the state of affairs: Labour per ton, 21s. 10¾d.; timber and stores, 3s. 7d.; other costs, 1s. 4¼d.; royalties 7½d.; owners' profits, 1s. 3½d.; compensation as before. It would be observed, then, that the increase of wages and reduction of output had resulted in two things—labour costs had increased by 13s. 1½d. per ton raised, or 15s. per ton sold out of the total increase of 15s. 11d. per ton raised, or 18s. 3d. per ton sold. This included nothing but labour in and about the mines, actual labour associated with getting the coal. The figures were taken from the evidence given to the Sankey Commission by the Coal Mines Department. They were sifted by the Commission, and the actual figures were those for the September quarter of last year. To those figures had been added the necessary amounts to cover such increases as those resulting from the application of the Sankey wage and the increased cost resulting from the return of men to the mines, who, although back, were not sharing to the same extent as those who were there before in output. The other costs, timber stores, etc., were adjusted to the actual cost at the present time.

Tracing the Cost to the Consumer

Tracing the cost of coal through actually to the coal seller and consumer in London, and taking 29s. 3d. as the cost actually paid for the coal at the pit mouth, he found that the coal should be sold in London, and was sold in London, for 49s. 6d.; 20s. 3d. marked the increase on the cost, and that was distributed as follows: First of all, the pit price, 29s. 3d. The average railway rate to London was 6s. 4d.; wagon hire, 1s. 6d.; loaders' wages, 1s. 9d. per ton; carmen's wages, 1s. 10d. per ton; other cartage charges, 2s. 7d. per ton; loss on smalls, 7d.; sacks replacement, 5d. per ton; railway siding rents, demurrage, etc., 1d. per ton; salaries, etablishment charges, and the various administrative costs in connection with the offices of the factors and retailers, 3s. 6d. per ton; and the profit distributed between the factor, which amounted to 4d. per ton, and the actual small retailer, or between two, or perhaps even three factors and the last man, 1s. 8d. per ton on the average. In 1913, for this particular coal, best Derbys, the pit price was 13s. and the London price 27s. The railway rate was exactly the same as to-day, 6s. 4d. per ton; wagon hire was 1s. against 1s. 6d. at present; loaders' wages 11½d. against 1s. 9d.; carmen's wages 10½d., against 1s. 10d.; other cartage charges 1s. 0¼d., against 2s. 7d.; loss on small. 4d. against 7d.; sacks, 1½d. against 5d.; railway siding rents, demurrage, etc., exactly the same, 1d.; salaries, establishment charges, 2s. 4d. against 3s. 6d.; and the profit 10¾d., against 1s. 8d. That profit, of course, excluded the 1s. 2d. fixed profit allowed to the coal owner. In the last group of figures, the price delivered to the consumer, there was as yet no allowance for any increase in carriage resulting from the various increases of costs by which the railways were faced, of which one, of course, was the increased price of coal. The present price of delivery in London, or in any town or port in Great Britain, was a subsidised price—the Government was subsidising the delivery. Moreover, the actual cost getting was subsidised still, and would continue to be, by the foreigner, because they were carrying into those figures still the subsidy derived from the export profits, and that subsidy was falling in amount day by day. If it disappeared altogether, the price of coal would be up another 1s. 4d. at once.

Everything Dearer.

Following from the increased cost of coal, we had at the present moment to face a rise in the price of our pig iron of anything from 15s. to 20s. a ton, perhaps more; in steel and finished iron, an increase of 25s. to 30s., perhaps more. Coke would be up 10s. a ton; spelter, £2 a ton; gas, 6d. to 9d. per 1,000 ft.; electric power, 0.2d. per unit; paper, 10s. a ton; glass, 5 per cent to 10 per cent; textiles about 4 per cent; bricks, about 5 per cent.; machinery, about 12 per cent.; chemicals generally, about 10 per cent.; some of them, such as caustic soda, sodium sulphide, and bleaching powder, from 20s. 30s. and 50s. a ton. This question of the increase of price in coal was of the most grave and serious nature for the whole nation. Not only were we losing our subsidy from export coal, but we were going to lose our national earnings from exports. Rails in Britain before the rise in coal cost £16 a ton; after the rise £17 10s. a ton; and in the United States

to-day £10 a ton; ship plates, £17 15s. a ton before the rise in coal; £19, the probable new price; American price, £14; crown bars, £21 a ton before the rise in coal; £22 10s., probable new price; American price, £11 15s.; pig iron, Cleveland No. 3 foundry, before the rise, £8; after it, £9; and No. 2 Pittsburg, £6. These figures must make everyone realize how grave was the crisis with which we were faced, because we lived by nothing else than our exports, and our export trade was gravely threatened by this position which has arisen.

The Key Figure.

The White Paper showed some of the figures on which the decision to raise the price of coal was fixed. Obviously the key figure was the output of coal during the coming 12 months. The only way to determine what that figure would be was to base the estimate on experience of actual output, either for 20 weeks of this year (as in the White Paper) or 26 weeks of this year, or a selected recent period. There was a good deal to be said for each of those bases. If factors determining the possible output of coal were all confined to the coal industry, and strictly limited to it, it might be possible to say, "Well, by goodwill, by the same sort of patriotic leadership of the miners which they got from their leaders during the war, they could get the output up at once." No amount of work on the part of the miners could get the output of coal up to the figures we wanted, although they could get it up a long way, until we had got all the other things right. So that we were absolutely bound to look at the factors which surrounded the coal industry in deciding what estimate to take. On the basis of the 20 weeks of the early part of the year, the estimate would be 217 million odd tons; or on the first 26 weeks of the year, 216 million tons; whilst for a selected four weeks, when all these factors were concentrated upon the output of coal, the estimated output was 214 million tons. The estimates involved one factor which had been followed from the Sankey Report, viz., whilst the actual hours were being reduced by 12½ per cent., the reduction of output was only taken as 10 per cent.; but with the factors outside the coal industry operating upon it, he was not sure that that 10 per cent. only might not be rather optimistic. With those estimates they had taken the 217 million tons figure to work on, which showed a deficit of £46,600,000 upon the working for the coming year. Those figures were handed in to the Coal Commission, and had been before the public, for weeks, but there had been no serious criticism of them. That £46,600,000 was 4s. 3d. per ton on all the coal raised, but it was related to a tonnage of 161 millions, which would be affected by the increase because there was the coal used in the collieries—18 million tons—on which it was no use putting 6s. a ton even for book-keeping purposes. There was also the miners' coal, which was part of the miners' wages; and then there was the coal for export and bunkers sold at open market price above the minimum, viz., 32 million tons of coal which were already earning more for us than they would earn if the 6s. were put on.

Cost of Coal Control.

In addition to that there was the cost of the coal control, at present 0.7d. per ton; but in view of all the new circumstances and new difficulties, another 0.3d. per ton must be allowed for coal control, which would make the future cost 1d. per ton, which would make miners, not on any Report, but by working."

5s. 10½d. as the absolute necessary increase to get a balance. To that they had added 1½d. in order to give a slight margin according to that estimate. Another estimate was got at in a different way: worked out from the actual subsidised cost—subsidised by ex- to obtain from the figures actually in possession of the Coal Control, and which were given to the Sankey Commission. Taking the 216 million tons basis, and port trade—at the pit mouth, a relatively easy thing knocking off the 18 million tons used in the collieries and the six million tons for miners' cottages—from which, by the way, there was derived a revenue of almost exactly £1,200,000— there remained 192 million tons for commercial disposal. The subsidised cost of raising this 192 million tons was £281,250,000. Knocking off the £1,200,000, left £280,000,000. Domestic and industrial use absorbed 157 million tons. The present average pithead price obtained for the coal was 22s. per ton, equal to £172,700,000—leaving a balance of £107,350,000 to be obtained from the sale of coal for export and bunkers. For these purposes and on this basis there would be only 35 million tons available. At present the prices for this export and bunker coals ranged from 15s. per ton for the poorest quality, small broken dross, up to 90s. per ton. Last year's average was 29s., at present the average price was 39s., but unfortunately our diminished exportable quantity was having the effect that the average composition of our export and bunker mass was deteriorating. Trade returns for June 1917 showed that the small coal exported amounted to 535,000 tons, a ratio of roughly 1 to 4. This year we exported 724,000 tons of small, and only 1,500,000 odd tons of large, a ratio of 1 to 2, so that the average price that we were getting for out export coal was falling because the quality of the composition of the mass of the coal was less good than before; and as the amount of coal we had to export declined, the composition got worse. So they were estimatin for a price of 35s. for our export on the average, as against 29s. last year, and 39s. at the moment. That meant that we might expect to receive £61,250,000 for our export and bunker coal. When that had been deducted from the £107,000,000 which ought to have been paid for by export, we were left with a deficit of £46,100,000. This deficit, according to this method of calculation, had to be spread over 157 million tons, and it worked out at 5s. 10½d. per ton, which, with 1d. per ton for coal control, gave 5s. 11½d. These two different methods checked each other, and both pointed to the 6s. increase in the price of coal if the country was prepared to go on subsidising its domestic coal out of the profits of its exported coal.

Foreign Competition

It was rather dangerous to imagine that during the coming year we were going to have a great deal of coal to export at a good price, because competition was getting very keen. American coal f.o.b. Atlantic ports was almost exactly 20s. and America was nearer some of the places to which we sent coal than ourselves. Another competitor was oil. On the West Coast of South America the shortage of patent fuel coal had the effect of establishing oil in the market. During the war the American oil companies made contracts for three years with various consumers who used to be patent fuel coal at 10s. per ton delivered, and now the three years' period has terminated the American oil companies had intimated that they were prepared to contract for one year for 70s. per ton of

oil, which was worth two tons of coal calories. That was some of the competition we had to face, and also the fact that the Americans were now offering long term contracts, and if we had also to offer long term contracts our profits must be further reduced because the price would have to be lowered. So one could only say that, though we were estimating on a 6s. per ton rise for coal, we were doing it knowing that we were taking a very considerable risk in having underestimated the amount that we ought to put on, because the 6s. was arrived at after allowing full credit for about 1s. 4d. subsidy derived from our export trade.

The secretary of the Miners' Federation of Great Britain had issued a statement to the Press to the effect that the Coal Controller on June 3 estimated the output for the year 1919 at 230,606,000 tons, and the deficiency for the year ending December 1919, after providing the owners with a guarantee profit of 14 millions, at £36,900,000, and that this sum, spread over 230,606,000 tons output, equalled 3s. 2.4d. perton, whereas Sir A. Geddes would increase the price to the consumer by 6s. per ton, even when advised that the arithmetical deficit was only 3s. 2.4. Now, no part of that deficit of £36,900,000 so far had been raised from the price of coal; it had been met from the taxpayer or borrowed money. If we were to pay the whole of that £36,900,000 of this year, the increase in the price of inland coal on the remaining part of the year would have to be 9s. 2d. per ton. Another point which had been made strongly was that in the past there was an increase—described as a useless or unnecessary increase—in the price of coal of 2s. 6d., as a result of which the Government has been alleged to have made a large profit out of the coal industry. That transaction had not been fully understood. In the spring of 1918 it was ascertained that the Coal Mines Agreement Act was being worked at a loss, and the accounts up to March of 1918 showed a deficit at the rate of six millions per annum. In order to make the agreement self-supporting it was necessary to impose a charge of 2s. 6d. in June 1918. It had been said that the Government was profiteeing out of the people of the country. Nothing of the sort; it was preventing international profiteering. The profits that were made out of the 2s. 6d. rise at that time were profits made from overseas. For example, we had during the war to get large quantities of goods from neutral countries for which high prices were asked, and in fact we got those goods by bartering coal, the only way that we could keep the price of those things which we were buying anything like reasonable was by charging, in the arrangements for barter, a larger sum for the coal. That was the source of the so-called profits. They were not profits in a sense, but they were going against what the Government was paying for stores in the war. These sums of money only passed as a matter of book-keeping through the coal industry, and on the international basis that money was absolutely required to meet our war charges accruing overseas. The actual arrangement, so far as the industry at home was concerned, was that after the half-crown was on there was 1s. 6½d. profit per ton of coal available for the mine owners in this country. The mass of money which passed through the coal industry—it was not taken from the coal industry, but passed through—at that time was altogether coming from outside the country, and was part of the general adjustments in connection with international bargain. These possibilities of so-called profits no longer existed. We had not got the coal to export. Our ships would have to go out in ballast if they were to come back bringing iron ore, or whatever it might be in the way of raw material. If we had not exports to send out—and we should have few if coal, iron, and finished iron and steel were dear—the exchanges must go more against us, and we must be placed in a position of having to pay more for all our food. He would urge that the present was no time for any section of the community, or for the Government to think that its interests were separate from the interests of the whole lot. To get through the dark and anxious days which lay ahead we must get back to the spirit which we had during the war. It was no good anybody saying that anybody else especially was to blame, excepting on one thing, and there the blame was heavy if it could be proved in any way whatever. The men who were to blame at the present time were those who were not doing their best to get production, to get output, to get the cost of production down, by increasing its bulk.

Appeal to Miners' Leaders.

That at the present moment was the most urgent need of every department of our national life, and that was the point upon, which the miners, the actual workers in the mines, could do more to help the country than in any other way to get ahead, and whatever the other difficulties outside the industry might be, or of getting the coal away from the mines, let us see that the maximum amount of coal was got out of the mines that could be got. He would ask the leaders of the miners to go down to the men they know so well and say to them: "This is no time for doing less than the maximum you can do." He would ask the leaders of the other section of the community to say the same thing to their people; but, because coal was the basis and principal source of our power, its shortage, its dearness, affected us more than the shortage or dearness of any other thing except bread. Therefore he would ask every man who had influence with the miners, if they saw, as they must see, and know that many of the men who had the chance were not working, and many who had a limited chance were not working to the limit of their chance. If they would work to the limit of their capacity, then he had little fear that it could be possible for them soon to say: "The output is rising so well that we may run the risk of bringing down the price of coal." If the output went up, they would be only too glad and willing to meet the rising output by a fall in the price of coal. If the output could be got up, he thought he might say on behalf of the Gevernment that as the output rose they would only be too glad to get the price of coal down 6d. a time, or some small amount, in order once again to get our industry freed and our export cheap. But unless we got coal, and unless everybody really would do all he could to get the output, and unless men of other industries would do all they could to free the circulation of goods in the country, to get up the supply of things required for the miners, there would be great difficulty. The key of the position, the final key, rested with the miners' not on any report, but by working.

Mr. Robert Bryce, of Toronto, is leaving for British Columbia. He will be away for about three weeks.

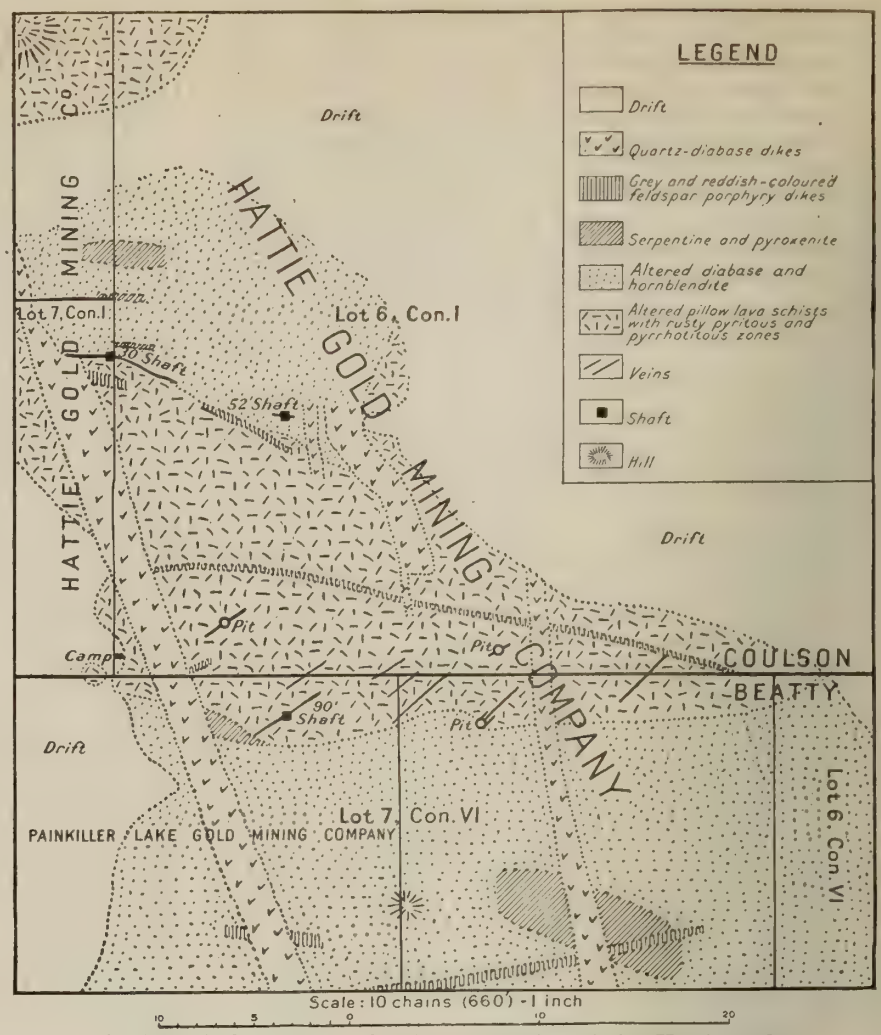
GEOLOGY OF PAINKILLER LAKE AREA

A part of the Painkiller Lake area has been mapped in detail by the geologists of the Ontario Bureau of Mines. The accompanying sketch map from a report just published shows the properties of the Hattie and Painkiller Lake gold mining companies and will be of use as a key map for adjoining properties.

The veins occur in altered volcanic rocks. The numerous narrow gold-telluride-quartz veins in the area are practically all parallel, striking north-east. "The veins, which are usually about one inch in width, are not always closely spaced, and the intervening area contains few or no cross fissures.

The minerals are gold, tellurides, pyrite, chalcopyrite, pyrrhotite, galena, zinc-blende, quartz, chlorite, sericite and calcite. Large east and west veins of mispickel, pyrite and quartz carrying low values in gold represent another type of vein."

The Painkiller lake area is in Coulsin and Beatty townships, Temiskaming, Ontario. The lake is about ten miles northeast of Matheson, a town of the Ontario Government railway.



Geological sketch may showing properties of the Hattie and Painkiller Lake gold mining companies, townships of Coulson and Beatty.—Bureau of Mines.

DR. COOKE'S REPORT ON DAVIDSON PROPERTY MATACHEWAN AREA.

(A Correction.)

In our July 16th number we published a resume of an article by H. C. Cooke on the Matachewan Gold Area. Unfortunately some paragraphs were omitted and the description of the Matachewan Gold Mines property came under a heading intended for the description of the Davidson property. The sketch maps which accompanied the article and the introductory paragraphs made it obvious that the property being described was the Otisse; but some newspapers reproduced the article without the maps and introductory paragraphs and consequently the incorrect heading was then more misleading. Dr. Cooke said of the Davidson deposit in part:

"On the Davidson claim the ore body is a portion of the porphyry itself. The porphyry is cut by a multitude of veinlets of auriferous quartz mostly less than one quarter inch in thickness, and spaced at intervals of approximately a foot. The porphyry has thus the character of a stockwork, although the veins in the main are not reticulating, but possess a subparallel arrangement evidently the result of jointing according to a definite system. Such jointing and enrichment has taken place mainly in the coarser-grained, more slowly crystallized phases, located, in general, toward the centre of the intrustive. Where the grain is finer, jointing and enrichment has not occurred. The hypothesis advanced by Spurr, that the last portions of a magma to crystallize are rich in water, and hence must contract considerably on cooling with formation of joint cracks, may be the explanation of this phenomenon.

"Channel samples taken along the bottoms of trenches in the enriched areas by the engineers examining the property are said to have yielded values varying from $5 to $25 per ton.

"The gold appears to be chiefly present as the native metal, although it is difficult to tell whether this was its original form, as development has not gone below the oxidized zone. However the lack of limonite around many of the grains of gold would indicate that it is not residual from the oxidation of pyrite. Whether the pyrite also is auriferous has not yet been established. The gold is found principally in the narrow veins of quartz that intersect the porphyry, but grains of gold have been occasionably found within the porphyry itself, although never more than a few inches from a veinlet."

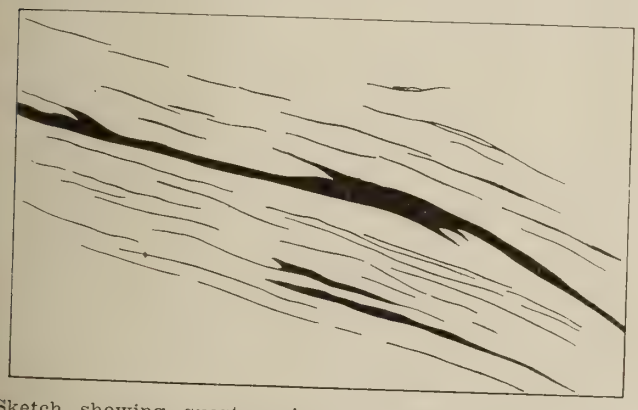
THE HOWEY-COCHENOUR-WILLANS GOLD DEPOSIT

In the recently issued report on the Lightning River area the geologists of the Ontario Bureau of Mines describe the deposit on the Howey-Cochenour-Willans property on which some work has been done. The accompanying sketch, taken from the report shows the lode structure at a depth of 35 feet. There is a "main persistent quartz vein, varying in width from an inch to 10 or 12 inches, with an average width of about 4 inches. Roughly paralleling this main vein there are a number of narrow veinlets, usually less than an inch in width, and more or less discontinuous, the whole partaking of the character of a sheeted zone produced by shearing that accompanied the formation of the fault. This zone varies in width from 2 to 3 feet." The quartz vein is in basalt at the westerly exposure and in rhyolite at the eastern. The shaft following down the vein dip of 23° was started in basalt and entered rhyolite at about 50 feet. Information furnished by J. W. Morrison, who was in charge of operations, indicates that the deposit lies along a fault of the thrust type.

"The quartz for the greater part is of a milk white color and, where not fractured by secondary movement, is rather coarse grained and characteristic of primary quartz in veins. Where the primary quartz has been granulated, usually in a direction roughly parallel with the walls, there is an abundance of secondary calcite with pyrite and a small amount of chlorite. Some pale colored zinc blende and galena are also present."

"The gold usually occurs in a fine condition with the pyrite, but samples from the main vein often contain gold in the quartz visible to the eye."

"Near the veins the wall rock, which is a basic lava, has been greatly altered by circulating waters to carbonate and chlorite, and is penetrated by veinlets of quartz, calcite and chlorite."



Sketch showing quartz veins at Howey-Cochenour-Willans gold prospect, Holloway township; east walls at depth of 35 feet in shaft. The length of vein system in sketch is about six feet. The main quartz vein is shown by the heavy black part; parallel stringers of quartz occur on each side of the main vein.—Bureau of Mines.

Mr. J. E. Spurr has been appointed editor of the "Engineering & Mining Journal," New York. Mr. Spurr is a geologist who has been notably successful in applying geology to mining. Recently he has been in charge of Mineral Investigations of the U. S. Bureau of Mines, a special staff having been engaged on this work for war purposes.

THE MACKENZIE RIVER BASIN

A map and report that will be very useful to those who explore the Mackenzie River Basin in Northwestern Canada has been prepared by Charles Camsell and Wyatt Malcolm and published by the Geological Survey of Canada. Mr. Camsell has had much field experience in this large area and those who explore it will do well to provide themselves with copies of the report.

As the area of the Mackenzie basin is about 682,000 square miles and the greater part of it practically unexplored, it would be a tremendous task to prepare a geological map of the basin. The purpose of the present compilation is to give a concise statement of the present knowledge of its economic possibilities, particular attention being given to the geological features and possible mineral resources.

The area shown on the map extends from Edmonton, Alberta, north to the Arctic and from Prince Albert, Saskatchewan, west to the Pacific Ocean. It includes large portions of the provinces of Saskatchewan, Alberta and British Columbia and of Yukon and the Northwest Territories. The known waterways are mapped and along the chief waterways the geological formations are mapped. Prospectors will find much to interest them in the map and the accompanying report.

Bituminous Sands.

On the Athabasca river there is exposed an immense body of bituminous sands. In the report some of these beds are described in detail. The results of the investigations made by S. C. Ells are summarized. Mr. Ells is of the opinion that the sands can be successfully used as a basis for satisfactory asphaltic pavements.

Clays.

Some of the clays along the Athabasca have been studied. In the report a summary of the results of tests is given.

Coal.

Coal is being mined in the Crataceous rocks along the Canadian National railway which crossed the southern part of the area mapped. In this report attention is directed to the more remote and less known seams, which lie further north. Coal seams on the Smoky River in the Kootenay formation are high grade bituminous "and at least one seam on Smoky river may be classed as anthracite."

A large number of thin seams are exposed in the canyon a few miles above Hudson Hope. Small seams occur also in Peace River canyon and on Getling Creek. On Johnson creek twenty seams are exposed, but only four exceed 2 feet in thickness.

Lignite coal is seen at a number of places in the banks of the Athabasca for 62 miles above Fort Assiniboine. Coal occurs also on McLeod river and near Wolf creek. A number of other occurrences of coal in the area are mentioned in the report.

Gypsum

"Gypsum is exposed at many points in the Mackenzie basin. The deposits that are most likely to prove of commercial interest are those occurring on Peace river and in the escarpment to the west of Slave river."

Petroleum and Natural Gas

"Boring operations have been conducted along Athabasca and Peace rivers where strong flows of gas were struck in two or three wells, and petroleum bearing strata on Peace river have been penetrated.

Oil and gas indications are found in the sediments of Cretaceous and Devonian age, both of which are of wide distribution."

It is stated that "the possibilities of the Devonian sediments as a source of petroleum are worthy of consideration." From the point of view of the prospector the McMurray sandstone is so far as present knowledge goes the most important formation of Cretaceous age, in the Mackenzie basin." The writers summarized that little is known of the structure of the Cretaceous formations.

The report on petroleum possibilities is particularly interesting at this time because of the unusual activity in geological exploration for oil this summer. Areas as far north as Great Slave Lake are being carefully examined and drilled.

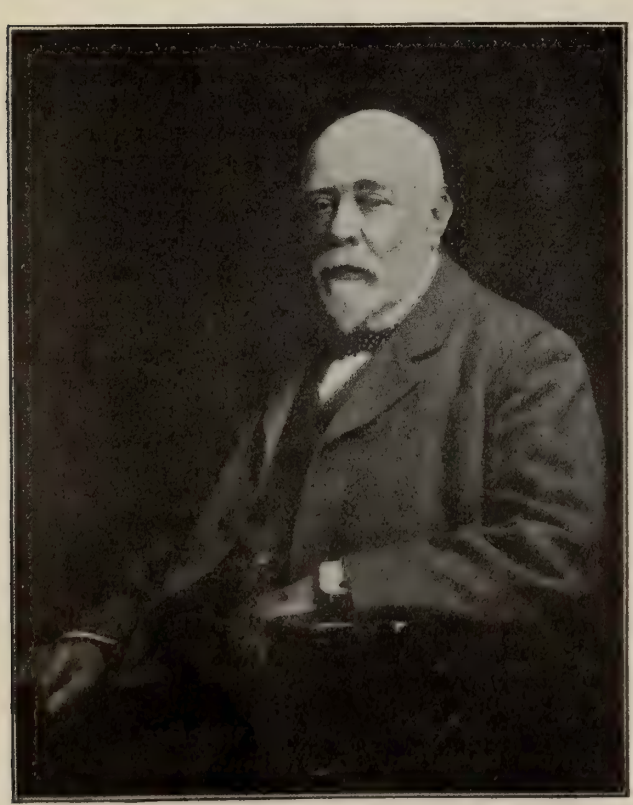
Salt

"Numerous brine springs are found in the Mackenzie basin, from some of which is obtained for local consumption." Several analyses of brine are given in the report.

Pre-Cambrian Areas

It will be noted that most of the known important mineral deposits in the basin are non-metallics. There are however Pre-Cambrian areas concerning which little is yet known. In the central and western part of the area mapped the younger formations predominate, but in the eastern third of the basin there are rocks such as enclose most of the metalliferous deposits of Ontario and the Lake Superior states. —R.E.H.

"It's a hard come down," says Walter Pulitzer, "that the country that produced William of Orange should have to continue to harbor William the Lemon." —New York Evening Mail.



GEORGE BLAKE WALKER, M. Inst. C. E., President of the Institution of Mining Engineers. 1918-1919.

LABOR AND SCIENTIFIC RESEARCH.

The American Federation of Labor adopted the following resolution at its Atlantic City convention:

"WHEREAS, scientific research and the technical application of results of research form a fundamental basis upon which the development of our industries, manufacturing, agriculture, mining, and others must rest; and

WHEREAS, the productivity of industry is greatly increased by the technical application of the results of scientific research in physics, chemistry, biology, and geology, in engineering and agriculture, and related sciences; and the health and well-being not only of the workers but of the whole population as well, are dependent upon advances in medicine and sanitation; so that the value of scientific advancement to the welfare of the nation is many times greater than the cost of the necessary research; and

WHEREAS, the increased productivity of industry resulting from scientific research is a most potent factor in the ever-increasing struggle of the workers to raise their standards of living, and the importance of this factor must steadily increase since there is a limit beyond which the average standard of living of the whole population cannot progress by the usual methods of readjustment, which limit can only be raised by research and the utilization of the results of research in industry; and

WHEREAS, there are numerous important and pressing problems of administration and regulation now faced by federal state, and local governments, the wise solution of which depends upon scientific and technical research; and

WHEREAS, the war has brought home to all the nations engaged in it the overwhelming importance of science and technology to national welfare, whether in war or in peace, and not only is private initiative attempting to organize far-reaching research in these fields on a national scale, but in several countries governmental participation and support of such undertakings are already active; therefore be it

RESOLVED, by the American Federation of Labor in convention assembled, that a broad program of scientific and technical research is of major importance to the national welfare and should be fostered in every way by the Federal Government, and that the activities of the Government itself in such research should be adequately and generously supported in order that the work may be greatly strengthened and extended; and the Secretary of the Federation is instructed to transmit copies of this resolution to the President of the United States, to the President pro tempore of the Senate, and to the Speaker of the House of Representatives.—Bulletin A. I. M. M. E.

PERSONALS.

Mr. R. E. Hore is examining mining claims in Churchill township, Sudbury mining division.

Lieut. H. K. Boysen, who went overseas with the R.A.F., and Miss Lorena Ferguson, of Haileybury, were married recently. They are spending their honeymoon at Barre, Mass. Lieut. Boysen was for some time on the staff of the Tough-Oakes mining company. He came to Toronto to learn how to fly, and soon became a capable aviator. He served on many battlefields. He says he will now give up aviation entirely and devote his attention to the mining business.

Special Correspondence

BRITISH COLUMBIA.

British Columbia Coal Production in June.

While the output of the coal mines of British Columbia for the month of June was not altogether satisfactory, it is gratifying to note that the Cassidy Collieries, Granby Consolidated Mining and Smelting Company, Vancouver Island, materially increased its output. The mines of the Crows Nest Pass of course made no production because of the strike, which has been in progress there for some time. It is expected that the Island coal mines will increase their output with the return to five full working days a week. The mines of the Western Canadian Fuel Company, The Canadian Collieries (Dunsmuir) Limited, and the Nanoose Collieries, have of late been working on what is known as slack time, about three days a week, but recently this has been extended.

The output for June in detail follows:

Vancouver Island Coal Production, June, 1919.

	Tons.
Western Fuel Company, Nanaimo Colliery ..	36,747
Canadian Collieries, Comox Colliery	35,357
Canadian Collieries, Extension Colliery	15,157
Canadian Collieries, South Wellington Coll.	5,124
Pacific Coast Coal Mines, Morden Colliery..	5,516
British Columbia C. M. C., East Wellington (Jinglepot)	3,420
Nanoose Collieries	1,412
Granby C. M. S. & P. Co., Cassidy	10,572
	113,305
Nicola-Princeton District.	
Middlesboro Collieries	6.091
Fleming Coal Company	2,963
Merritt Colliery	266
Coalmont	1,400
Princeton Colliery	1,184
	11,904
Northern District.	
Telkwa Colliery	158
Crow's Nest Pass District.	
Nil	....
Total	125,367

Victoria, B.C.

Privy Council Decide Foreshore Coal is Property of Province.

The Privy Council has upheld the judgment of Canadian courts that the coal lying under the foreshore within the Esquimault and Nanaimo Railway belt is the property of the province. The E. & N. Railway Company, it will be recalled, laid claim not only to all the coal within the railway belt proper, but all that might be found under foreshore lands. Their title was contested by H. W. Treat of Seattle, Washington, who has staked some foreshore near Chemainus and was proceeding under Provincial license to do some boring with the intention of developing the coal should it prove to be in sufficient quantity. When the Railway Company questioned his right and took the matter to the Court Mr. Treat was successful. The case, however, was appealed, but now with the Privy Council on record there is no further question of the validity of his claim.

Following the publictation of this result mining men are interested in the development of the coal leases at Oyster Bay and other points in the neighborhood of Chemainus. Mr. Treat is reported to have run through coal at Chemainus in two drilling positions. It has been established that there are large coal beds in this section, but whether they are available for commercial development remains to be established. It is understood that Mr. Treat and his associates propose to continue with their work, being confident that this foreshore coal can be mined at a profit.

Anyox, B. C.

When the Honorable William Sloan, Minister of Mines for British Columbia, was at Anyox recently, he was particularly interested in the new by-product coking ovens recently installed by the Granby Consolidated Mining Smelting and Power Company and the operation of which commenced some weeks ago. He said that the coal from the Cassidy Collieries, Vancouver Island, was producing the desired quality of coke and that while facilities for utilization of all by-products were not yet available, pipes were being laid which would permit the use of the gas and result in a considerable saving of fuel. The coal tar is being stored and will be marketed at various Northwest points for use in the manufacture of creosote. The benzol plant is fast being completed and will be the most up-to-date of its kind on the Pacific Coast. There are seventeen other by-products to be manufactured including ammonia, tri-nitro-toluol, toluol and dyes. Thirty ovens, each with a capacity of more than ten tons, are now making coke.

Fernie, B. C.

The situation developing as a result of the strike of coal miners in District 18, U.M.W. of A. (Eastern British Columbia and the Province of Alberta) has reached a stage of open conflict between the International Union and the One Big Union. It would appear that the men in the Crows Nest Pass field at least are willing to return to work and are anxious that an agreement should be negotiated with the mine owners. The latter, however, take a strong position against the One Big Union. They state that they are willing to come to a settlement with the men through the United Mine Workers of America but will have no "truck or trade" with the O.B.U.

That it is open war between these two organizations now is quite clear and it would seem that the men will be forced to make a choice. Recently the charter of District 18 of the United Mine Workers of America was revoked, an official statement to that effect being made from Calgary by International representatives Samuel Ballantyne, Samuel Caddy and William Dalrymple. This has put eight thousand miners who have been on strike in Alberta and British Columbia since May 24th outside the pale of the International Union. The International representatives mentioned wired the result of their inquiries into the Western Canadian situation to John L. Lewis, International President of the U.M.W. of A., as follows:

"Completed investigation today find District President is member of dual organization. Showed Committee his membership card (O.B.U.) Vice-President and Secretary Treasurer also lined up in favor of dual organization. We would advise that District charter be suspended at once. Awaiting early reply.".

In reply to this telegram the following wire was received from the International President:

"Message received. Wired H. M. Christopher (President of District 18 U.M.W. of A. today as follows: "As you are aware the International Executive Board directed Messrs. Ballantyne, Dalrymple and Caddy to conduct an investigation into the existing affairs in District 18 of the United Mine Workers of America and make recommendations to the international offices as to the matters of policy to be pursued in that District. This Committee has been pursuing its investigations and I am today in receipt of its recommendations that the charter of District 18 be revoked for good and sufficient cause. Accordingly I am hereby officially informing you that effective this date the charter of District 18 stands revoked and the District as such ceases its affiliation with the United Mine Workers of America."

As illustrating that there is a distinct difference of opinion as to the wisest course to pursue among the miners of the affected district, it may be noted that at Fernie on July 10th a meeting of the Fernie Miner's Union declared by a large majority in favor of negotiating a new working agreement as an organization of the U.M.W. of A., while from Calgary under date of August 2nd comes a statement by Ed. Browne, late Secretary-Treasurer of District 18 U.M.W. of A., that it has been decided not to turn the books of the Union over to the International officers. The latter, of course, made this request following the suspension of District 18, already referred to. Mr. Browne explained that this decision had been arrived at after a meeting of the Policy Committee, an executive board of the miners, who have constituted themselves into "No. 1 Mining Department of the One Big Union." Of this P. M. Christopher is the President; Alexander McFegan, Vice-President, and Ed. Browne Secretary-Treasurer. These officers to remain in office until the first constituted convention is called. "We are organizing the different locals under this heading" Mr. Browne observes, "and are now opened to do business. We have wired to Coal Commissioner Armstrong informing him of this and stating that we are prepared to negotiate for a settlement of the present strike, and also telling him that if this is not done he will be the man responsible. Any contract that we make will be fulfilled, and as for turning over any documents or anything else to the International representatives we wont do anything of the sort, and they will have to fight us all the way for their possession."

Broadly speaking, the situation is that many, in fact almost certainly the majority of the miners want to go back to work but are not likely to have that privilege at an early date unless something unexpected occurs tending towards the settlement of the present very sharply drawn issue between the U.M.W. of A. and the O.B.U.

Victoria, B. C.

T. H. Williams,who has been mine inspector at Fernie B. C. has retired and A. Strachan, inspector at Merritt, B.C., has moved to Fernie. D. McLean has been appointed inspector at Merritt. This is a new appointment. Mr. McLean is a returned soldier. He conducted a mining school at Ladysmith, B.C., before going to the front and on his return managed for a few months one of the mines of the Nicola-Princeton coal field. Messrs. Henry Miard of Fernie and James Dixon, late Manager of the Reserve Mine, Nanaimo, who recently was appointed to the British Columbia Board of Examiners, have been appointed also acting inspectors.

Ottawa, Ont.

As a result of the investigation held by the select committee of the Senate of Canada appointed recently to inquire into the question of certain valuable coal leases in the Smokey River district of the Alberta Peace River, about two hundred miles north of Edmonton, the leases have been cancelled by Order of Hon. Arthur Meighen, Minister of the Interior. As a consequence the application for the right to build a railway to be known as the Athabasca Grande Prairie and Vermillion Railway, will go no farther in its present stage. In the investigations that took place officials of the Geological Survey Branch, Ottawa, testified that the coal area in question probably is the richest in Canada and that if developed and connected with the main line to the south it would be able to supply the whole of the West with a coal almost equal in quality to the Pennsylvania anthracite. That this may come about it is recommended that the Government develop the area either on a National or royalty basis and that a line of railways sixty miles in length be constructed at once from the Grand Trunk Pacific or Canadian National Railways' main line to the area in question. The leases comprise some eighteen thousand acres, and the coal available is estimated at from 200,000,000 to 400,000,000 tons. A German-American, Dr. Botts, first filed on the leases in 1912, and paid into the Treasury the sum of $100,000 in six years for his leases. In 1918 he failed to make payment and the rights were cancelled.

Nanaimo, B.C.

On his return from Ottawa recently, Senator Planta made some statements with reference to the efforts which had been made at the Capital to have the duty on fuel oil into Canada removed. He said that strong pressure had been brought to bear on the Government to this end. Petitions having been forwarded with the support of the Vancouver Board of Trade and other Vancouver organizations. The reason advanced for the move being to force down the price of coal. Senator Planta thought that it was the big interests who were behind the movement and he referred in this connection to the C.P.R., the Canadian Pacific Steamship Company and the Manufacturers Association. The Minister of Finance it is stated, had been strongly impressed with the advisability of taking this action but it was so strongly opposed by representatives of the coal mining constituencies that no action was taken.

The Vancouver Island Mine Safety Association will hold its annual contest in first aid and mine rescue work on September 1st next at Nanaimo, B.C. Seven or eight teams are entered representing the various mines of the Nanaimo district and there will be teams from coal producing sections of the mainland as far east as the Crows Nest Pass. The Provincial Government has made a substantial grant this year to assist the Association in providing an attractive programme and interest is high among those who will compete. They have been in training for months and it is expected that the meet will be the most successful held in the Province for four or five years.

Vancouver, B.C.

Two problems are receiving attention at the hands of consumers of coal in the Northwest at the present time. One of these is the likelihood of there being a shortage next winter and the other the rapidly advancing prices.

Coal merchants of Victoria and Vancouver, B. C. state that they do not expect a condition that will prevent their meeting all demands both from domestic and commercial sources. They are looking forward, however, to the arrival of the American naval squad-

ron at Bremerton, Washington, to tax the production of coal in the Northwest to the utmost. In the meantime an advertising campaign is in progress having in view the inducement of the public to purchase their winter supply of fuel as far as possible without delay.

As to prices, there is a considerable section asking for an investigation. Coal now is bringing about $10.75 a ton as compared to $7.50 when the war broke out. Many cannot see the justification for this substantial increase and would like the matter thoroughly probed by a properly constituted government board.

Canadian Consolidated Mining and Smelting Co. Trail, B. C.

In a circular issued by management of the Canadian Consolidated Mining and Smelting Company recently, an advance of wages to employees is announced. A full statement follows: "The management have been giving serious consideration to the further advance in the cost of living, especially married men with families. In Rossland and other camps where the scale of wages increases automatically with advances in the market price of copper, the situation is taking care of itself. In the lead-zinc camps the smelter wage scales have gone up somewhat through increases in metal prices, but as these increases do not compare with the advances in copper, the situation calls for some action.

Effective for three month beginning August 1st, all employees in the lead-zinc camps and at the smelter will receive an additional bonus of twenty-five cents per shift. Existing wage agreements and sliding scales based on various prices of metals will not be affected by this bonus but will continue to be maintained.

Some of these agreements provide that there is to be no advance in boarding house rates while the wage scales set by these agreements are in effect.

In as much as the bonus now granted is in addition to these wage scales and as the advance costs of food, etc., has resulted in heavy losses in the Company's boarding houses, there will be after August 1st, an increase in board of 20 cents per day.

The operations of the Company do not justify the payment of this bonus as there is practically no production of copper and the market prices of lead and zinc are but little higher than before the war.

Employees are asked therefore to co-operate with the management by increasing efficiency, reducing waste and generally taking a personal interest in our mutual welfare."

JAMES J. WARREN,
Managing Director.

The Consolidated Mining and Smelting Company has determined to experiment in the cultivation of land adjacent to its plant at Trail, B.C. Various tracts of land in different directions from the smelter are to be put under crop. The production will be useful in the feeding of the Company's employees and besides the results will be a practical test of the claim made that the smoke from the smelter seriously damages the crops of the district. This is a complaint made by the farmers of the district who have been asking for damages from the Company from time to time. The Company while not denying that perhaps the smoke affects vegetable growth, maintains that the damage done by the smoke is not in any way as serious as alleged by the agriculturalists.

The erection of a large reduction plant at Rossland, B. C. is proposed by the Consolidated Mining and Smelting Company of Canada. The site of the proposed plant has not yet been definitely selected the Company having made a proposition to the municipal authorities of Rossland which is under consideration. If Rossland will guarantee a sufficient water supply and will protect the Company from damage suits it is likely that the installation will take place there, but should this matter not be satisfactorily arranged the John Hintz ranch purchased by the company last year is likely to be selected as the site.

Ore receipts in gross tons for the week from July 22nd to July 31st 1919, inclusive, at the Consolidated Company's Smelter, Trail, totalled 9,684 tons, making a grand total for the year thus far of 202,520 tons. The biggest shippers of course are the Company's mines, 86,755 tons of zinc ore having come from the Sullivan Mine.

A much better outlook for the disposal of the lead surplus of the Consolidated Mining and Smelting Company is indicated by the last circulars of lead shippers issued by the Company. This states that three times the quantity of lead was disposed of in June as during the preceding month.

Anyox B. C.

The Granby Consolidated Mining, Smelting and Power Company gave notice of a further increase in wages amounting to twenty-five cents per day to more than 1500 of its employees a few ways ago. This is the second advance made during the month of July. The Company's action is in line with its agreement with the employees that wages shall be based on the price of copper. If, as is predicted, copper reaches approximately twenty-six cents within the next few weeks, wages at the Granby Smelter will reach a figure almost equal to that paid when the armistice was signed.

Work at the mine and smelter is continuing in three eight-hour shifts and the camp is beginning to take on the appearance of pre-war days. When the armistice was signed there were more than sixteen million pounds of copper at the Granby properties ready for shipment, much of which was disposed of at considerably lower figures than present day prices. Steady shipments have been made recently amounting to several millions of pounds and there still are large shipments piled up on the Anyox docks that will be sent to the refineries as quickly as transportation facilities can be obtained.

The Granby Company has taken an option on the Harrison property on Chickamin Mountain between Eutsuk and White Sail Lakes.

NORTHERN ONTARIO.

Boston Creek District.

Miller-Independence.

Arrangements to proceed with the installation of a new mining plant and mill are well under way. A small steam driven outfit is being rushed to the property with the object of getting mining operations under

Miller-Independence Power House.

way before the end of this month, so as to lose no time during the installation of a larger modern electrically driven plant.

Plans for the erection of the first unit of the new reduction plant that will treat ore at the rate of 100 tons daily have been carefully laid, and, it is estimated, this amount will be going through by the end of the current year. Later on, according as tonnage should demand, the capacity of the plant can be increased.

One of the Miller-Independence Shafts, Boston Creek.

Mondeau Property.

Cross-cutting is being done at a depth of 140 feet on the Mondeau property, near the boundary between the townships of Boston and McElroy, in the Boston Creek district. A vein has been cut a short distance south from the shaft in which considerable mineralization occurs. To the north the cross-cut at the time of writing is in a highly mineralized body, portions of which contain high gold values, some of the assays running as high as $92 to the ton.

The exploration and development of the Mondeau will be continued with the present steam plant for the summer, and the results of the work will determine whether or not a larger plant will be installed during the coming winter.

Diamond Drill on Cullen-Renaud, Boston Creek.

A large cash payment is due on the O'Donald property at Boston Creek, and which is under option to the Allied Gold Mines. Whether or not the payment was made has not been learned at the time of writing. The O'Donald is considered to be one of the most important of the undeveloped mining properties in the Boston Creek district. Diamond drilling carried on during recent months has indicated the presence of commercial ore at depth. The property is under option at a price well up in six figures and it is understood the Allied Gold Mines have endeavored to have the terms modified.

The Cobalt Strike

(Reviewed by our Correspondent.)

The weight of the first real labor strike in Cobalt's history is falling with full force upon the mine workers of this camp. Pay-day arrived and past and was unaccompanied with the usual pay envelop. Not a few of the merchants have found it necessary to offer no further credit. For the first time in their lives a great many of the dependents of the mine workers have come to realize that strikes and stress keep company. Perhaps the greatest pity of all is the fact that those least able to stand the strain are compelled to bear the brunt, and further, the more loyal the subject, the greater is the burden.

A good many returned men, those who worked for $1.10 a day, (hours according to necessity and limited only to twenty-four) have openly stated that the eight-hour day and the high wages paid in the mines were very satisfactory. If the executive of the Cobalt Miners' Union had played a part in fighting for freedom which they now enjoy, declare some of the returned men, they would probably be less anxious to plunge headlong into industrial war at this time and against an industry that is already paying maximum wages and when the principle of of "recognition" is the only important question involved. The man who remained in Canada during the war, working at high wages, was able to accumulate a financial reserve. The man whe went overseas generally finds himself without any reserve fund. The former, the larger percentage of whom are foreigners, and a good many of whom are of alien enemy origin, are able to live in comfort for a time or shift to other parts of the country in search of employment. Not so with the returned men, however, who had just got nicely started to share the advantages of the high wages received since returning to civilian life.

It is a grim fact, that although the majority of the returned men of Cobalt appear to be opposed to a labor strike under present condition, yet they have been compelled to suffer defeat in a voting contest where the ballot of the Hun and the Austrian carried equal weight to their own.

The mine managers of the mines of Cobalt have always exhibited a keen desire to discuss various contentious matters with committees representative of their employes. The returned men are aware of this. They also know the reason. They know that such a procedure permits every man to voice an opinion. They that not only is the Western Federation of Miners the traditional enemy of every honorable mine manager, and that by dealing with that organization they would only hear the voice of the radical element whose every action would be in constant danger of being influenced by doctrine of a few non-working "leaders". And so, unless the executive within a reasonably short time find a pretext for at least partially rectifying the blunders of the past month, they appear to be confronted with the probability of being asked to surrender their present authority, or face collapse of the labor organization in its present form.

Summarized, the situation in Cobalt is this: Early in the current year there was little or no dissatisfaction, but signs of an unrest began to appear. In June this unrest had grown to such a pitch that a

strike vote was taken and resulted in a large majority in support of presenting demands which included recognition of the union. At no time did there appear any glaring dissatisfaction. On July 13th a meeting was held in the Union hall and the radicals were defeated at every turn. On July 14th, the writer was informed by a prominent labor man that a meeting to be held on July 20th would probably result in all action being deferred for this year at least. It is a significant fact that the meeting on July 13th was held in the absence of Jimmy McGuire who was in Ottawa keeping in touch with Senator Robertson, Minister of Labor. Before the end of the week the whole situation took an unfavorable turn. It became known that Senator Robertson had requested that the Mine Managers Association send representatives to Ottawa for a conference, that the Union were aware of this, that the Union Executive had previously written the mine managers urging them to attend and that Senator Robertson, on the refusal of the mine managers' to attend such a conference in connection with an issue that was dead, told McGuire that the Government could do no more and that the stand of the union was justified. Had Senator Robertson not invited the mine managers to a conference which he surely felt convinced that they would not desire to attend, things might have gone differently in Cobalt. As it was, McGuire returned from Ottawa, attended the meeting of July 20th, told the 500 or 600 men gathered there that the mine managers had defied constituted authority by not going to Ottawa, that the Minister of Labor had declared that the stand of the Union was justified, that the mine managers were to blame and that a strike was all that was necessary to win that which the Union was demanding. He asked all those in favor of a declaration of a strike to take effect July 23rd. to rise. The vote was almost unanimous. Thus, on the very day which prominent and cool-thinking labor men had the week before expected would result in deferring action for another year, actually saw the industrial situation in Cobalt completely upset.

The Minister of Labor has denied charges that he told McGuire to call a strike. The Minister, however, has not denied that he failed to use his influence to prevent the union from calling a strike. He actually stated that the government had done all that it could be arranged for a settlement and that the stand of the union was justified. At that moment the present strike became inevitable.

During the absence of McGuire and the absence of suggestions from Senator Robertson, the agitation among the mine workers became a dead issue. With the presence of McGuire and the suggestions of Senator Robertson it was fanned afresh into a flame that is still burning.

That the Minister of Labor did encourage the Miners' Union in its stand and did not ask the Union to defer action is borne out in the following copy of a telegram sent to the Minister by the secretary of the union, which reads as follows:— "Reports in "press that we stated you had told us to go on strike "are false and we are preparing statement for the "press giving the developments throughout the "progress of the dispute. The only statement was "that you said you did not see that the department "could do much more, and that you would not ask "them to wait longer in view of the managers' at- "titude."

The following reply was sent by Senator Robertson to the Union secretary:

"Your telegram received and the statements contained therein are exactly in accordance with the facts."

Men who are neutral on the issue involved, and who are desirous of seeing labor receive just treatment are found expressing wonder at the stand taken by the Labor Minister, which is apparently to support the Western Federation of Miners even to the point of a strike.

The Cobalt branch of the G.W.V.A. recently appointed a committee whose duty it was to endeavor to bring the contending factions together. The views of the mine managers, according to this committee, are set forth as follows:—

"The Mine Managers will not recognize this Union. It is a branch of the International Mine, Mill and Smelter Workers, formerly known as the Western Federation of Miners. This Western Federation of Miners has a history of intimidation and terrorism. The managers have reams of correspondence, judicial and Royal Commission reports and other data to prove this. The local leaders are radicals, and, the managers believe, do not represent the main body of workers. By their ability to talk they got their radical views before the members, which appeals to the floaters, foreigners and discontents. The managers are all willing and anxious at all times to treat with their workers through individual committees elected by workmen in each mine, and this has proved successful. Union members are not discriminated against, and there is no objection to the men joining the Union, but the managers will protect their non-union workers. Conditions in Cobalt are of the best.

"The managers knew last fall that this trouble was coming, and even then all was well until the arrival of the Industrial Relations Commission resulting in a lot of radical propaganda in the Press. The Union served them with a 48-hour ultimatum and the Minister of Labour has tried to force recognition of the Union down their throats. He himself has said that the real dispute is the recognition of the Union. The managers accept his diagnosis. They will not recognize the Union, and therefore there is nothing whatever to negotiate. The Minister of Labour suggested that the managers go to Ottawa. They replied that they would not waste the time of the Prime Minister and himself by going to Ottawa when there is nothing they can concede, and when the correspondence sets forth their case so exhaustively. They have never been offered a Royal Commission, and have no power to accept or to refuse one. The Minister of Labor has tried to make them swallow the Union, and because they will not do so, he is trying to blame them for the strike. Again quoting their letter: "The present dispute is one between the Mines and the Western Federation of Miners, and in no case can it be considered as one between the mines and their employees.

The mines did not throw their men out of employment but the union did and since the mines will not deal with or through the Western Federation of Miners, the question of adjusting the present deadlock is one that must be seettled by the employees themselves. At present the majority of the mines are prepared to re-open under the old conditions as regards hours of work, base wage and profit sharing bonus, but as to how long that condition will prevail we are unable to advise."

The G. W. V. A. Committee concludes its reports as follows—

"Now, comrades, you have heard what both sides have to say, and you must bear in mind that we are not vouching for the accuracy of any of the statements. The indisputable fact is that both sides are absolutely at a deadlock. In fact we have felt that the Mine Managers, though they were very courteous and ready to give us information, were treating us with a certain amount of amused tolerance. They knew we were bound to fail as negatiators, for they will not negotiate. We have tried to be fair and impartial in this investigation, and give you an absolutely unblased view of the facts. There is one thing that you may be assured of and that is that we

have not leaned to the employers' side as we have been accused of being tools of the other parties.

"There are a few other points to which we would draw your attention.

(1) The operators will not conciliate. The Union has shown a very marked tendency to conciliate. This you may construe as evidence of strength or evidence of weakness.

(2) The operators refuse to go into print. The Union has gone into print. This also you may construe as evidence of strength or evidence of weakness.

(3) The operators claim that the Union officials do not represent the main body of workers. The Union officials claim that they do.

(4) The operators will bait no hook to entice the men back to work. Anything they may contemplate doing, if they do contemplate attempting improved conditions for the men, will not be considered unless or until the men return to work.

(5) The operators says that they have and always will give the returned men the preference over the alien enemy; that if an alien has a job that a return man can fill, the alien enemy goes. (This of course is not a bone of contention with the Union.)

"This comrades, is our report. We are sorry that we cannot settle the strike. We have failed as others have failed. The trouble is that when we beat the Boche, we did not distroy distrust, bitterness and rancour. At the same time we sincerely hope that the information we have gathered together and submitted to you will not be altogether unproductive of results."

Developments may now rapidly occur, and attention is directed on four considerations.

First, is the proposal of the G. W. V. A. to proceed with the organization of a local union under an Ontario charter unconnected with the Western Federation of Miners, or the Mine, Mill and Smelter Workers Union. The executive selected are all mine workers,. Second, the attitude of the mine managers toward the scheme is being awaited with extremely keen interest, the general impression being that the plan will meet with their approval. Third, is speculation as to what counter measures the radical executive of the Western Federation faction may adopt to combat the move that threatens the existence of the W. F. M. in this its last stronghold. Fourth, is how the great body of mine workers will view the matter.

The present executive of the Cobalt Miners' Union was elected last Winter, its plaform being to cling to the International. The opposition, made up of the moderates, were defeated on it platform of breaking away from the International and forming a local union. There would now appear to be great probability of the moderates joining forces with the G. W. V., in which case the Western Federation which is being kept alive by "Jimmy" McGuire would fall.

Provided the mine managers will lend their support to the plan of the G. W. V., there is a likelihood of the strike being broken in a short time, facilities provided for collective bargaining with the moderate element representative of all workmen in the camp, and consequent reasonably harmony as a result of open discussion.

As a result of the present favorable developments, and the probability of further rapid action, a spirit of genuine optimism is again abroad in Cobalt and there is a feeling that the radicals have failed to make good their boast that they could put the country on the "bum".

Latest advices are that members of the Union have been forbidden to vote in the referendum which has been arranged by the G. W. V. A. Committee, on penalty of expulsion from the Union.

A secret ballot has been arranged, Major J. D. MacKay and Major J. E. McCuaig, ex-Mayor of Haileybury, being the returning officers. All men on the July payroll of the companies are eligible to vote. August 19th is polling day.

The vote is to be taken on whether the men shall return to work immediately on the terms negotiated by the Soldiers' Committee with the Mine Managers Association, which provide for the old conditions, consideration of the cost of living problem, the appointment of local committees elected by the men for each mine, and the election of a central council to deal with the Managers Committee, no discrimination, and the granting of a day's holiday during the week to men compelled to work on Sunday.

Some Recent Improvements In Steam Hoisting Engines

By F. A. McLEAN.

To meet the demand for small and medium sized hoisting engines for mining and industrial purposes the Canadian Ingersoll-Rand Company, Limited, Montreal, Quebec, has just placed on the market a line of such engines of rugged construction, in several sizes, in which are embodied many improvements which have been adopted as a result of their long experience in the manufacture of mining machinery, and knowledge of the unfavorable conditions under which mine hoisting machinery is sometimes forced to operate.

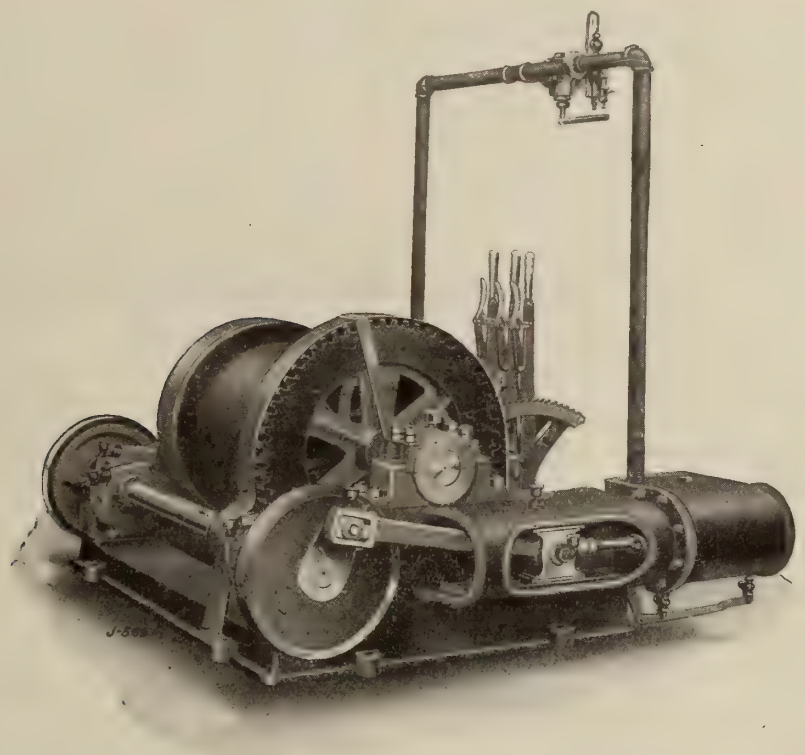
Before going into the manufacture of these hoists its was decided to produce them in quanutities on the interchangeable part system, using jigs and fixtures and finishing all parts to close limits, the value of which had been thoroughly demonstrated by their experience in the production of shells and ship winches in large quantities during the war, as well as in the manufacture of their rock drills and pneumatic tools. At present the company is building these hoists in five sizes ranging from 8 x 8 to 10 x 12 inches with conservatively estimated lifting capacities of from 4,000 to 10,000 pounds and will build them in larger sizes on special order.

Some points of particular interest in the construction of the new "CIRCO" hoists are as follows: Cylinders are cast separately from the side frames and being identical in construction are interchangeable, permitting one spare cylinder to be used on either side of the hoist and eliminating the necessity of scrapping the side frame should one of the cylinders be accidentally damaged.

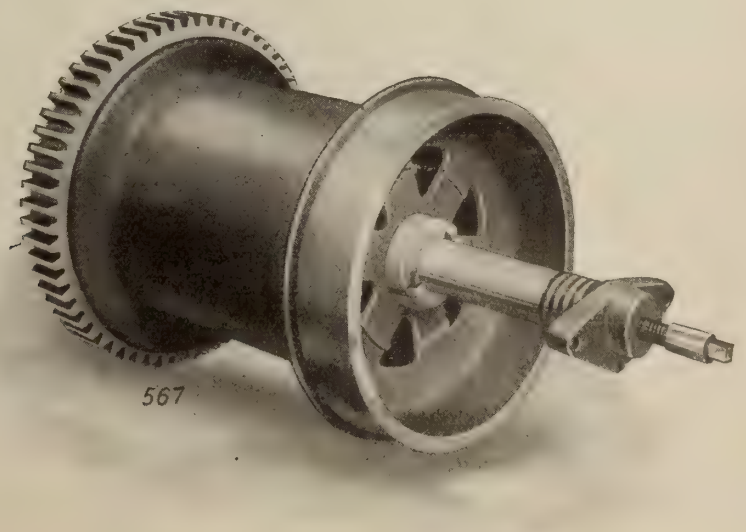
The valve chest is provided with two openings allowing the exhaust pipe to be connected to either the top or bottom of the valve chest as may be most convenient. the opening which is not in use being closed by a plug In case it should ever be found necessary to operate the hoists by compressed air this extra opening will be found of considerable value as it will enable the air to exhaust to the atmosphere much more freely than is possible with the older styles of valve chest. The cylinders are bolted to the side frames by strong lathe turned studs and faced nuts and the walls are so proportioned as to permit the operation of the hoists at maximum pressure after reboring. The steam ports are made as short and direct as possible and are of large areas. Exhaust passages are so designed as to reduce back pressure to a minimum.

The ease with which the cylinders may be changed is characteristic of the entire machine, all parts being made to close limits and of the best materials obtainable, thoroughly inspected throughout the successive steps of manufacture. The ease with which these hoists may be taken down should make them of special value for use in isolated mines where the machinery has to be taken apart and transported long distances by horses or mules. The valves used are of the plain slide type fitted with an adjusting device which compensates automatically for wear without changing the original alignment of the valve rods. The valve guide blocks are of finished cast iron accurately fitted to babbitted guides cast on the side frames.

Eccentrics of the locomotive type are used having deep flat rods bolted to the eccentric straps by lathe turned bolts in holes reamed after the valves have been set, thus preserving the accuracy of the original setting. The eccentrics have large bearing surfaces and are adjustable for wear at the pins. Connecting rods are of steel of the solid end type with bronze boxes in both crank and crosshead ends which are adjustable for wear by means of screws and wedges. The screws are adjustable in opposite directions so as to insure approximately the same length in each rod. The crank pins and crankshaft are made of the highest grade of open hearth hammered steel fitted to cranks of the counter-balanced disc type by hydraulic pres



View from Right Hand Crank End, Single Drum 7x10″ Hoist



Drum, Drumshaft and Friction Device

sure. The crank discs are finished all over and to insure accuracy they are turned and the holes for the crank pins bored after the discs have been pressed on the crank shaft.

The usual practice of casting the drum shaft bearings integral with the side frames has been departed from by casting them separately and bolting them to the frames. A high grade of babbit is used in these bearings, which are adjustable for any wear which may occur. The drum is made from a tough, close grained, grey iron casting, turned, bored, and tested for balance, and a good running fit on its shaft. The drum bearings being bolted to the frames, permit accurate alignment of the drum and engine shafts, and ensure easy running gears. A heavy brake ring is cast on one end of the drum and on the other is a friction of the heavy "V" type, which has demonstrated its efficiency for this class of service. The brakes are proportioned so as to have a holding capacity considerably in excess of the maximum load which the hoist is capable of lifting; a feature which should be of value in emergencies, or should the hoist be accidentally or intentionally overloaded. The drum driving gear and shrouded pinion are made from semi-steel, a material which has been found well suited for this purpose. The pinion is fastened to the crank shaft by a large key allowing it to be easily removed when necessary.

When reversible engines are desired the hoists are fitted with a Stephenson reverse gear, operated by a hand lever with quadrant and locking latch which is placed near the clutch and brake levers in a bank at the operator's stand within convenient reach of the throttle facilitating the easy operation of the hoist.

The Canadian Ingersoll-Rand Company, also build two styles of hoists of smaller capacities than their new "CIRCO" hoists, known as the "Little Tugger," and the Special. The former is of the Dake or square piston type, and the latter is of the diagonal reciprocating type with trunk pistons. Either of these hoists may be arranged for operation on steam or compressed air. Being of simple rugged construction, and requiring no special foundation, they may be readily moved from place to place, are easily handled by unskilled labor, and are particularly adapted to light hoisting and hauling jobs in winzes raises and prospect shafts, such as handling drills, mountings, steels, timber, muck, or for hauling small ore cars up a grade, and similar classes of work within range of their capacity, which in the case of the Special is 1,400 pounds and 1,000 pounds in the "Little Tugger."

INSTITUTION OF MINING AND METALLURGY OPPOSED TO NATIONALIZATION OF COAL MINES.

The following resolutions were adopted by the council of the Institution of Mining and Metallurgy at a meeting specially convened for the purpose held on the 23rd ult.:—"That the council of the Institution of Mining and Metallurgy, as representing the technical interests of important national industries consuming large quantities of coal, view with grave concern the serious diminution in production and increase in the cost of British coal, which have developed since the present trend of Government intervention became operative." "That the council consider that the published evidence given before the Coal Industry Commission has failed to establish either the necessity for, or the expediency of, the nationalization of the coal mining industry." "That the council are strongly opposed to the State ownedship of the coal mining industry, as they are of the opinion that there is no evidence to support the assumption that nationalization would result in an increased output or in a reduction of labor stoppages." "That the council are prepared to acquiesce in the recommendation embodied in the Report of the Chairman of the Commission for the acquisition by the State of coal royalties, with the proviso that "fair and just compensation to the owners' be paid." "That a copy of the foregoing resolutions be sent to the Prime Minister."

MANITOBA

The Pas, Aug., 6.—Mr. J. P. Gordon returned from his claims north of Copper Lake bringing with him samples of quartz. These consist of lumps of quartz, some of them weighing many pounds, matted by string and leaf gold that form fully 50 per cent. of the mass. The gold is as massive in the quartz as the silver in calcite at Cobalt. The vein is said to be six feet wide and parallels the big dike.

The original discovery was made by an Indian prospector, Jacob Cook, some time ago, and it was while investigating this that Mr. J. P. Gordon made a further and richer discovery.

Other prospectors took up the hunt, and now the vein has been traced for 6,000 feet, the samples shown being taken from a depth of three feet.

A considerable number of claims have been staked in the locality, the best known being the Peterson group which lie a little to the north of the Gordon discovery.

The new discovery is only some 70 miles from The Pas as the crow flies, but owing to lack of transportation facilities prospectors are compelled to travel nearly twice that distance by following the waterways to reach the gold fields.

John W. Callinan, of the Flin-Flon properties headed for the new find yesterday in his own motor boat. He thinks the discovery is a big thing.

Messrs. Hassett, Owens and quite a number of others interested in mining matters, left for the Gordon-Peterson claims, north of Copper Lake on Tuesday night's Ross boat.—From the "Herald."

BEATRICE MINE, CAMBORNE, B.C., TO RE-OPEN.

The "Journal" is officially informed that R. R. Christie, of the New Era Mining Company, bondholder for the Beatrice Mine, has left for Camborne with a crew of men to re-open this well-known silver mine, and that it is the intention of the company to keep a fair-sized crew on the ground all winter.

Hazelton, B. C.

The Rocher de Boule Mine has been closed down and it is doubtful whether development will be continued this season.

Nelson, B. C.

After a period of idleness of some years the McAllister mine on the north fork of Carpenter Creek, near Three Forks, is resuming operations. It has been taken over by the Slocan Silver Mines, Limited, F. W. McDonell being foreman. This is a well-known property. It has been developed on three levels, and has a dry silver ore.

AMERICAN INSTITUTE OF MINING AND METALLURGICAL ENGINEERS.

Mr. Charles Schwab will be a speaker at the banquet of the American Institute of Mining & Metallurgical Engineers to be held in Chicago September 22nd to 26th, inclusive. Elaborate plans for both the technical and social side of the meeting have been perfected. Engineers who take the trip to Chicago for this meeting are assured of one of the most interesting annual meetings which the Institute has held. In addition to some hundred and fifty papers which have been prepared for the meeting, trips to the zinc smelting districts, the steel works at Gary and the refineries at Whiting and East Chicago are included. A boat trip on the lake together with numerous social events have been arranged for the ladies. The Fifth Annual Exposition of the Chemical Industries will be held in Chicago at the same time as the meeting of the American Institute of Mining & Metallurgical Engineers and members of the Institute are cordially invited to attend the exposition and become better acquainted with the allied industries.

MINING MACHINERY FOR SALE.

COMPLETE AIR COMPRESSOR PLANT.—1053 cubic foot Canadian Ingersoll-Rand Compressor in perfect condition. 175 H.P. Motor on 2200 volt, 3 phase, 30 cycle current; Driving Belt, 2 air receivers, piping, valves and fittings.
Also 2 Cable Derrick Outfits, a 20 and two 12 H.P. boilers, 3 hoists, small steam engine rails, mine cars, pipe and various equipment.

Almost Unbelievable Power-Saving and Economy

Time and again we have found purchasers of Goodyear Extra Power Belting openly skeptical that it would live up to our promises.

Time and again they have told us not only of lower belting costs, but also of increased and faster production, time and power saved.

Today there is no reason for any plant to buy belting on promises.

On file in our office are letters which enable you to buy belting by proof.

Records of Goodyear Belting performance.

Records of extreme long-life which means economy.

Records of pulley-gripping, non-slip qualities which save power.

Records of work under strenuous conditions of heat, cold, damp, acids.

Records of strength and flexibility.

Records which prove that without Goodyear Extra Power Belting enough power is wasted in Canada every year by poor belts to pay a big dividend on Industry's capital.

Some of this power is being wasted in your plant. Better belting, scientifically applied, will save you money. Without obligation to you, a belting man, trained by Goodyear, will call and make a record of your needs and experiences. Our recommendation will come from engineers who fit belts to conditions. Phone, wire or write the nearest branch.

EXTRA POWER BELTING

EDITORIAL

COBALT STRIKE—STATEMENT OF THE MINE MANAGERS.

At the request of the President of the Temiskaming Mine Managers' Association we are pleased to publish in this issue a statement outlining the position of the Association in reply to the statement of the Minister of Labour published in the "Journal" of August 13th.

THE WIDER OUTLOOK OF THE U.S. COAL TRADE.

A significant innovation in our United States contemporary "Coal Age" is a page devoted to "Foreign Markets and Export News" which contains news relating to the coal requirements of such widely scattered countries as Switzerland, South Africa, New South Wales, South China and Russia. This is one of the many indications that our United States friends have apprehended the opportunity for export coal business that now presents itself through the paralysis, and in some instances the "hari-kari" of the European coal-trade.

In Canada, unfortunately, it will not be time for us to talk about exporting coal until we can supply our own requirements, or more correctly put, until we do supply our own requirements. That we *can* do this is not a matter for debate.

For comparison, one may note that South Africa has increased its coal production from 8,801,000 tons in 1913 to 10,383,000 tons in 1917, and that Japan's coal production has increased from 21,083,000 tons in 1913 to 27,500,000 tons in 1918, and it may be further remarked that Japanese coal is produced under conditions of great physical difficulty.

Compare the area of Japan and its coal resources with the area of Canada and our much larger coal resources, and it is hard to excuse a coal production in Canada of around 14,000,000 tons, particularly when Canada uses 35,000,000 tons annually.

THE FIVE-DAY WEEK FOR COAL-MINERS.

Old-fashioned folk, who in the erring and thoughtless days of their adolescence and later youth, absorbed the teachings of Poor Richard's Almanack, of Smile's "Self-Help," Emerson's "Essay on Self Reliance," Todd's "Self-Culture," Solomon's Proverbs—yes, and the Ten Commandments also, and later on, when contact with men and things brought disillusion, consoled themselves with the mild sceptism of Ecclesiasticus and Omar, do not quite know what to make of this present-day world, when work is regarded as a thing abhorred, and unoccupied leisure appears to be the desired haven of all mankind. Unoccupied leisure for a selected number that is.

The worker who desires a free Saturday and Sunday, for example, has no compunction in working the tram employees and restaurant hands seven days a week and all holidays. His idea of rest is making someone else work.

The old-fashioned idea that production could only be obtained by hard work seems to have suffered eclipse, but there must be some truth in the ancient superstition, because Lloyd George has recently stated that the reduction of hours of labour in Britain has reduced the production almost in the same mathematical proportion. The Premier, who knows as much about work as any man, did not attempt to explain how the same revenue could be produced by a decreased output, in fact he was unkind enough to say it could not be done. He said: "We shall never improve matters until we increase production, or we shall be driven later to reduce even lower the standard of living in Britain. There is no other alternative except quitting the country for which we fought for four years."

One is surprised that Mr. Lloyd George should so revamp the primeval curse, and intimate that man has to earn his labour by the sweat of his brow. The phrase is not even polite English in these days, and yet it is a most accurate description of one of the eternal verities.

The feature that saves us from the worst that can be done by the cloud-capped amateur reformers who would smash the present scheme of things and re-fashion it nearer their heart's desire, is that many mooted changes ignore the domestic relations of men as much as they ignore the immutable principles of economics. Labour leaders forget that idleness in itself is a distressing state to all normal men, and they also forget that man is a monagamous being, and that in civilized countries marriage is a partnership involving a fair apportionment of human labour.

It may be permitted, without impertinence or any desire to interfere with private affairs, what the miner's womenkind wil say to a five-day week, with, of course, the inevitable five days' earnings that will accompany such an arrangement. By no method known to man can five days' work produce as much coal as six days' work.

As the initiated know, Saturday morning, in ordinary households, is the time when men are not desired around the house, unless they desire to help in the domestic work. How will a healthy man occupy himself on Saturday morning? In the summer he can find occupation pleasant enough, but in Cape Breton the summer is all too brief.

There are no reading rooms, nor social clubs at any of the Nova Scotia collieries. There are not even the social facilities afforded by saloons, for theoretically the sale of intoxicating liquor is forbidden in Nova Scotia. At collieries it is twice forbidden, first by the Coal Mines Regulation Act, and secondly by all the penalties of the Nova Scotia Temperance Act, but, as everyone knows, liquor is sold in large quantities, with all the dire results that follow "blind pigs" and illegal dives, and the kind of prohibition that does not prohibit.

Those who preach "up-lift" and ethics that ignore the habits of the average adult, will say that there are many useful ways in which men can employ their leisure, and so there are, but it will not work that way.

The miner's leisure—if he takes all Saturday off—is likely to prove a greater problem to himself than it is to others, for miners are not given to mere loafing. Very few men can loaf—and be happy. And no good can come of a scheme that will make additional work for others, and will at the same time reduce the miner's output, his earnings, and, as seems likely, his domestic peace.

SICKNESS RELIEF SOCIETIES.

The announcement that the mining companies in the Porcupine District contemplate forming a society for the relief of loss of earnings among the mine-workers arising from sickness and non-occupational disability, shows a proper appreciation on the part of the mine managers of the real necessities of their employees.

The Workmen's Compensation Act provides relief in cases of accident arising out of employment risks, but statistics show that the amount of lost earning power caused by non-occupational disability is only half that caused by occupational accident. While the miner lives a healthy life, as vital statistics prove quite conclusively, there are certain diseases to which he is unusually exposed, and in no occupation is there so indeterminate a line of demarcation between occupational and non-occupational disability. This "shadow-line," as it is is called by those who have specialised in insurance and accident statistics, affords much scope for malingering, as it also, in many cases, has worked undoubted hardships to men whose disability was obscure in origin or in symptoms.

The miner needs insurance against sickness just twice as badly as he needs insurance against accident, and no better way has yet been devised than that of the mutual benefit association such as is proposed at Porcupine.

The knowledge that some income will be forthcoming in the event of sickness often prevents sickness by lessening mental anxiety, and it certainly lessens the number of compensation claims. The mine owners themselves benefit largely by the institution of a mutual benefit association, as where the mine-owner is at once paymaster, landlord and general provider for an isolated mining-camp, he must of necessity help his workmen when they are disabled by sickness, even were he not possessed of the ordinary compassion of average men. All mine managers know what long sickness of workmen occasions in the matter of private benevolence, but they do not talk about it.

No proposal that has been made in the North Country promises so much in the way of real co-operation between employer and employee, or will tend to such comfortable relations as the inauguration of a really adequate and permanent system of sickness relief in the mining camps. It is essential, however, to the success of the proposal that the miners should themselves contribute the greater part of the fund required out of their own pockets, and that they should accept the full share of responsibility of management and supervision of the undertaking that their proportionate contribution requires.

THE FUTURE OF THE BRITISH COLLIERIES.

Premier Lloyd George has announced that the Cabinet has rejected the recommendation of the Sankey Report for the nationalization of the coal industry, but has accepted the principle of acquisition of the mineral rights by the State, and a measure of public control over the coal trade, but not so extended as to kill the healthful stimulus of private enterprise. The Government's policy, therefore, follows very closely the recommendations made by Sir Arthur Duckham, Director of Aircraft Production, and a Government nominee on the Coal Commission. The text of the Duckham report will be found on page 649 of this issue.

One of the very curious reasons advanced by Justice Sankey in favour of nationalization of the coal mines was that the miners refused to work for the colliery owners, and that he could see no prospect of harmony unless the miners worked for some other body of persons. Like many other persons, with smaller mental capacity than a Chief Justice, he suggested the Government might try its hand at the difficult task of raising wages and at the same time keeping down the price of coal, and of increasing coal output while simultaneously decreasing the hours of labour.

The Yorkshire strike was cited by the Premier as evidence that Government control did not necessarily mean harmony.

By accepting the principle of state ownership of minerals, and taking the responsibility of "supervising and controlling all mineral rights throughout Great Britain, so as to ensure the proper working of all minerals," Mr. Lloyd George has announced that the British Government considers the coal-seams of Britain as forming part of the public domain, with all the implications that such a momentous decision carries with it.

By rejecting the nationalization proposal, the Premier has announced that the British Government does not accede to state control of labour.

From these two things it may be deduced that the

British Government has awakened to the dangers of confusing industrial conditions with politics, and those who wish to see the rights of all the people upheld and preserved, and deny the right of any one class of the population to demand special treatment and extraordinary political privileges irrespective of the remainder of the population, will be encouraged by the clear-cut distinction made by the Premier.

It is fortunate that the demand for unprecedently preferential treatment should have been made by the coal workers, because coal is the basis of Britain's industrial fabric, and there is no man so poor or insignificant in Britain but his pocket has been touched and his comfort threatened by the overweening demands of the miners' leaders. The miners do not seem to have regarded themselvs as being members of the body politic, but as being deserving of peculiar honour and exclusive privilege. The supreme importance of coal in the prosecution of the war, and the all-important asset of coal in national industry is perhaps responsible for this misconception of the miner's political position by himself, and the acceptance of this high valuation by others, but when the President of the Board of Trade anounced recently an increase of six shillings per ton on the selling price of coal, the country saw that it was paying too dearly for special privi lege attaching to one selected class of workers.

The acquisition by the State of the coal seams is to some extent but a rectification of past mistakes. The inheritance of large landed estates from ancestors who lived before the invention of the steam engine made coal a valuable mineral is not a subject for profitable debate. The point of view will depend largely upon one's ancestors. But the Enclosures Act of 1790, which conveyed large tracts of common lands to the lords of the manor greviously erred in that it did not reserve to the Crown the underlying mineral rights. In this respect the State in deciding to acquire the minerals will re-enter into possession of an asset it should never have given away to private owners.

Those who have had practical acquaintance with the management of large coal properties will be interested in Sir Arthur Duckham's recommendations for the amalgamation of all mining properties in specified districts for the purpose of obtaining the best economies and efficiencies in the winning and working of coal. particularly to ensure the most efficient draining and pumping, the most rapid transport of the coal to the surface and the miner to his work; the obtaining and distribution of power from one centre, and the prevention of waste of coal by artificial barriers and interfering leases and way-leaves.

Another recommendation in the Duckham Report which applies especially to coal-mining conditions in Canada, is that "the general extension of multiple shifts, as the most ready means of increasing output, "reducing costs, and improving wages to the workpeo- "ple as a whole should be immediately considered by "a joint Committee of the Government, owners and "miners."

Our readers will recollect that the "Journal" has on a number of occasions made a similar recommendation in order to overcome the decreased output, increased costs and smaller wages which must necessarily accompany the reduced hours of labour recently adopted in Canadian collieries.

U. M. W. DISTRICT NO. 18 RESUMING WORK.

It is reported from Ottawa that sixty per cent of the collieries in the Fernie and Edmonton fields have resumed work. This news, which is a consequence of the repudiation of the O.B.U. movement by the mine-workers, is good news. Few coal fields have been so wantonly hindered in business expansion by continued strikes as District No. 18, and it is to be hoped that a longer period of uninterrupted work than has been usual is now commencing.

PERSONALS.

J. R. McNeill, for the past eight years manager of No. 11 Colliery of the Dominion Coal Company, has resigned his position, and will take the managership of No. 3 Colliery (Florence), of the Nova Scotia Steel & Coal Co.

W. R. MacDonald, manager of No. 6 Colliery of the Dominion Coal Company, has been appointed Safety Inspector. T. Chew, underground manager of Dominion No. 2 Colliery, has been appointed manager of No. 6.

Mr. C. H. Hitchcock is at West Shiningtree.

Mr. Bennett is at the Gosselin property, Shiningtree.

Mr. R. Pearce, editor of the "Northern Miner" has been visiting the mines of the Wasapika gold area.

Mr. H. S. Robinson, formerly superintendent at the Trethewey mine is now at the McIntyre gold mine. He recently returned to Canada after serving in the U. S. army.

Mr. Evered, manager of the Davidson gold mine has returned to Porcupine after visiting the Herrick, Wasapika and West Tree properties in the Wasapika gold area.

Mr. A. H. Brown, mines inspector, recently visited the Wasapika gold area.

Mr. Geo. R. Rogers, president of Wasapika Gold Mines, Ltd., is at the property.

Major H. Whittingham has been demobilized, and has returned to Sardinia as superintendent of the Gennamaru mines. His address is Ingurtosu, Arbus, Sardinia. Some years ago Major Whittingham was on the staff of the Nipissing Mining Company, at Cobalt.

Mr. H. C. Carlisle who was in charge of the operations of the Mandy & Co., in Northern Manitoba, is now with the Tonopah Mining Company at Tonopah, Nevada.

Mr. William J. Hamilton, of the Cerro de Pasco Copper Corporation of Peru, is visiting his home at Westmount, Quebec.

A STATEMENT FROM THE MINE MANAGERS ON THE PRESENT STRIKE CONDITIONS IN COBALT, ONTARIO.

In the words of the Minister of Labour, the present labour dispute in Cobalt has narrowed down to a positive difference of opinion as to whether or not the local branch of the Western Federation of Miners, now known as I.U. of M.M. and S.W. should be recognized. On one side the Union officials and the Minister of Labour insists that it must be recognized, and on the other side the Mine Managements are just as positive in their determination that the Union will not be recognized until at least the laws of Canada are so amended as to make such recognition obligatory.

The criticism heard on the street and apparently emanating from those who may be described as the agitating minority is that the Mine Managers have taken an arrogant stand and have refused to discuss the question of recognition or any other points that may be made an issue with the men themselves. We believe that no mine manager has ever refused to discuss any question with either his men individually or with a committee of his own men elected by his own employees. We believe that in all cases where a request was made to meet and discuss matters, and in fact where the desire was merely indicated, the managers have always willingly and gladly discussed the points thus raised in a friendly and sympathetic spirit. On this basis the charge, namely that the managers have refused to meet their own men, falls of its own weight and the fact that the men of Cobalt did not ask to discuss the questions involved in the present controversy with their managers shows that they were entirely indifferent to the results contingent upon a strike, or that they were prevented from so discussing these questions by the Officials of the Miners' Union.

For the past twelve years there have been strikes threatened by the same organization. Strike votes have been taken and a large majority in favor of strike announced, but for some reason or other the officials in whose hands was placed the authority to take action or not, as they saw best, were not inclined to put the feeling apparently expressed in that strike vote to a test.

At the time the Royal Commission was appointed to investigate and advise on industrial conditions, the membership in the local Union was something less than twenty-five per cent. of the men employed in Cobalt. With the appointment of this commission, a movement was put under way to increase the membership and at the time the Commission visited Cobalt in May of this year, probably fifty per cent. of the employees were paying dues to the Union. In the wake of the Commission as they travelled East across the continent from the Pacific Coast, strikes in many large centres developed, led by men of extreme Socialistic tendencies, culminating in an attempt to establish Soviet rule in the city of Winnipeg. (Later Queen and Dunn, leaders in this same strike at Winnipeg, were invited to Cobalt, met by Union officials and on the night of July 18th were escorted by Union members to the rink, accompanied by a band, thus being honored as no other visitors to the Union had ever been honored before.)

Taking advantage of the general feeling of unrest in industrial localities elsewhere, the agitating minority of the local Union created a manufactured situation in Cobalt and as a result an ultimatum, with a time limit of forty-eight hours, was served upon the Cobalt mines. The Union demanded a largely increased wage, a forty-four hour week with forty-eight hours pay, time and a half for overtime, double time on Sundays and legal holidays, with recognition of the Western Federation of Miners, and the check-off system The latter it might be explained means that the mines would become responsible to the Union for all dues assessed on the men and that no man would be allowed to work on the properties who was not a member of this Union and in good standing, or in other words, the mines would thereafter operate on a closed shop basis.

No response in reply to this ultimatum having been received by the Union, they advised the Minister of Labour that we refused to treat with them and received a reply from the Minister asking in a most peremptory manner that the Union furnish him the names of those Companies that had refused to treat with their men.

This was on the eve of the taking of a strike vote by the men and the Minister's request was conspicuously posted at the polls.

The plain inference in this was that he would force any such companies to treat with the Union irrespective of any laws then existing in Canada, in all of which his attitude was not unlike that of many Union agitators.

A strike vote was then taken and it followed that under such circumstances a large majority for a strike should be officially announced.

The Department of Labour at Ottawa was advised concerning conditions, presumably by the local Union and a representative of that Department, at the request of the Minister of Labour, visited Cobalt and made a careful study of the situation. We have reason to believe that this report confirmed the position taken by the mine managers and believe that had the Minister of Labour taken an entirely neutral position in this controversy, that report would have been published.

At the request of Mr. Quirk, referred to above as representative of the Department of Labour, we confirmed our verbal statements to him in a letter addressed to the Minister of Labour under date of June 7th.

In this letter we pointed out that we were already practising collective bargaining in dealing at all times with groups or committees of our own men, but that we did not concede collective bargaining if such bargaining was of necessity through the Western Federation of Miners. We pointed out that the accusation of discrimination as brought against us by the Union was without foundation, since there was no disposition on the part of any management to refuse an applicant for work because he was a member of the Western Federation or any other Union. We maintained that living conditions in this camp, educational facilities, hospitals and recreation were perhaps better than in any other Canadian mining camp; that through the means of a bonus based on the price of silver, the wages were higher than that of any other camp and that the average wage in the largest mine operating in Cobalt was then $4.35 per shift, which has since been increased by an additional bonus of twenty-five cents, making that average at the time the strike took place $4.60 per shift.

The Minister of Labour was furnished with many decisions from Supreme Courts, Coroners' Juries, Royal Commissions, various Governors, and President Roosevelt, all dealing directly with the Western Federation of Miners and Charles Moyer, its President,

showing conclusively that the history of the Western Federation of Miners is a record of intimidation and in many cases incendiarism and murder. In reply, on July 16th, the Minister of Labour disregarded all these authorities, and advised us to follow the suit of one Western operator, who had "every respect" for Mr. Moyer. Moyer's record is well known, not only his past, which the Minister of Labour would forget, but also his more recent affairs. In addition to the manner in which he carried on the Michigan strike in 1913-14, were his strikes in Arizona during a time when the United States Government was calling for a steady output of minerals for war purposes; his personal incitement of Mexican labor at the border-line camps in Arizona in 1916 during the time of the Villa raids. Yet this is the man, Charles Moyer, still surrounded by the system and organization which he knows so well how to manipulate, one of the organizers and first executives of the I.W.W., that the Minister of Labour would force us to recognize and consult, in the belief that unionism of any kind is better than industrial peace and contentment of employees.

Since that time the Minister has seen fit to give to the Canadian Press a statement to the effect that while the history of this organization prior to the presidency of Mr. Moyer may not have been above reproach, that under his guidance their methods and policy were changed and that to-day the organization is beyond serious criticism.

To confirm his first statement, let us quote some extracts from report of the Royal Canadian Commission—Industrial Disputes 1903, made by the Chief Justice of British Columbia, and Rev. Elliott Rose.

"It is obviously against the public interest that any body of Canadian workmen should be subject to be called out on strike by a foreign authority over whom neither our legislatures nor courts can exercise any control, and that whether they have any grievances against their employers or not. **Whether the wheels of Canadian industry shall run or shall rust ought not to depend upon the decrees of a Secret Council at Denver.** With regard to the organization we think

They ought to be specially declared to be illegal, as their leaders have shown that they care nothing about the obligation of contracts or about the interests of their employers, against whom they are ever fomenting discontent.

That they ignore the constitution and rules of their own organization whenever it suits them to do so.

That they at all times preach the doctrines of confiscation of property without compensation.

That society is divided into two classes, the toilers and the spoilers.

That they justify the use of the boycott and the sympathetic strike.

That they do not disprove of violence and intimidation.

That they are wholly indifferent to the loss and damage that they inflict upon the public, and

That they recklessly allow suffering and privation to befall the families of their misguided followers with regard to whom they are constantly guilty of deception and concealment."

To disprove his second statement and to show that under the leadership of President Moyer their methods have not changed and that violence and intimidation are still their ready weapons, we quote as follows from a decision handed down by the Supreme Court of Michigan in connection with the strike that took place at Calumet during the latter part of 1913 and the early part of 1914. The case concerned the Western Federation of Miners as one of several defendants.

"The affidavits, 84 in number, are freighted with narratives of rioting acts of violence, threats, insults, and intimidation of men, women, and children, too numerous to attempt to repeat here, fully substantiating and showing continuation of the unlawful conduct by Defendants. The affadavits are not only made by employees of complainants and their families, but by others,—officials and private citizens—in many walks of life. They tell of strikers, members of defendant federation and their sympathizers, parading with noise, and insults, and threats, attacking, assaulting, etc. Threatening violence not only to themselves but to their families, to kill, to dynamite, and blow up their homes. Defying the civil authorities, resisting and assaulting officers, of resort to firearms in which employees of complainants, and others were wounded, and other overt acts of lawlessness, disorder, and violence, **clearly substantiating the allegations in complaint's bill, and fairly indicating concerted action on the part of defendants to promote the strike by an aggressive policy of force and intimidation."**

On July 1st the Minister wrote suggesting that a committee of the men elected from each mine should meet the Mine Managers with a view to conciliation, and crystallized the situation as he saw it in the following words:—"**It would appear that the real dispute existing is not so much one of wages but rather a question of the recognition of the Miners' Union.**" On July 2nd we received a letter from the local Union reading in part as follows:—

"We further accept his suggestion to have a representative of the employees of each mine in the Cobalt camp, also of the Northern Ontario Light and Power Company, participate in this meeting, **and without executive committee to represent the Mine Workers' side of the case. The employees of each company to select their representative.**

It is to be noted here that the Union did not accept the Minister's suggestion but insisted on injecting their own executive committee into any such conference.

Replying to the Minister's letter of July 1st we regretted that previous correspondence had not clearly conveyed to the Minister our attitude regarding the Western Federation of Miners and pointing out that he could not expect, having consideration for information previously supplied, the employers of labour and the non-union workers would be contented under the dictation and at the mercy of men of the stamp of Charles Moyer, Jas. Simpson and the Rev. Ivens. We further stated as follows— "We cannot accept your suggestion that we meet a committee made up of representatives from each mine for the reason that the Union, through its organization, would be able to elect its own members to the practical elimination of the non-union men and the committee would be in fact a Western Federation committee. Negotiations with such a committee would be useless."

We with all respect decline to join in a request for a Board of Conciliation since in the words of the Minister himself, the only point to be considered would be the recognition of the Western Federation of Miners, which we would not concede and the result could only mean a continued unsettled labour situation.

On July 14th we answered a wire from the Minister reading as follows:—

"Your letter 10th received this morning. After consultation with Prime Minister it is deemed desirable that delegation representing the Temiskaming Mine Managers' Association should come to Ottawa for consultation with **some** members of the Government on Wednesday morning. The delegation is invited to meet the undersigned at the Department of Labour at 9.30 o'clock Wednesday for preliminary discussion prior to meeting Prime Minister and other members of the Government. The question at issue is one concerning which the Peace Conference itself has gone on record and it has therefore become a matter of international policy, hence the importance of a conference to discuss the matter. Please advise if invitation for Wednesday is accepted."

Mr. McGuire, local chief agitator for the Western Federation of Miners had been in Ottawa in close consultation with the Minister of Labour for some time and this, to our mind, was clearly a plan of the

Minister's whereby we would willingly or otherwise be forced into a discussion of the situation with Mr. McGuire and other members of the Union. Moreover, it is apparent through evidence previously presented in this statemnt that the one and only question open for discussion at such a conference would be recognition of the Western Federation. This we had repeatedly and in all seriousness assured the Department of Labour we could not concede, for reasons above given, and we felt that, to take up the time of the Premier and other members of the Cabinet in discussing a question on which we had previously taken a positive stand, would be an imposition on our part and we respectfully declined the invitation for a conference, but requested that all correspondence be laid before the Premier.

Moreover, there was at this time a strong inclination on the part of the more conservative members of the local Union to withdraw from the Western Federation of Miners and with wages and working conditions admittedly good, continue satisfactory and profitable employment as heretofore existing. In other words, the impression prevailed, that without interference and active participation in the dispute by the Minister of Labour the situation was fast clearing, and the danger of strike practically nil.

On July 16th Senator Robertson replied in part as follows:—

"From information received it would seem important that steps be taken towards a settlement, not later than Saturday next, otherwise a general strike seems inevitable."

It is thus forcibly shown that the Minister practically served an ultimatum on the Mine Managers that they must attempt to conciliate and his statement makes plain that the method of conciliation meant recognition of the Western Federation of Miners, or that a general strike would be called on the Saturday following.

Further confirmation is supplied by the following wires exchanged between the Secretary of the Union and the Minister of Labour, and we would draw particular attention to the concluding sentence of Union's telegram and its unqualified acceptance by Senator Robertson.

To Senator Robertson:

"Reports in press that we stated you had told us to go on strike are false and we are preparing a statement for the press giving the developments throughout the progress of the dispute. The only statement was that you said you did not see that the Department could do much more, **and that you would not ask the men to wait longer in view of the Managers' attitude."**

(Signed) JOS. GORMAN, Secretary,
Executive Committee
Cobalt Miners' Union.

To Secretary Gorman:

"Your telegram received and the statements contained therein are exactly in accordance with the facts."

(Signed) G. D. ROBERTSON.

Again we wrote the Minister on July 21st pointing out that we had reason to believe that previous correspondence would enable Senator Robertson to explain to Sir Robert Borden why we thought such a conference would only be wasting the time of himself and Cabinet. We stated we would be pleased to discuss the matter in full with him, providing that after having read the correspondence, he, the Premier, was then of the opinion that any reasonable business man could knowingly enter into business relations with a foreign organization which is not amenable to the laws of Canada. On July 23rd we received a letter from Senator Robertson arguing that we, the Mine Managers, were entirely responsible should a strike be called.

In the Toronto Star under date July 26th Senator Robertson is reported as stating that we had refused to abide by the decision of a Royal Commission offered by himself; as a matter of fact the Mine Managers have never received such an offer of a Royal Commission from Senator Robertson, who on the contrary had telegraphed the Secretary of the local Union on the very day before the strike (July 22nd) that he was prepared to grant them a Royal Commission had it not been objected to by Mr. McGuire (the Union head) while in Ottawa.

Our knowledge of this wire to the Union came only indirectly through the Mayor of Cobalt and the Minister of Labour must know that his Toronto Star statement is grossly inaccurate. Why should the Minister's decision re a Royal Commission depend on Mr. McGuire? The Minister has a report from another Royal Commission of only two months ago, reading as follows:—

"We would point out that in centres such as Kitchener, Sudbury, Cobalt, Sarnia, Moncton, Grand'Mere, Shawinigan, where organized labour has not been encouraged, but where the wage scale and other conditions have been fairly satisfactory to the worker, as employers do not appear to have difficulty in obtaining an adequate supply of labour, an excellent object lesson is supplied. The original intention, as understood, of labour organizations, was to promote the welfare and better the conditions of labour generally, and if these purposes are adhered to there would be no room for criticism, but when the aims of the officers of these organizations become more political than industrial, encouraging unrest and fermenting dissatisfaction, an undesirable situation is created."

Finally we are forced to the conclusion that the Minister of Labour is much more interested in the absolute recognition of Trades Unions than in promoting industrial peace and harmony; seeing no difference, for example, between the Union of the Mercantile Marine and the Western Federation of Miners; giving little or no consideration to the fact that there is no dispute as to wages and working conditions but insisting, while the opportunity remains, in strengthening at any cost the authority and prestige of those who, like himself, are high in the councils of organized labour.

All the operators are willing and anxious at all times to treat with a body of their own men and employees of a number of companies have committees elected by themselves for this purpose.

At the time the strike was called, the lowest paid man on the pay roll was receiving $4.00 per shift and machine men $5.00 per shift.

The present dispute is one between the mines and the Western Federation of Miners and in no case can it be considered as one between the Mine Managers and their employees. **The mines did not throw their men out of employment, but the Union did** and since the mines will not deal with or through the Western Federation the question of adjusting the present deadlock is one that must be settled by the miners themselves. If this can be done in the near future, much suffering and hardship will be prevented, but if on the other hand the Western Federation can maintain their influence and authority, the mines will continue to flood, coal cannot be provided for winter operation, and of necessity operations will stand suspended at least until the Spring of 1920.

Special Correspondence

NORTHERN ONTARIO.

Porcupine.

The rumours of a few weeks ago relative to the resumption of work on the Porcupine V.N.T. mine were well-founded, it has been learned, but the plan failed to materialize due to various reasons, among which might be mentioned the labor situation. It would now appear probable that should a solution be found for the present deadlock in the labor situation in Cobalt, and which would add somewhat to the favorable labor outlook in the Porcupine Camp, the resumption of work on the Porcupine V.N.T. would soon follow.

The mine is equipped with a mill adequate to treat ore at the rate of around 100 tons daily. While cash in the treasury is understood to be fairly low, yet some 750,000 shares stated to be in the treasury would appear to be ample guarantee that not only can the present mill be utilized in building up a cash treasury, but the treasury shares should be sufficient with which to finance proposed construction work, including the addition of larger milling equipment.

It is rumoured in usually well informed circles that a revision of the terms as recently proposed may be made in connection with the negotiations being conducted with a view to merging the Thompson-Krist with the Porcupine Crown Mines.

It is understood that the Wettlaufer interests together with associates of Buffalo have interested themselves in the Lonsway group of claims, situated a few miles north from Golden City, in the Porcupine district.

It is proposed to carry out a more or less extensive exploration campaign toward which end a diamond drill contract has been let and the work already commenced by Messrs. Smith and Travers.

Mr. Irwin, one of the directors of the Foley-O'Brien mine, situated at the western outskirts of the town of South Porcupine, has returned to Buffalo after having paid a visit to the property.

It is understood that Mr. Irwin will probably make the recommendation to a meeting of the directors soon to be held that the mine be re-opened.

The general impression appears to be that the president of the Dome Mines will make good his promise to mark the beginning of next year by the disbursement of a dividend. At the time the promise was made, not a few mining men felt inclined to fear the likelihood of such a recovery in the financial position of the company. Information eminating from Toronto, and presumably from New York, would indicate that the mill has recently been treating ore at the rate of about 600 tons daily. This would correspond with the statement issued last spring in which it was declared to be the policy of the company, following resumption of operations, to gradually bring the mill up to a capacity of about 600 tons daily. This having now been achieved, further gradual increase would appear reasonable to expect. As to the average grade of the ore being treated, it is unofficially stated to yield about $9 per ton, in which case the daily output would amount to about $5,400, or at the rate of upwards of $160,000 a month. The cost of operating is understood to be high, but the general opinion seems to be that costs and net profits run about fifty-fifty, or at the rate of about $4.50 a ton profit. Should such prove to be true, the monthly net profit would approximate $80,000 and it can readily be seen would soon place the treasury in a strong position.

The company is capitalized at $5,000,000 dividend into 500,000 shares of the par value of $10 each. Of this only $4,000,000 or 400,000 shares have so far been issued. Thus in order to disburse dividends at the rate of 20 per cent annually net profits of only $66,666 monthly is all that is required.

There is one feature, of course, which is important, and that is that mill heads will gradually be reduced as milling capacity is increased. It is expected, however, that the smaller margin of profit realized on each ton of lower-grade ore treated, will be compensated for by the larger tonnage being handled, and that, barring labor difficulties, which now appear extremely remote, the Dome Mines Company is once more upon the threshold of success.

The annual report of the McIntyre-Porcupine is being awaited with interest. Although the company's year ended June 30th, the directorate has followed its much criticized policy of withholding the important information for a far greater length of time than is the custom of leading mining companies.

Not a few shareholders are disgruntled over the treatment accorded them by the directorate, and criticism is open and pointed. Just why the report should be held up each year is difficult to understand. The practice offers great benefit to the few insiders who are thus placed in a position to take advantage of either a favorable or an unfavorable report. This year's report is generally believed to be favorable, but no thanks is due to the directorate for the reason that little or nothing of an official nature is given out by President Bickell since his appointment, except that contained in the belated annual statements. The policy is in sharp contrast to the admirable frankness of the past president, the late Col. A. M. Hay.

Unofficial reports indicate that the net profits realized by the McIntyre-Porcupine during the fiscal year ended June 30th last, amounted to not far under $850,000. During the year three dividends, each for five per cent were disbursed, amounting to $541,542.55. This would leave a balance of something like $300,000 to be carried forward to former surplus of $872,172.75.

At the time of writing it has not been possible to secure any information as to the ore reserves as at the close of the company's fiscal year.

Gowganda District—Miller Lake-O'Brien Mine.

Certain misleading statements have recently appeared in certain portions of the press, in connection with the Miller Lake-O'Brien mine, in the Gowganda district.

The Miller Lake-O'Brien is the only producing mine in the Gowganda field, and ranks among the leading silver producing mines in this country. Recently it has been producing at a rate of upwards of one million ounces of silver annually, being about in the class with the Coniagas, O'Brien, and McKinley-Darragh mines in the Cobalt district, but considerably less than the leading mine, the Nipissing which up to the middle of this year was producing at the rate of close to three million ounces annually.

The statement that the Miller Lake-O'Brien has a re-

serve greater than any other "exclusively silver producing mine in the world," is perhaps one that the O'Brien Limited, owners of the mine in question, would not be prepared to make, and it is considered quite probable that the following statement as it appeared in certain parts of the press was inspired in the mind of some one who is not familiar with the actual situation:

"As already intimated, the Miller Lake-O'Brien in Gowganda has more silver in sight than any exclusively silver producing mine in the world, probably as much as 50 per cent of the total now showing at Cobalt. The district is promising if handled by men who know their business.

"The white metal is not nearly so widely distributed as the yellow, and is in fact practically confined to the Western hemisphere. Gowganda seems to have deposits of much greater vertical extension than those of Cobalt, and when the methods of their occurrence are thoroughly understood the camp will be our main reliance for silver."

The foregoing statement was obviously written by some person not very familiar with the subject under discussion, which fact is indicated by reason of the ambiguous construction, as well as the disregard shown for the facts. It would be wrong to belittle the importance of the Miller Lake-O'Brien mine. The property, as stated, ranks among the leading silver mines of this country. At the same time it is contended to be only fair that the owners of the property should be protected from any of the onus which might follow the circulation of unofficial and incorrect statements.

Fort Matachewan District.

A property of considerable merit, about which very little has been said, is that belonging to "Jim" Nelson, one of the oldest prospectors and miners in this country. The property is situated in the Fort Matachewan gold district, and is several miles north from the centre of activity in the latter field.

The surface outcrops on the Nelson claims show andesite and porphyritic formations, in which veins or mineralised dikes occur running north-east and southwest. Very encouraging gold values have been encountered, including some visible gold. A number of men were taken in to the property this week for the purpose of making a more or less thorough exploration of the surface, including the sinking of test pits.

Gold bearing veins have been found to occur on the Indian Reservation near Fort Matachewan on the Great Northern Bend of the Montreal River, and only a few miles north from the gold discoveries which have during the past year or so attracted considerable attention to the Fort Matachewan district.

It is learned that an effort is being made to determine what the government can do in the matter of making the mineral possibilities of the reserve available for exploration. The reservation is about four miles square and is situated partly in Alma and partly in Baden townships. Gold-bearing veins discovered on the Nelson claims in the township of Baden, and former promising finds made in the township of Alma has served to place the Indian Reserve in the heart of a promising prospective area.

The rock formations in the area are somewhat similar and appear to be a continuation of those which occur as far west as the Ontario-Quebec boundary, passing through Kirkland Lake, Boston Creek, Skead, Larder Lake, etc., and offers an attractive field for the prospectors.

At a depth of 170 feet on the Matachewan Gold Mines (formerly the Otisse), lateral work is being carried on with favorable results. Drifting operations are being carried on in two directions, while crosscutting is also under way.

It is planned to proceed with development work on a comprehensive scale until winter at which time a fair estimate can be made with regard to additions to the mining plant. T. J. Flynn, manager of the mine, came out a few days ago, and is quite optimistic over the outlook.

On Right, T. J. Flynn, Manager, Matachewan Gold Mine.

Kirkland-Lake.

In connection with the merging of the Tough-Oakes Gold Mines with the Burnside, Aladdin, Sudbury Syndicate and Sylvanite, certain portions of the English press has offered more or less serious criticism. The chief objection presented is in connection with the capitalization. In connection with this the "Financial Times," England, states that it is not so much concerned about the terms of the merger as "with the capitalization of the consolidation at a million sterling, with nearly £800,000 in issue to start with and with what we consider to be the slender basis for this valuation." Continuing this criticism, it is pointed out that after reading the official summary of Lieut.-Col. H. H. Johnson,

the conclusion is reached that: "This engineer provides more in the way of prognostications than positive data of value." Further: "There is nothing whatever to show in the summary we are referring to that the consolidated properties will yield a reasonable profit. That remains to be demonstrated. We are told developments 'should' do this thing or the other, that its situation gives one property 'unique possibilities', and so on; but when it comes to facts, we find that the one mine on which there has been a fair amount of development now has 'only a small tonnage of ore reserves in sight," while on the other two Kirkland properties little actual development has been done."

Concerning this, H. G. Latilla, the chairman of the extraordinary general meeting of the Kirkland Lake Proprietary, Ltd., held in London on July 16th, declared that he welcomed criticism, and that instead of the capitalization being unreasonable, it was just the opposite, in that should the merger be completed along the proposed lines it would in reality effect a reduction of about £1,200,000.

Concerning the foregoing, the writer is familiar with the position of the Tough-Oakes Gold Mines, particularly in relation to the present physical condition of the mine. Criticism as to its weak position is quite unfair, for the reason that during the prolonged litigation in which the mine was involved those in charge appear to have devoted their energies toward producing the gold in sight with very little regard for developing in advance the continuation of these deposits or exploring for new ones. In justice to the criticism, however, it must be admitted that it is intelligent, and, therefore, no doubt sincere. The only objection is that in view of the peculiar situation at the mine, the term 'prognostications' appears to be out of place owing to the fact that ore reserves are low, due entirely to the policy of the former control to mine ore accordingly as it was developed. It has been demonstrated that development work has always resulted in bringing ore into sight with remarkable rapidity at the Tough-Oakes, and that there has been no developments that would even indicate that the limit of these deposits have been reached. To the contrary there would appear to be very probability, without making unreasonable prognostications, that a very considerable period of productivity lies ahead. As to whether or not the future will result in the realisation of a reasonable profit on a capitalization of a million sterling is a question of course that only the future can decide, but in the meantime there would appear to be reasons for being quite optimistic over the outlook.

Among the new companies operating in the Kirkland Lake field is the Granby-Kirkland Gold Mines. The company has two claims comprising approximately 85 acres, situated in the township of Lebel about one mile north-east from the Tough-Oakes mine, and a little north from Gull Lake.

Up to the present time about 300 or 400 feet of surface trenching has been done, during the course of which three very promising veins have been opened up at outcrop. These veins vary in width from three to upwards of five feet. On the main or No. 1 vein which is about five feet six inches in width, a shaft has been started and has reached a depth of about twelve feet, at which point the vein shows a tendency to widen. The veins stated to occur in the contact between conglomerate and porphyry formation, and is composed of quartz and altered rock, all of which is highly mineralised. What appears to be lead-telluride occurs in some of the vein filling, an analysis of which is to be made this week. A mud-seam also occurs in the vein.

It is understood the plan of the management is to continue surface exploration during the present favorable weather after which sinking operations will be proceeded with. The company is capitalised at $2,000,000 divided into 2,000,000 of the par value of $1 each. E. Croteau is in charge of the work.

Very satisfactory progress is being made in constructing the macadam road from Swastika to Kirkland Lake. As yet the work has been carried on largely on the western end, adjacent to the railway. A start has also been made on that part which passes over the Kirkland Lake Gold Mines.

As near as can be learned, it would appear probable that the east end may be left over until another year for completion, the present indications being that the first four miles or so will be about all that may be completed this year. This would take in all the mines as far west as the Wright-Hargreaves.

A gold discovery made on a group of claims situated in the township of Bernhardt, in the Kirkland Lake district is attracting considerable attention. The find was made on claim number 6075, being one of a group owned by K. Ayoub of Cobalt.

The rock formation on the claims referred to is stated to consist of keewatin, basalt, porphyry and diabase, in which a vein has been opened up showing a width of from six to eight feet, composed of sugar quartz and schist and containing visible gold. The claims are situated in the southern part of the township of Bernhardt, and on the west side of Amikougami Lake. They have been held for about four years by the present owner, the assessment work having been completed this summer.

Boston Creek.

With the near approach of fall which will draw to a close one of the finest summers in Northern Ontario's history, comes the information that representatives of the provincial government are looking into the matter of offering assistance in the building of a road through the Boston Creek district to the Skead area. As far as the Skead area is concerned, a winter road will be of considerable assistance, and should be built. In the matter of the Boston Creek road, however, the time has arrived when it is found necessary to haul a large amount of equipment without waiting for snow roads, and the belated move of the government is less than had been expected.

It is true that the burdens of the Department are heavy, but no matter to what extent this holds good it is essential that the road-building programme should be guided by the merits of the case. No other mining area bearing anything like equal promise to that of Boston Creek has been left to paddle its own canoe. At least not by any of the party governments which have held power in this province during recent time.

Quite a number of prospectors have left for the scene of the reported gold discovery in The Pas district, Northern Manitoba. According to reports from the north some seventy or eighty prospectors are reported to have left the Porcupine district for the purpose of visiting the reported discoveries, and, if considered advisable, staking claims in the vicinity of the finds.

Matachewan Gold Mine, N. Ont.

The Hollinger Mine.

Matachewan Gold Mine, N. Ont.

According to unofficial information, it is learned that interests of Bedford, N Y., have acquired the property of the Hill Gold Mines, in the Painkiller Lake district, and that the property will be worked under a new name, probably the Beattie Gold Mines.

According to advice just to hand, the Crown Reserve Mining Company has purchased two mining claims in the Larder Lake gold area. The two claims are part of a group of thirteen owned by N. N. Maloof, of Haileybury, and are situated about a little less than half way between the Harris Maxwell, one and a half miles northeast from the Harris-Maxwell and the Kerr-Addison. The claims in question were originally staked by Eli Tripp. Work carried on has uncovered some very promising showings. A highly mineralized porphyry dike which has been uncovered on the two claims just sold, has also been traced over a portion of the group still retained by Maloof.

In the Maple Mountain section of the Elk Lake district a good deal of inconvenience is being caused by the lack of satisfactory transportation facilities. During the past several years a considerable amount of exploration and development work has been done on the White Reserve property and a substantial amount of silver ore has been opened up. This is another district where the government could be of assistance.

Cobalt Strike Situation.

The deadlock in the labor situation at Cobalt continues. After one of the most sincere and unbiased efforts on record, a committee of returned soldiers acting as a neutral body, have failed to find a solution to the labor strike. This committee, after approaching the Cobalt Miners' Union with the suggestion that a ballot be cast on the question of whether or not the men favored a return to work on conditions which existed before the strike was called, which suggestions were rejected, approached the Mine Managers of Cobalt, who granted them a hearing and even went so far as to concede to the request that a system of collective bargaining be agreed upon, and that all employes be taken back without discrimination accordingly as positions should be available. These concessions, presented by the Temiskaming Mine Managers' Association to the Committee of Returned Men, were placed before the workers of Cobalt together with the request that each man, union and non-union, should record his vote as to whether or not he favored the proposition. The matter was placed before the workers without recommendation or otherwise. Regardless of the fact that the workers were asked to vote either for or against the matter of returning to work, or remaining on strike, the executive of the Union ordered the members of that organization to not cast their ballot, under penalty of being expelled from the union. As a consequence of this the ballot taken is scarcely representative of all the workers of Cobalt.

The executive of the Cobalt Miners' Union declare that they recommended to their members that the matter be voted upon, but that the members refused to support the recommendation. This is construed as constituting a lack of confidence in the judgment of the executive.

Owing to the failure of the Returned Soldiers' Committee to find a solution, the strike continues. The situation now is this: The Cobalt Miners' Union oppose the interference of a neutral organization. The Temiskaming Mine Managers' Association refuse to recognize or deal with the Cobalt Miners' Union. Thus, as a consequence of neutral influence or effort being of no avail, the gulf has broadened.

To the neutral observer, the situation presents every indication of being a more or less tame affair for some considerable time to come, in that with the union defying its members to vote on any proposal put forward by neutral bodies, and the mine managers refusing to recognize the union, there would appear to be nolikelihood of a solution being found or even suggested under the present circumstance.

The false impression has gone abroad in badly informed circles that the Returned Soldiers' Committee was endeavoring to break the strike. As far as can be seen, just the opposite has been the case. For instance, in presenting their proposal for the expression of opinion as to whether or not the workers of Cobalt would return to work under a system of collective bargaining, the Committee appears to have refrained entirely from making any recommendations for or against the plan, and presented it as a neutral body, even carrying their neutrality to the point of actually not casting their own ballot on the question, although, as workers in the closed mines and plants, they were legitimately entitled to record their votes. The workers and the business men of Cobalt would appear to be indebted to the Returned Soldiers' Committee for their commendable endeavor to secure an unbiased and representative expression of opinion of all the employes affected in the present labor strike, despite the fact that success has been denied them.

Company Incorporated to Aid Prospecting.

A new company, known as the Prospectors' Development Company, Limited, has been incorporated, which plans the organized development of promising mining properties in Northern Ontario. The company is capitalized at $2,000,000 divided into $1 shares. There has been no promotion stock issued, the entire stock remaining in the treasury. The scheme is the first of its kind to be undertaken in this country and may reasonably be expected to enlist a good deal of support. The incorporators are men of good reputation in the mining field, the following gentlemen being identified with the enterprise: John B. Holden, of Toronto, Harry Oakes, president of the Lake Shore Mine; H. H. Johnson, of the Tough-Oakes; Wm. Wright, original owner of the Wright-Hargreaves' mine; Mr. Bain, of Bicknell, Bain, McDonald & Gordon, and others, which gives assurance of integrity.

The plan is to have prospectors register their holdings with the company, and, if the property possesses merit the holders are to be paid a limited amount of stock in the company, which will carry out the necessary assessment work obligations and receive a small percentage in each claim for each instalment of work paid for. It is planned to carry properties through the prospecting stage and make it possible for the prospectors to still be interested in the mines that may result from work done, instead of, as has been usual, the prospector not getting his full measure of reward in cases where he has been the discoverer of large mines.

West Shining Tree District.

A large amount of diamond drill work is to be done in the West Shining Tree district this year. Although Mr. Hore's recent report on the district marked it as one of more or less uncertainty, but presenting considerable possibilities, the feeling exists that there are

a number of mineralized bodies which should be comprehensively explored.

Not a few conservative mining men have shunned the camp for the reason that it has been boomed by brokers. Conservative newspapers throughout the country have advised caution with regard to dealing in shares of companied operating in that district. The promoters have endeavored to put the public off its guard by charging that certain newspaper correspondents were knocking the camp itself. At the present time, after consulting the opinion of recognized authorities, it may be stated that the West Shining Tree district has some prospective merit. The pay-streaks, of course, are narrow, and the development of the various properties is still a gamble, but all new mining camps must first pass through this stage. At the same time, the necessity for advising caution on the part of the public is stronger than ever, for the reason that when mining engineers or geologists make a report on property they consider only the mineral deposit and not the methods of financing. The would-be speculator should always learn approximately what amount of money received for stock is actually going into the treasury and how much is being raked off by the promoters.

WASAPIKA CUTS VEIN AT 100 FT.

Development work at the Wasapika gold mine is progressing favorably. A cross-cut is being driven at the 100 ft. level from the shaft towards the Ribble vein. This cross-cut has just entered the vein and the indications are that the vein will prove to be very wide. Nearly 9 ft. of quartz has been broken and the face is still in quartz. The quartz is well mineralized.

Herrick Drill in Operation.

Diamond drilling has begun at the Herrick gold mine, Wasapika gold area. It is planned to thoroughly explore the Herrick vein by drilling preliminary to development by shafts and drifts. The shaft is in good ore for 50 ft. and the drilling will give some idea of the nature of the deposit at depth.

West Tree Shaft in Rich Ore.

Sinking of a shaft on the West Tree property on the west shore of Upper Wasapika lake is proceeding rapidly. Some very rich ore is being taken from the shaft.

Across the lake there is a shaft from which rich ore was taken 3 years ago. It is planned to drift across the lake towards this old shaft from the western shaft.

BRITISH COLUMBIA.

Mine Safety and First Aid Competition, Nanaimo, B.C., Sept. 1st.

The Vancouver Island Mine-Safety Association will hold its fourth annual field day, mine-rescue and first-aid competition on Labor Day, September 1st, at Nanaimo, B. C.

The programme will include mine-rescue competition, which is open to the mining world, for the Vancouver Island Mine Safety Association shield and first and second prizes; first-aid competition, team event open to the mining world, first and second prizes; B. C. Department of Mines cup, first and second prizes; W. L. Coulson cup, first and second prizes; V. I. M. S. A. Juvenile cup, sixteen years and under, first and second prizes; two-man event, first and second prizes. One man event, first and second prizes. Teams are expected from Nicola Valley, Eastern B. C., the State of Washington and from all the mining centres of Vancouver Island.

The "Journal" has arranged for a full report of the competitions by its regular correspondent.

Mining Exhibit at Vancouver Annual Exhibition Creating Great Interest.

When the Vancouver Exhibition Association's 1919 Exhibition is opened by Sir Arthur Currie, one of the great attractions will be the exhibit of British Columbia minerals and mining machinery.

The B. C. Chamber of Mines, working in conjunction with the Exhibition Association have arranged for an exhibit, which will display the wealth of British Columbia's mineral resources on a scale never before attempted, and which is sure to draw a great deal of public attention. New samples are coming in continually, and the arrangement of the different minerals will be attractive and with the idea of showing each variety in the best possible manner.

The supply and equipment firms are taking hold in a manner which shows their interest in the exhibit. There will be a concentration plant, a flotation plant, water wheel, and assay furnace all in actual operation, and actual workings of drills, etc. This will make the allied exhibit of much interest to all visitors.

The mining exhibit this year will be of special value, as there will be hundreds of visitors to the exhibition who are touring the Northwest in autos, and they are planning to be at the exhibition during Exhibition Week, this means direct advertising of British Columbia's natural resources.

CONSOLIDATED MINING & SMELTING COMPANY PURCHASE GOLD PROPERTIES NEAR GOUDREAU.

It is reported from Sault Ste. Marie that the Consolidated Mining and Smelting Company of Canada interests have purchased a portion of the Webb-McCarthy-Miller gold properties near Goudreau, the deal involving $400,000.

The holdings acquired by the Trail people include six claims situated three miles east from Goudreau, but Sault men interested have other holdings in the district including three claims of McCarthy and Webb on one side and three other claims of Miller and Huckson on the other.

The conditions of the deal, it is understood, including the construction of a $500,000 plant by the purchasers.

New Interests.

The properties have been gone over twice by J. K. Cram, representing the company, who found the tonnage and general average very satisfactory. They purpose putting in a spur from Goudreau and to start diamond drilling within forty days from date of purchase. Smith and Travers, Sudbury, have contracted for the drilling. The company is arranging for electric power from the Michipicoten Power Company at Michipicoten River.

While results of the assays taken on the property cannot be secured owing to the absence of Mr. Cram, the syndicate which has just disposed of the claim say they are as high if not higher than anything yet found in northern Ontario and that there is ample tonnage in sight to make the development one of the most interesting features of mining the north has ever experienced.

NOVA SCOTIA NOTES.

Nova Scotia Steel & Coal Co.

The N. S. S. & C. Co. has commenced operations on the Stubbert Seam, near Point Aconi, about six miles from Sydney Mines. It is understood the company has in view a continuation of its existing railroad system from the Scotia Colliery, distant about four miles, which will necessitate a bridge across the Little Bras d'Or. It is understood that it is considered preferable to take the coal from the new Stubbert Mine direct from the Point Aconi district to Sydney Mines, rather than commence any minor shipping operation at or near the Bras d'Or.

The production of the Scotia collieries in July compared with July, 1918, as follows:

	July, 1919.	July, 1918.
Princess	13,141	12,161
Florence	16,153	14,306
Scotia	4,797	7,560
Jubilee	6,237	12,191
	40,328	46,218

The outlook for August is said to be much improved, and it is probable that the collieries will work almost full time during this month.

About half the regular working force at the Steel Plant is engaged on repairs, but all the productive operations are suspended.

Dominion Coal Company.

Work at the collieries has been lessened by the suspension of producing operations at the Sydney Plant, and the smaller tonnage of coke required.

The new shaft to the Phalen Seam, situated between No. 1 and No. 2 Collieries is progressing rapidly, and the excavation is now below the Harbour Seam.

The Limestone quarries of the Dominion Steel Company in Newfoundland produced 47,702 tons in July against 45,648 tons in July, 1918. The limestone quarries at Marble Mountain in Cape Breton in July showed an output of 51,176 tons comparing with 46,740 tons in this month last year.

At Wabana, the iron-ore output in July was 68,914 tons. Last July it was 50,933 tons. The production of all the departments of the Mines & Quarries of the Dominion Steel Company was therefore greater in July, but it may be anticipated that the slackening of operations at Sydney will necessitate some reduction in production of raw materials, although it may be expected that this will be brought about rather by a curtailment of the shipping season and an earlier suspension of production as winter approaches, rather than by restriction of output at the moment.

War Loan Savings.

The Maritime Mining Record says:

While quite a number of young miners sold their war bonds, there are many of the married men who deeply regret that the war loan system of saving has passed away. These men openly state that but for the war bond they could never have saved any money. Now that they have a few hundred dollars they would like to have more, but they are convinced that there is only one wa yof getting it and that is the system of payment through the coal companies.

Those who have been able to hold on to their Victory Loan bonds have had reason to be satisfied from a purely monetary standpoint, seeing that the bonds are now quoted at a good premium and are likely to appreciate still further. It has been particularly pleasing to those who have purchased their bonds through the instalment plan on the scheme made possible by some of the coal companies to receive full interest on the June coupon, without any deduction for interest by the company that in the first instance purchased the bonds for its employees. The Scotia Company adopted this plan, and it has been the occasion of much gratification to its employees.

Unfortunately, as the "Maritime Mining Record" states, some of the younger men, and some who unfortunately could not help themselves, sold their bonds, and in some instances there is no doubt that they were taken advantage of by persons who gave them par for bonds that were quoted at 104 and 105.

The "war loan system of saving" has not passed away, however, as another loan is shortly to be asked by the Government. If the coal companies assist their workpeople to buy the new loan, in the same way that they did in the case of the previous loans, equal success will be achieved, allowing, of course, for any depressed trade condition that may exist when the loan is floated.

Working Hours.

As bearing on the determination of the United Mine Workers to enforce a seven-hour day, it is significant to note that the Tenessee Coal, Iron & Railway Company's mines have gone back to a ten-hour day, with time and a half for all time over eight hours, and that on August first this move was followed by the mines of the Republic Iron & Steel Company. The eight-hour day which has been in force since April has proved a decided failure. The longer day is expected to mean a considerable increase in wages, and already a large increase in tonnage has been noted.

That a similar procedure may be experienced in Cape Breton is indicated by the Maritime "Mining Record," which says with reference to the five day week:

"There are many others against the five day week system than President Workman. Some U. M. W. locals protested against it, while many members of most locals are loudly declaiming it. These men openly state that they were led to believe that five days per week meant six days pay, or they would have voted against instead of for. Nearly all daymen say that it does not suit them, and miners and contract men receiving a bonus for steady work want none of it, for they stand to lose from twenty to fifty dollars per month. These men are 'saying things' now and when the loss hits them things will be 'doing' around the collieries. That such a vital question could be so darkly initiated is beginning to arouse the suspicions of the thinking class of the workmen who are beginning to realize that there are others besides politicians who win elections on promises."

The Dominion Coal Company has obtained redelivery of the S.S. "Kamouraska" from Admiralty requisition. With the "Lord Strathcona" also recently released, this company should be in a much improved shipping condition.

About fifteen to twenty years ago, the Dominion Coal Company formed sales conections in Norway, and some coal was shipped there from the Cape Breton collieries. It is announced that recently the Furness Withy people shipped 3,000 tons of Cape Breton coal

to Norway by the "Bratland," and that a further order for 10,000 tons has been received at the mines. Two steamers, "Brad" and "Mons" are due at Sydney about Sept. 1st for further cargoes for Norway. In this instance Cape Breton coal is being substituted for English coal.

It is significant of the reversal of trade conditions brought about by the war that Cape Breton coal can be shipped to Norway and sold in competition with English coal—or rather in default of English coal—and that Cape Breton coal cannot compete with United States coal in the Montreal market.

A VAIN PETITION.

The most arresting article in a late issue of the Springhill paper was a letter of a correspondent. Here is the letter, unnecessary words omitted. "I am a church member and member of a labor union. I try to be consistent. I attended prayer meeting the other evening and was called on to pray. Among my supplications I humbly asked that in view of the fact that a majority of the workers were day laborers, and in all probability would be reduced to five days a week that God work on the hearts of our statesmen to do something to reduce the high cost of living. At this point a man in the audience got up and said he could not listen to such talk. He told me I was no friend of labor. Said he: "How can the Lord reduce the high cost of living without reducing wages.'" And we too, not facetiously not lightly, but, in all honesty ask "How can He?" — Maritime Mining Record.

LARGE COAL EXPORT ORDER.

Philadelphia.—It is reported that a New York firm has been successful in placing with Pocahontas operators a contract for 500,000 tons of coal a year, for three years, or a total of 1,500,000 tons, for export to Great Britain.

Assurance was given that bottoms for transatlantic shipment would be available, and the entire contract is reported to have been at a fixed price. Export coal of this high grade is commanding $1 to $1.50 premium over the domestic price and it is assumed that this would be attractive to Pocahontas region shippers in a long-term contract such as the present instance.

WORLD'S DEEPEST OIL WELLS.

Of four deepest oil wells in the world, two are in West Virginia, one in southwestern Pennsylvania and the other in Germany. Deepest well is the J. H. Lake, of the Hope Natural Gas Co., which was abandoned at 7579 feet.

Second deepest well is the M. O. Goff drilled 7386 feet, about eight miles northeast of Clarksburg, W. Va., also by the Hope Natural Gas Co. Third deepest is at Czuchow, Germany, and is 7348 feet deep. Fourth is the R. A. Geary, drilled to a depth of 7248 feet, in southwestern Pennsylvania, by the People's Natural Gas Co., according to the United States Geological Survey.

In comparison with these depths, other depths reached by wells or mines are insignificant. Depest mine in the world, for instance, is shaft No. C of the Tamarack mine in Houghton county, Michigan, which has a depth of 5200 feet.—Boston News Bureau.

HOLLINGER CONSOLIDATED GOLD MINES, LIMITED. INTERIM REPORT, 1st JAN. —17th JUNE, 1919.

The Interim Report of the Hollinger Company covering the 6 four-weekly periods from 1st January to 17th June, shows income and disposals as follows:

Income	$3,166,625	
Expenditure	1,646,868	
		$1,519,757
Dividends		738,000
Added to Surplus		$781,757

Current assets, plus bullion assets, total $3,346,575, which less current liabilities, leaves a surplus of $2,-853,043.

The number of persons employed totalled 1,344 at 17th June against 1,311 at March 25th, an interesting feature being the slight decrease in the non-productive

A Quartz Outcrop of the Hollinger Property.

force and an increase of 40 men in the mining class. The number of miners obtainable is understood to be less than could be employed, but the labor troubles in the Cobalt and Kirkland Lake camps have helped the situation to some extent.

The mill ran 69 per cent of the possible running time, treating 316,386 tons of which 50,477 tons came from development. The average value of the ore treated was $9.93 per ton. Cost of treatment totalled $4,95 per ton.

An Unusual View of the Hollinger.

We believe the world will better know how to behave itself and keep the peace when it has learned that imports are the only international currency that pays for exports and that all schemes to blink, dodge or sidestep this fact can lead only to dispute and conflict. Trade is barter, money is but a poker chip, and the thought of money as wealth in itself gives life to the old proverb: "The love of money is the root of all evil."—Stephen Bell, in "Commerce and Finance."

THE REPORT OF SIR ARTHUR DUCKHAM MINORITY REPORT OF THE BRITISH COAL COMMISSION.

Asquisition of Mineral Rights.

The whole of the mineral rights of Great Britain should be acquired by the State, the value of such rights being estimated in each case on the same basis as adopted by the Inland Revenue in assessing ownership of minerals for death duties (the evidence of the witnesses from the Inland Revenue Department clearly shows the principles), due regard being given to the change in value of money owing to the war, increased taxation (with the exception of the Excess Mineral Rights Duty), etc. No increased value should be given in cases where it can be shown that mineral owners have used improper pressure to obtain royalties above those commonly obtained or in the case of sliding scale royalties which have become excessive through war conditions. Compensation should preferably be paid in the form of annuities, as suggested in Mr. Walter Leaf's evidence.

Ministry of Mines.

A Ministry of Mines should be set up, which should, at a later date, form one of a group of Ministries attached to a Ministry of Industry. The duties of the Ministry of Mines should be (inter alia)—

(a) To supervise and control all mineral rights throughout Great Britain and to ensure the proper working of all minerals.

(b) To ensure the making of a complete geological survey (including the systematic proving of all coal areas) of the whole country.

(c) To be responsible, through its inspectors, for the proper equipment and running of mines to ensure safety.

(d) To initiate and, if necessary, carry out research for the improvement in the conditions of those working in and about mines, better methods of winning coal, etc.

(e) To undertake the study of the special diseases of underground workers and to initiate special treatment.

(f) To exercise any control of the industry which a national emergency may render necessary.

(g) To advise the Minister of Labor as to the special conditions present in the coal industry.

(h) To co-operate with any Government Department set up for the conservation of fuel.

Area Commission.

A Commission assisted by experts acquainted with the various districts should at once be set up to decide the areas into which the country should be divided (all mining interests in each of such areas being amalgamated) in order to obtain the best economies and efficiencies in the winning and working of coal. The areas should not be larger than necessary to ensure:—

(a) The most efficient draining and pumping for the whole area.

(b) The most rapid transport of the coal to the surface and the miner to his work.

(c) The obtaining and distribution of power from one centre.

(d) The prevention of waste of coal by artificial barriers, etc.

(e) The proper handling of the various classes of coal produced in the area.

Unification.

It is essential that all the colliery interests in the areas specified should be amalgamated in order to obtain proper working. The amalgamated interests would be granted a lease by the Crown to work coal and other necessary minerals.

Method of Unification.

It is possible to prepare a variety of schemes to attain the primary object of unification in areas, but the following proposals are made to illustrate the intention. The proposals assume the discontinuance of the present system of control.

The whole of the mining interests in each area should be amalgamated into a Statutory Company (hereinafter called "a District Coal Board.")

(a) The total par value of the shares issued by any Board shall not be greater than the total value of the various amalgamated interests as going concerns at the present time, but valued at 1914 prices, due allowance being made for capital expenditure since that date at enhanced prices.

(b) The shares of the District Coal Board should be of one class only and should be entitled to a minimum rate of dividend of 4 per cent which should be guaranteed by the Government.

(c) Profits in excess of those necessary to pay the 4 per cent dividend and usual depreciations may be utilized—(i.) to form such reserve funds as may be approved by the Minister of Mines. (ii.) To pay a further 2 per cent dividend.

Of the remaining profits one-third may be utilized for paying further dividend on shares, but the other two-thirds must be used to reduce the price of coal.

The above proposals for the division of profits do not preclude a bonus on profits being paid to the managerial and clerical staff. This would correspond to the bonus in output proposed below for the manual workers.

Government Right to Take Over a District Coal Board.

The Government shall have the right to take over the shares of any District Board, should the Board have called upon the Government in four years out of a consecutive seven years to make advances to pay the guaranteed dividend and the Board failed to repay within seven years any advances made. The compensation to be paid by the Government for the shares so acquired should be based upon the profits earned by the undertaking during such seven years.

Board of Directors.

The number of directors on each Board should be not less than seven. All except three of the directors should be appointed in the ordinary way by the shareholders. Of such three directors, one should be elected by ballots of the agents, managers and undermanagers, and two by ballot of the workpeople engaged in the area.

Government Representative.

The Government, as owner of all minerals in the area, should appoint a competent mining engineer to safeguard the interests of the State. He should have the right to attend directors' meetings when he desires to do so, but should have no voting power.

Agents, Managers, and Undermanagers Representatives.

The agents, managers, and undermanagers have and will continue to have legal obligation for the proper and safe running of mines. They, therefore, should be represented on the Board of Directors. Their expert advice would be invaluable.

Workmen's Representatives.

Labor has a special claim for representation in the directorate as wages form the predominant item in the cost of production and the conditions of the industry are necessarily hazardous. The other directors would benefit greatly by having actual workers on the Board with a close knowledge of conditions, and the workmen would have a definite voice in the conduct of the industry.

Minimum or Standard Wages.

The minimum or standard wages for mine workers should be considered and settled together with the general wages of the country. Whichever machinery may be set up by the Minister of Labor for this purpose should be utilized.

Committee For Settling Rates and Wages.

Special rates and wages should be settled for the area of each District Board. The basis should be the agreements at present in force which have been arrived at after years of experience. Conciliation Boards on similar lines to those now existing shall deal with special wages and disputes.

Payment by Results.

The wages of all workpeople and employees should be guaranteed by minimum or standard rates. An equitable system of payment on increased output and efficiency should be arranged and made applicable as far as possible, to all manual workers in addition to the system of piece-work rates at present in force.

Associated Undertakings.

Where a colliery undertaking is attached to other industrial undertakings, such as iron, steel-works, by-product ovens, etc., the value of the colliery undertaking should be separated and included in the holding of the District Coal Board. The colliery should then be leased back to the original owners, who would have the right to raise and use all coal necessary for their own purposes, but they should have no powers to sell coal as such except through the District Coal Board.

Pit Committees.

At each colliery a pit committee should be set up with the manager as chairman and representatives of each main class of workmen employed in or about the mine. The pit committees should meet at definite intervals and would be competent to discuss and make proposals on:—

(a) Safety of the mine;
(b) Conditions of working;
(c) Improvement in methods;
(d) Comfort and well-being of the workers while in the mine or colliery premises;
(e) Any disputes that may arise other than wages disputes.

Wages would not be discussed at pit committee meetings.

Multiple Shifts.

The general extension of multiple shifts, as the most ready means of increasing output, reducing costs, and improving wages to the workpeople as a whole, should be immediately considered by a joint committee of the Government, owners, and miners.

Coal Traffic.

The question of the economy of coal traffic and private ownership of wagons should be dealt with by the Minister of Ways and Communications in conjunction with the Minister of Mines. The interests of the consumer must be safeguarded, and the consumer must be given free choice of fuel to ensure proper economy in its utilization.

Publicity.

It is essential that there should be complete publicity as to the operations and financial results of the coal industry. The Ministry of Mines should be expressly charged with the duty of publishing, not less than once a year, figures showing the cost of getting coal in each of the districts of the country, and the proportion chargeable to materials, wages, general expenses, interest, profits, and other general items.

SUB-AQUEOUS PROSPECTING.

In an interview with the Victoria "Daily Times," Mr. Vaughan M. Lavery, of Le Pas, Man., recently returned from overseas service in a tunnelling unit, suggested that in course of time prospecting in Northern Manitoba would be done with the aid of diving equipment. The country is of the "rocky lake" type, and in many instances the rock exposure which is being following by prospectors disappears under the waters of a lake.

Apropos of Mr. Lavery's suggestion, readers of the "Journal" may be interested in the accompanying photograph of the bottom of the Kerr Lake, snapped by Mr. R. E. Hore a month ago. Fine crops of oats and potatoes were growing on the ancient mud bottom, which has dried out in fine laminations that in section looks not unlike the so-called "paper shales."

An interesting feature of the lake bottom is the glaciated silver-bearing rocks, showing the glacial marks in a surprisingly preserved condition. In some

The Bottom of Kerr Lake.

instances the native silver had been "plated" on the surface of the rocks by the weight and slow movement of the overlying glacial mass.

Mr. Lavery's future prospector will probably be able, in his sub-aqueous geological investigations, to dispense with the old-fashioned diving-apparatus that requires an air-pump and a breathing-tube communicating with the surface of the water, and will be equipped with the self-contained compressed-oxygen diving-helmet, and be thus enabled to "fossick around" at will in shallow lakes.

Incidentally, Mr. Lavery considers that in ten years time the Northern Manitoba district may be the richest mining area in North America.

See our exhibit at the Fifth National Exposition of Chemical Industries Coliseum and First Regiment Armory, Chicago, week of September 22.

AMERICAN INSTITUTE OF MINING AND METALLURGICAL ENGINEERS.

Chicago Meeting.

In view of the large number of coal mines centered about Chicago, it is planned to make the Chicago meeting, to be held at the Congress Hotel, September 22-26th, of special interest to the coal industry. A large proportion of the 150 technical papers prepared for discussion will be on subjects related to coal, coal mining and coke. Among these is a carefully prepared symposium on sulphur in coal. Excursions have been arranged during the meeting that will be particularly attractive to the coal man; on Thursday the trip to LaSalle will include the inspection of operating coal mines in the district, and late Thursday night a party will leave for the mines in Franklin and McCoupin Counties, where some novel and ingenious ideas in plant design and methods of operation have been adopted and proven practicable. The trip to the Gary Steel Mills on Tuesday will include an inspection of the immense coke ovens and by-product plant.

Metallurgists and electrical engineers will be much interested in the demonstration to be made of the production of metallic tungsten and molybdenum at the plant of the Fansteel Products Company, North Chicago, on Tuesday, September 26th. As a part of the programme for the Chicago meeting, an excursion has been arranged to Milwaukee, to visit the various mining machinery plants in the vicinity, and a stop will be made en route at the Fansteel plant. The entire metallurgical process will be shown, from the preparation and purification of the commercial concentrates, and including sintering the pulvurent metal obtained into homogeneous billets by the use of currents of enormously high amperage.

The National Exhibition of Chemical Industries is being held at the Coliseum, Chicago, the same week as the Institute Meeting. Members of the Institute have been extended an invitation to attend this exhibition.

THE "CANADIAN MINING JOURNAL" IN CHICAGO.

The Canadian Mining Journal, and the other technical periodicals published by the Industrial & Educational Press at Ste. Anne's will be "at home" in Booth 138 at the National Exposition of Chemical Industries from the 22nd to 28th September in Chicago.

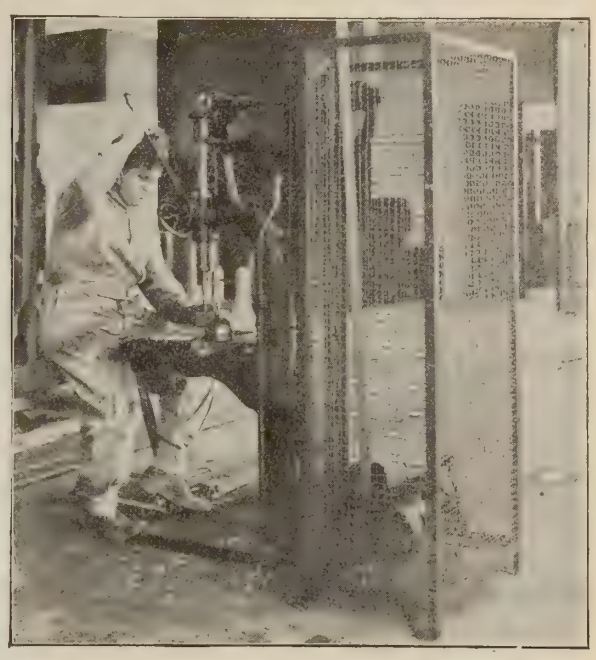
Mr. H. W. Thompson, the western advertising manager of the "Journal," with his assistants, will have charge of the booth.

A cordial invitation is extended to all friends and readers of the "Journal" to make themselves at home.

The other magazines of the Industrial & Educational Press, which will be represented are "Pulp & Paper Magazine of Canada," "Canadian Textile Journal," "Canadian Fisherman" and "Iron & Steel of Canada."

Isn't it a fact that most people have a sneaking admiration for the action of the German Admiral in scuttling his ships at Scapa Flow. And suppose — something that is unthinkable — that British ships should have been placed in a similar position, would not they have found the bottom? The incident occurred because the British Navy, for political reasons, were appointed guardians for the Allies, but not given the right to post a guard on the German ships. The Germans "put one over" on the Allies, but did not the laxity of the Allies invite the incident?

Oxy-Acetylene Welding and Cutting



Used Wherever Machinery Is In Constant Daily Use

In nearly every line of metal manufacture, from the making of delicate jewelry to massive locomotives the Prest-O-Lite Process of Oxy-Acetylene Welding has firmly established itself. Where two pieces of metal are to be joined, it is supplanting the bolt, rivet and threaded joint in hundreds of factories and repair shops.

Metal lockers, as shown in the illustration, and metal equipment of all kinds can be produced at less cost by this process.

Wherever metal or machinery is produced, moulded, built, shaped or USED, there a Prest-O-Lite outfit will be found of inestimable value.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange to full cylinders for empty ones; provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe, automatic regulators and gauges; and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you. Write for it.

PRINCE OF WALES VISITS HIS MINES IN THE DUCHY OF CORNWALL.

Previous issues of "Mine & Quarry" have described the great interest which Cornish mining men have taken during the past two years in the introduction of Sullivan diamond core-drills for prospecting in the mines of Cornwall. The accompanying photograph was taken on the occasion of a visit of the Prince of Wales, who is also the Duke of Cornwall and Devonshire, to the Kit Hill Mine in June, 1919. The "Western Morning News" of June 11th says, "Because of the enterprise of the Duchy management in installing up-to-date machinery, these mines are providing valuable quantities of tin and wolfram, the supplies of the latter having proved of great national service during the war. The Prince showed a decided aptitude for making the most of his time, and was shown, what is a novelty in Cornwall, the new Sullivan diamond-drill, which began its work of boring on May 28th. This drill bores out a core of rock about one inch in diameter, from which can be learnt the properties of the lode, the object of the drill being for prospecting. It has already bored about 120 feet, the average being about 12 feet per day (horizontal holes in single shifts) and its ultimate depth will be over 700 feet. The Prince spent some time watching the drill at work and displayed a very keen interest asking many questions relative to the working of the drill. Specimens of metal which had been extracted by the drill were also shown him."

The Prince in the photograph is shown close to the swivel-head, watching the machine work.

Mr. W. H. Seaman, Jr., has accepted a position with the Matachewan Gold Mines. His address is Elk Lake, Ont.

Prince of Wales in Cornish Tin Mine

:-: EDITORIAL :-:

THE PRINCE OF WALES.

Racey, the clever cartoonist of the "Montreal Star" expressed a happy symbolism when he recently portrayed Canada as a smiling maid disclosing the treasures of our Dominion to our visiting Prince.

Youth will be served, and youth has a spontaneous companionship with youth that is denied to those of maturer years. The youth of Canada has been to the wars, young maidens as well as young men, and the Prince was there too. In this fact lies a bond that ensures the Prince a royal progress throughout Canada, such as the Dominion has never seen before.

The Prince of Wales comes to us smiling and debonair, speaking both the tongues of our country, at the victorious conclusion of a bitter war in which Canada did what her people conceived to be their duty, and from which the Canadian people has emerged a nation acknowledged as valorous and as one of the League of Nations.

Surely the signs are propitious that bring this young Prince at this time to a people that has been stirred to its depths by the wounds it has suffered in a war in which it voluntarily assumed unprecedented responsibilities and burdens, and which, without boasting, it knows it materially assisted to win.

The ideal for which our young men died is symbolized in the Prince of Wales, as he also symbolizes for the bereaved parents of Canada the youth they mourn, and all this, the summation of five years of tense national living, when added to the undisguised and boyish pleasure shown by the Prince at the lively reception given him in his progress, is part of that amazing community of interest and ideal, that intangible, sometimes seemingly incongrous and contradictory spirit that binds together the commonwealth of the British peoples.

HOISTING MEN IN B.C. MINES—NEW SAFEGUARDS.

As a result of the lessons learnt from the investigation of the causes of the accident at Nanaimo by which sixteen men were killed through the breaking of a hoisting rope, the Coal Mines Regulation Act of British Columbia has been amended by the insertion of new clauses requiring that all cage chains in general use shall be annealed once in every six months, and that detaching hooks shall be cleaned and re-fitted once in every three months. It is also required that every winding-rope shall be given a bath in hot oil before being put on, and that every winding-rope shall be re-capped at intervals not exceeding six months. It is also provided that no winding rope which has been in use for more than two years, or which has been spliced, shall be used for raising and lowering persons.

These are all very necessary, and rather elementary precautions, and if they are strictly enforced the risk connected with hoisting men in mine shafts should be much lessened.

Examination of the thimble or ring through which the hoisting rope passes immediately after leaving the pulley is also necessary. There is a case on record in Nova Scotia where the detaching hook failed to hold the cage because the ring had been worn too wide by the constant friction of the hoisting rope.

Hoisting ropes, and indeed wire ropes of all kinds used in mining, are too often neglected. Haulage pulleys are not replaced when broken, and are often found so worn or misplaced as not to revolve. The haulage rope drags on the wet ground, often in acid water, and altogether wire ropes are more often misused than used. Ropes supplied by good makers are manufactured with sufficient internal lubrication to last for a reasonable time in use, but no manufacturer can overcome the results of later neglect to lubricate, or of mis-use. Above all, no rope should be used too long. Ropes that are too weakened or too old for one situation often do very well in lighter work, but most accidents in connection with ropes occur from too prolonged use.

MINING COURSES FOR WORKING MINERS.

The August Bulletin of the American Institute of Mining & Metallurgical Engineers contain an announcement with regard to the commencement of a "Co-operative Department of Mining Engineering" in the Division of Science and Engineering of the Carnegie Institute of Technology, the especial interest of which lies in the attempt that is to be made to afford an opportunity for higher technical education to men who have, as the "Bulletin" phrases it, "made good" as practical coal miners.

This is the great lack of technical education as applied to coal-mining, or indeed any kind of mining, in Canada. There exists abundant opportunity for the young men who can attend university classes as a day student for a number of years, but there is a great hiatus between these institutions of learning and the "man at the face."

In a Bulletin dealing with the coal mines of Nova Scotia, written four years ago, the Editor pointed out that in Nova Scotia the provincial government had provided a Technical College at Halifax where mining and general engineering courses could be taken, and

that there were five other colleges in Nova Scotia at which engineering courses could be taken, yet, with all this provision of educational institutions, not one of them has the financial resources to equip really adequate laboratories for research work, nor are any of these colleges sufficiently near to the mining districts to allow the use of their laboratories and scientific equipment by students who work during the day and attend schools in the evenings.

It was suggested that it might be found possible by a system of scholarships awarded on the excellence of work done in the evening mining schools, to select promising students for short mining courses in Halifax, and "thereby remove the financial limitation that prevents many young miners from taking advantage of the Halifax Technical College."

This difficulty is still a very real one. One of the most promising attempts to remedy it, is the Haileybury Mining School, which, fortunately it has been found possible to place within tram-distance of the mining activities of Cobalt.

The wealth invested in Canada's coal mines, and the number of persons employed therein, is of course very small compared with the phenomenal status of the United States coal industry, and we have not such wealthy foundations as the Carnegie Institute to help our educational authorities, but unless some feasible bridge is provided by which the son of the miner, and the son of the minor colliery official, can obtain a more adequate education in the science of mining, these men will continue to suffer under a heavy disability. This does not mean that many Canadians have not been able to forge their way to positions of responsibility and eminence in the mining profession minus the aid that a university education would have given them, but they have done so despite their lack of opportunities, and many deserving men have just failed to grasp that higher status in their profession that a little more technical education would have given them. They have seen the son of the stranger take the positions they themselves should have filled, but for this small yet fatal lack.

One of the problems of the large mining companies is to find suitable men for official positions. One often hears the complaint that our young men are not what they used to be, but a little thought will show the unfairness of such a complaint. The truth is that in some of the provinces of Canada we have not only failed to keep step in the educational march, but we have slipped back.

Technical education in coal-mining should not consist of sufficient knowledge of formulae and text-book lore to pass an examination for a certificate of competency in an official position. There is nothing of less real value as the test of a man's fitness for official positions than the average examination, which is a test not of knowledge, but of memory.

There should be some means provided by which students, already working in the mine, should be selected and given the opportunity to take such a course of technical training as will occupy from six months to two years. Until this bridge is built, the mining industry can never draw fully upon that reservoir of material composed of the working mining population itself, which if heredity and native skill goes for anything, should provide the very best kind of officials. We are daily wasting our national man-power when we leave untapped this great body of hereditary occupational skill. Indeed, such a course is worse than waste, because the brains that might under proper training have served to build up the mining industry, may, because of thwarted opportunities and lack of outlet for intellectual energies, turn around and pull it down, as they have done elsewhere.

RUIN AND RESTITUTION IN FRANCE.

We reproduce in the current issue of the "Journal" a description by Dr. Frank H. Probert, a first-hand and competent witness, of the far-reaching economic destruction carried out by the Germans while in France, and particularly just before they were driven out by force of arms.

Thanks to the courtesy of the Editor of the "Mining & Scientific Press," from which excellent periodical Dr. Probert's article is copied, the "Journal" is able to include a series of original photographs taken by Dr. Probert, which are of a nature to make comment superfluous.

"WILD CATS."

It is pleasing to learn that the Ontario Government contemplates following up its recent prosecution of doubtful oil promotions by devoting some attention to the more than dubious mining stocks that are being so freely advertised at this time.

Reports of a revival of mining activity from every part of Canada are reaching this "Journal," and in British Columbia as well as in Ontario the quickening of interest in mines is being accompanied by the unwarranted booming of unproven mining ventures. Some remarkable phrases are being used to dazzle and attract the moths to the candle. One advertisement referred to cross-cutting "in the sheared zone of third enrichment" which sounds like something, but really means nothing.

Other advertisements emphasize the proximity of prospects which are being promoted to proved mines, which also implies nothing. Again, one reads of surface veins which are expected to join at depth, and when so joined are expected to contain high values.

Some extremely reputable newspapers are opening their advertising columns to this kind of bunkum information that is intended to deceive, properly characterized by the Attorney-General of Ontario as being vague, illusive, and mainly "glittering generalities of the 'get-rich-quick' variety."

The Geology of Ontario as it Affects Gas and Oil Production

By DR. M. Y. WILLIAMS, D.G.S., Ottawa, Ont.
Presented at the Organization Meeting of the Natural Gas and Petroleum Association of Canada, London, Ont., June 18th, 1919.

Both gas and oil are rock products and controlled in their occurrence by geological conditions. It is, consequently, the work of geologists to seek out and interpret the controlling conditions.

Investigations follow two main channels: first, the study of rock outcrops; and second, the study of well samples and well records. Without the study of exposed rocks we could not determine the age or many of the characters of the rock formations, and without the drillers' records, we would, for the most part, be in the dark as to the conditions of oil occurrence.

For gas or oil accumulation the necessary conditions are: the presence of oil or gas in the formation being tested; porous rock which may contain oil or gas; an impervious cover rock, or in some cases an impervious basal formation; and last but not least, suitable rock structure to cause oil or gas accumulation.

In general, oil and gas occur together, in varying relative proportions, and are accompanied by salt water. Because of the greater specific gravity of salt water, the oil and gas are caused to accumulate in anticlines and domes, at abrupt changes in rock dip, or in the upper parts of lenses of porous rock. Where no water is present with the oil and gas, or where the formation is only partially filled with these fluids there is a tendency for pools to form in synclines or basin structures above an impervious floor rock.

In Ontario five formations have produced gas and oil and a sixth is reported to have produced gas. Starting with the highest formation and going downward, these are, the Corniferous, the Salina, the Guelph, the Clinton, the Medina and the Trenton.

The Corniferous (also known as the lower or big lime and by geologists divided into an upper division called the Delaware limestone, and a lower division called the Onondaga limestone) formation is the producer of oil at Petrolia, Bothwell, Oil Springs, Mosa and other smaller fields. The Salina is reported to be the gas-bearing formation of the Kent field and one of the oil-bearing formations of the Tilbury Field.

The Guelph formation produced oil in the Leamington Fletcher, and Wheatley fields, and gas in Gosfield, Mersea, Wheatley, Tilbury, Oil Springs and Shetland.

The Clinton produces gas in the Onondaga, Caledonia, and Cayuga fields and at Port Colborne west of the canal.

The Medina sandstone is the main gas producing formation of the Niagara Peninsula, near Brantford, in the Port Dover and Delhi fields and elsewhere, and produces some oil in Onondaga township near Brantford.

The Trenton formation has produced small quantities of oil on Manitoulin Island, at Milton, and near Kingsville. It is now attracting merited attention because of its commercial production of both oil and gas in Dover West township.

The important problem for us all is the future production of oil and gas. We will consider this by formations.

The Corniferous formation has been, obviously most explored, 1st because it occurs at shallow depth, and 2nd because it is penetrated in the drilling of deeper holes. The oil occurrence corresponds closely to the rock structure and new fields are best explored after careful structural work has been done such as that carried through to such splendid success by F. J. Carman and John McLeod in Mosa Township. Portions of Eastern Lambton county, Western Middlesex county and a few selected areas in Elgin and Kent and possibly Essex counties are still insufficiently explored.

I can say little of the future of the Salina formation as at present it is not clearly differentiated from the Guelph.

The Guelph formation lying west of a line drawn from Southampton past Kitchener to Paris, and north of a line from Paris to Windsor can scarcely be said to be explored outside of a few localities, such as Oil Springs. The structure in the Guelph is not easy to determine as where salt lenses occur in the overlying Salina formation the Guelph is not parallel the higher formations. There are no horizons in the Guelph which can be readily recognized from place to place, and hence the structure is not readily worked out, even where numerous records are available.

The Clinton and Medina formations have been carefully explored, and the gas companies are well prepared to explore any untested areas.

The Trenton is perhaps the most alluring and at the same time the most illusive of the oil and gas bearing formations of Ontario.

On Manitoulin island where it has been drilled at several places, the formation varies in depth from surface outcrops to about six or seven hundred feet from the surface. Oil has been struck in a number of wells, but the supply did not last. However, the wells were drilled too near the outcrops to test the field properly and no attempt was made to work out rock structure.

The recent careful and systematic work carried on by the Union Natural Gas Company in Dover West Township has been crowned with success, and a commercial production of oil and gas is being obtained from the Trenton at a depth of 3,000 to 3,500 ft. We learn from this drilling, however, that pockety, porous rock seems to control the accumulation of oil and gas, which here occurs in a syncline. Only a small quantity of salt water is present. If any general theory can be deduced from a study of the Dover field it is that low, rather than high structure is favorable for oil in the Trenton formation.

Besides the south half of Manitoulin island, large areas of land underlain by untested Trenton lie between Lakes Huron, Erie and Ontario, and a line drawn from Collingwood to Port Hope.

One other area of possible value for oil and gas is to be found to the west and south of Hudson Bay. Here the Corniferous and the Trenton formations have been found, and it is probable that the Guelph also occurs there. It is my plan to start for Moose Factory on James Bay the 1st of August to study conditions affecting oil or gas occurrence.

Ruin and Restitution In France

By Frank H. Probert.

It is almost five years to a day since the fostered dreams of world domination by Germany assumed tangible expression by challenging the balance of power. The dream is dissipated, right has conquered might, but at what cost! During the seemingly endless days of struggle the Allies looked to the United States for moral, financial, and material support, and finally for the man-power that gave strength to the knock-out blow. The peace treaty was signed after much discussion, deliberation, and delay, in the same room at Versailles as witnessed the preliminary parleys for the exacting treaty imposed by Germany on the French, concerning the price to be paid for the Franco-Prussian war, but has the world caught the reflection from the Hall of Mirrors of the ruins of northern France, or the image of crimes unthinkable? This is not the time to arouse or excite hatred of the Hun, but 'lest we forget' that the wounds of France still gape and that crippled industry will have to struggle for many years, a few close-up views are worth contemplating.

In 1918 M. de Billy,* as head of the French High Commission visiting Washington, invited Secretary Lane of the Interior Department to send a commission to France to study the condition of the coal and iron mines and discuss with French engineers plans for the future. At that time many properties had been destroyed by shell-fire—a destruction inevitable in waging such a war—but since June 1918 ruin of another kind has been wrought and wrongs done that cannot be excused, explained, or exculpated. In January of this year I visited the Western Front as a member of the American Mining Mission, my associates being Dr. F. G. Cottrell, and Mr. George S. Rice, of the U. S. Bureau of Mines. Every facility and courtesy was extended to us by both the French and United States governments to carry out the investigation, and in three months we motored nearly 2000 miles through the Pas de Calais and Nord districts of the Valenciennes coal-fields, the iron-ore districts of Luxemburg, Lorraine, and Lorraine Annexée, and the coal areas of the Saar Valley. My remarks are not based on hear-say information; my convictions come from close personal contact with the conditions as they exist to-day, and the accompanying views were portrayed by my camera. Documentary evidence is available to show that it was the intention of Germany to destroy the mines of France and so render her commercially impotent; field evidence shows that their plans were executed systematically, scientifically, and almost successfully.

In order to understand the German strategy of the Western Front it is necessary to look back fifty years At that time Germany had great coal mines in Westphalia and the Saar province, and but limited iron ore resources. The possibilities of Eastern Lorraine were being proved and by the Treaty of Frankfurt, signed on May 10, 1871, France ceded to her conquerors all the outcrop mines of the vast iron-field. The boundary was drawn with meticulous care, guided by engineers and geologists, to include all the land known to be commercially mineralized, but when Thomas and Gilchrist, two English metallurgists, developed the basic Bessmer process to treat high phophorus ores, the French explored the lands to the west of Lorraine Annexée, with the result that in 1913 the known reserves of the great Briey basin were owned by the Germans and French in the ratio of 2,330,000,000 to nearly 3,000,000,000 tons respectively.

Immediately following the close of the Franco-Prussian war the Germans developed their steel industry with great rapidity, and just before the outbreak of the recent war they produced 21 million tons of iron ore from Lorraine Annexée and purchased 9 million tons from French Lorraine, from which they made 19 million tons of pig-iron annually. Of the iron ore smelted in German furnaces 58% came from Lorraine Annexée, and with the return of this land to France, the domestic supply will be less than 20% of the capacity of the plants. France received German coke in return for iron ore. In normal times France is compelled to import coal to meet her domestic and industrial needs. In 1913, 43 million tons of coal was mined from the Valenciennes field and 20 million tons imported. Here then was the situation; an iron ore supply coveted by Germany coextensive with Lorraine Annexée, and practically all the coal mines lying immediately south of the Belgian border. The German hordes swept down into France and for over four years the titanic struggle was fought out on the fringe of the mineralized area. Two-thirds of the iron reserves were in the hands of the enemy during the War. It was in order to strengthen the hold on this important asset that the St. Mihiel salient was formed and Verdun attacked in 1916, while the bitterest of battles were ceaselessly waged for possession of Lens, the centre of the coal-field. Both iron and coal mines were worked by the Germans during their occupancy, worked as intensively as their diminishing virile man-power would permit; captive labor was forced to assist, and compelled under threat of death to participate in the wilful destruction, as soon as the inevitable result of the war was realized. The steel works of Lorraine, metallurgical plants planned and equipped with every modern device for efficient operation, were quickly modified to turn out weapons of war during the first year of the conflict, after which, as I shall show, they were dismantled piecemeal; the desirable equipment being transported across the Rhine, the rest destroyed with a deviltry difficult to comprehend. At the south end of the district the steel plants at Pont-a-Mousson were damaged by shell-fire: this town was never occupied by the Germans, but from Briey northward to the Luxemburg line, the wonderful works have been sacked and wrecked beyond recognition. Coal and iron are complementary minerals, the two **grands seigneurs** of the mineral world. From them are fabricated the weapons of war as also the plowshare of peace; with them a nation is strong financially, commercially, and industrially, always, of course, assuming the legitimacy of motive prompting production. Bismarck characterized the former war as one of "blood and iron," the iron of Lorraine was the price of peace, and the industrial association of Berlin and Dusseldorf in 1917 declared to Hertling and Hindenburg that "the annexation of

* We regret deeply to record the fact that Colonel Edouard de Billy was thrown from his horse and killed on June 12 in France.—Editor, M. &. S. Press.

Lens, in April, 1919.

the Briey and Longwy basin is indispensable because the possession of this region is of incalculable value to Germany for economic, industrial, and agricultural reasons, in view of a future war."

In 1913 the 29 iron mines of the invaded section of the Briey and Longwy basins gave employment to 15,200 men and produced 17½ million tons of ore. During the four years following August 1914 the Germans worked the mines intermittently, the shipped all of the ore on the stock-piles to the steel works, and mined at the rate of 30% normal output. The underground workings were not seriously damaged at any of the properties, although many of the surface plants, particularly the miners' dwellings, were razed. The damage is more indirect and the visiting engineer notes that the ore was removed from the most convenient workings; pillars have been robbed near the main galleries, thus threatening the arteries of underground transportation; the extraction of ore without proportionate advance of development headings will postpone the pre-war scale of output for some time; the machinery has been abused for want of lubricants and every ounce of copper, the trolley-wires, motors, brass fittings, as well as all rubber, have been removed. The truth of the story that thunderous applause followed the statement of the Chancellor in the Reichstag denying the shortage of copper was drowned by the noise of the tinsmiths removing the copper-sheeting from the roof of the buildings, is emphasized wherever one goes in the invaded territory.

Unquestionable large sections of the developed areas underground will be permanently abandoned because of the improper mining done by the robbers. At St. Pierremont I was impressed by the extraordinary regard for the welfare of the workmen; hundreds of cases of mineral water were stored at the shaft-station on one of the levels for the Germans to drink, fearing the valiant had copied the vicious and contaminated the water supply!

Iron ore is of no value unless it can be beneficiated. What has happened to the steel plants? Visit Micheville, go to Longwy, ponders the ruins at Mont St. Martin; never a shell was fired here, but the destruction is complete. At the first mentioned plant, M. Nahan, the veteran manager, bowed with the weight of years and tormented by the nighmare of recent events, tells of the conscription of 2000 of his Italian workmen to destroy the model plant. German officers dwelt in his house while he was kept prisoner, presentation bronzes were confiscated for the few pounds of copper they contained, and the plant itself, what of it? All machines that could be moved were shipped to Fatherland, the rest destroyed; it is a mass of fallen stone and twisted steel, a scrap-heap impossible to describe. At the Aciéries de Longwy, the largest steel works in France and employing 7000 men before the War, the ground must be cleared clean that a new mill may memorialize the irrepressible spirit of France. Here one sees train-loads of high-grade steel cut up into movable pieces that were to have been sent to Holland to be turned into shell; the crank-shafts, rollers from the mills, and cylinder-heads were cut with the oxy-acytelene torch or broken by liquid-air cartridges (high nitro-glycerine explosives were getting short toward the end), the boilers were blasted, and the structural steel of the buildings cut at the base, to be overturned. M. Dreux, the managing director of the company, showed me two antique brass candle-sticks on the mantel of his living-room labeled by the marauders and spared to posterity because they were considered 'works of art." Surely such magnanimity entitled Germany to mercy at the peace-table!

The Pas de Calais and Nord coal mines have suffered even more than the iron and steel plants. The damaged area embraces 24 of the 27 concessions; the Gruay mines were not forced to shut-down although damaged by long-range shell-fire and aerial bombs; eight concessions suffered from artillery bombardment and were later pillaged, while toward the eastern end of the district sabotage finds its most glaring expression. Twelve concessions had the surface plants of the many mines completely destroyed wilfully and systematically during the final retreat of the defeated Germans, even as late as October 28, 1918. The coal measures are overlain by water-bearing strata and quick-sands, so that the shafts were sunk by special boring methods and lined with steel cuvellage; this was blasted with dynamite and the mines flooded. Of the 286 shafts 70 were dynamited, 172 are now filled with water, and 235 of the surface plants, magnificent steel structures built with the idea of permamency of operation, are partly, more often totally, destroyed. The few that escaped show the nature of the crime committed, for every building, every head-frame, bears a label giving the estimated quantity of high explosive necessary to wreck it. Many of the steel supports were cut by the oxygen flame and tumbled over into the already flooded shaft. The accompany photographs tells the story better than words. Lens, the centre of the coal-field, is completely destroyed and presents one of the dreariest spectacles imaginable. Near Lens the little river of Souchez was turned into the mines and for part of its course has disappeared, now flowing through the underground workings. Between Gruay and Valenciennes there is widespread, deliberate, and malicious destruction. Bethune, Lens, Courriere, La Bassee, Douai, and other coal-mining centres, are crushed and crumbling ruins.

The problems of reconstruction, reparation, and rehabilitation are many. They are faced with a fortitude, courage, and determination equal to the gigantic task, and they will be solved. France has lost during the War 75 per cent of her peace-time industries, the debts now aggregate three-fifths the total wealth of the country, her young man-power is sadly depleted and greatly exhausted, during the War the deaths exceeded the births by 800,000, but, while materially impoverished, France is morally strengthened, and moral energy is as important as material resource. Full restitution for the wrongs done is impossible except in so far as the allied powers combine to permanently wreck the national industry of Prussia — which was to wage war.

The peace treaty of June 28, 1919, gives to France Alsace-Lorraine, 5,600 square miles, the frontiers to be as before 1871. In part compensation for the destruction of the coal mines, and as reparation, Germany cedes full ownership of the coal mines of the Saar Valley with their subsidiaries, accessories, and facilities. This is but a sop, for if France will beneficiate the additional iron ores of Lorraine she must purchase proportionately larger quantities of coal. The coal situation was menacing before the War; it is now aggravated. In 1913 it was necessary to import 20 million tons, and this when the Valenciennes field was giving its normal output. The whole product of the Saar mines

in actual tonnage, saying nothing of the inferior quality of the coal, is not sufficient to offset the lack of coal from Northern France.

The Saar produces four grades of coal none having the calorific value of the coals of northern France or of Westphalia. They can be used most advantageously for steam and domestic purposes but they are not good coking coals, one ton yielding little more than half a ton of coke, which is friable and of very inferior quality metallurgically. The Saar coal is sometimes referred to erroneously as the economic complement of Lorraine iron. Under German control the iron ores of Lorraine, the coal of the Saar and Westphalia, and the steel plants of all three districts, were treated more or less as a unit industry and most effective exchanges were made by means of the available cheap transportation. It is of vital importance to France that this exchange be maintained under intelligent government control; if coal from Westphalia is withheld the steel industry cannot expand, and either many of the iron mines will remain idle or a great surplus must be exported.

It would be presumption on the part of an American mining engineer to suggest improvements in methods or practice in French mining. The French engineers have long known their own problems and have solved them in accordance with their system of finance. Their mines are developed and equipped with the idea of permanent industry, and unless there is serious labor unrest and extraordinary advances in wage scale, the old French practice is peculiarly suited to French conditions. Their policy is progressive and there is constant search for new mineral areas or extensions of proved deposits. French Lorraine has greater reserves of iron ore than Lorraine Annexee and just before the outbreak of the War drill-holes had shown the extension of the coal measures of the Pas de Calais southward. Iron and coal are complementary minerals. France will have them both in larger quantity than in 1914, and when her reconstruction program is carried out, the steel industry will be among the first assets of a land that has suffered greatly.—Mining and Scientific Press.

PROSECUTION FOR BREACH OF ONTARIO MINE LAW GOVERNING MAN CAGES.

The White Reserve Mining Company, Limited, were fined $100 and costs by Police Magistrate S. Atkinson at Haileybury, on August 4th, 1919, for permitting men to be hoisted on a cage whose sides were not enclosed and which was not equipped with doors as required by the Mining Act of Ontario.

NIPISSING DECLARES DIVIDEND.

At a meeting of directors held in Toronto on Aug. 29 the usual quarterly dividend of 5 per cent was declared. The financial statement showed a substantial cash surplus on hand, in spite of the fact that production was discontinued five weeks ago by the striking of the miners. Surplus assets on Aug. 23, in cash, war bonds, ore and bullion totalled $3,863,386.

Japanese coal output in 1918 was 27,500,000 tons, compared with 21,083,000 tons in 1913, and consumption in 1918 was 25,980,000 tons, an increase of 7,925,000 tons over 1913.

Special Correspondence

NORTHERN ONTARIO.

The Gold Mines.

Reports from the Porcupine field continue favorable. The gold production having reached a point that exceeds any previous record in Ontario's history, and increasing in volume, the outlook for this most northerly of the mining camps of the province is bright. Labor strikes in Cobalt and in Kirkland Lake have released not far under three thousand men a large number of whom are finding their way to Porcupine. Interesting reports continue to come from Northern Manitoba in connection with the new gold find. A fair sized rush of prospectors is taking place and, within the next week or two, more or less detailed information should be available. A number of prospectors from this district are on the scene of the discovery.

With the Hollinger Consolidated Gold Mines now producing gold at the rate of around $7,000,000 annually; the Dome producing at the rate of around $2,000,000 annually, and the McIntyre producing at a rate about on a par with the Dome, it is evident that the combined output of these three gold mines is at a greater rate than ever before established by all the gold producing mines in the province of Ontario.

Official figures confirm the above estimates in so far as they apply to the Hollinger and the McIntyre. In regard to the Dome, while the figures given may be actually about the present rate of output, yet shareholders would perhaps do well not to look upon this as being maintained without variation. It will be remembered that according to official advice presented not long ago in these columns that the directors of the Dome are willing to issue monthly statements just as soon as uniform production is achieved, but that to issue such statements under the present circumstances might lead to erroneous analysis being made.

One fact is made quite clear, however, and that is that gold mining is once more on a fair way to become a profitable business. With the three leading mines rising above the adverse influences, it is considered probable that the medium-sized gold mines will soon follow suit, and that during the coming year all will again be well.

The limited amount of information coming through in connection with the new gold discovery in Northern Manitoba is such as would arouse the interest of prospectors in general. It is stated that the pay-streak in the vein discovered, is about four inches in width and is very rich. What has not yet been definitely learned here is as to whether or not the vein outside of the pay-streak contains commercial gold values.

As is well known in gold mining, narrow pay-streaks are usually found to be erratic and cannot be depended upon as a source of steady output. On the other hand, provided the main body of the vein carries commercial values, the pay-streak even though narrow would serve to greatly increase the average value of the whole. The general impression appears to be that an important find has been made, and the early future will be looked to to justify or refute this impression. In the meantime a fair sized rush of prospectors is taking place.

Cobalt.—General Situation.

The lator situation at Cobalt remains unchanged, except for the fact that more men are leaving the camp for the purpose of finding employment elsewhere. The mining companies show no inclination to change their attitude in so far as the Cobalt Miners' Union is concerned. Through the Returned Soldiers they have offered all workers of Cobalt re-instatement to their former positions and as stated last week have agreed to a system of collective bargaining that would give representation to every worker in the camp through one Central Council, and beyond that they refuse to budge. In a word the only obstacle to a resumption of work and an open discussion of all questions pertaining to labor is the recognition of the Cobalt Miners' Union which the companies declare is but the Western Federation of Miners under a changed name, the latter of which they will not recognize. In the meantime the quotations for silver continue to rise, being quoted recently at $1.15¼ an ounce in New York.

During the month of July, from July 1st to noon of July 23rd, the Kerr Lake mine produced 196,637 ounces of silver valued at over $200,000. This compares with an output of 105,402 ounces for the whole of June.

The McKinley-Darragh has declared its regular quarterly dividend of three per cent, payable October 1st. The disbursement will amount to $67,428, and will be the fourth dividend paid this year.

The McKinley-Darragh went on a dividend paying basis in 1907 during which year a two per cent disbursement was made. Up to the end of 1918 a total of 241 per cent or $5,349,595 had been paid. Added to this is the 1919 disbursements, amounting to 12 per cent or $268,712, including that declared for October first, thus making a grand total of 253 per cent or $5,618,307.

The McKinley-Darragh Company is in the happy position of having earned almost a full year's dividend requirements during the first seven months of the year, and a strike, even though it should last for several months might not seriously impair the financial position of the company.

As a result of no general effort to induce the Ontario government to make arrangements for throwing the Gillies Limit open for prospecting this year, it is feared nothing will be done.

The New Liskeard Branch of the G. W. V. A. took up the question at a meeting not long ago, at which it was decided to submit the following letter to the Hon. G. Howard Ferguson, Minister of Lands, Forests and Mines:—

"This branch of the G. W. V. A. considers the time has now arrived for the opening of the Gillies Limit for prospecting, and that the said Limit should be opened up this fall, Returned Soldiers to have one month's preference to stake claims thereon before others are allowed to stake on said Limits."

(Signed), J. M. Baird,
Sec.-Treas.

Concerning this, not a few returned men have been looking quietly into the possibilities of the Limit, and have volunteered the opinion to the writer that they are confident the Limit would develop in a promising way if opened this fall, thus permitting prospectors to do a limited amount of surface stripping before winter sets in, to be followed by sinking test pits during the winter.

Similar views have been expressed by others, but as yet no statement has been forthcoming that would indicate that the government has lent a sympathetic ear to the proposal. However, it is perhaps not yet too late to press the request, which, if granted, might reasonably result in considerable activity in the more promising parts of the Limit.

Kirkland Lake.—Workmen the Only Sufferers From Strike.

In a number of instances, some of the leading mining companies in the Kirkland Lake gold area are laying plans for remaining idle for considerable time, in some instances until next spring.

The labor strike caught the camp just at a time when, with one exception, the mines were not paying any revenue to their shareholders. The Tough-Oakes had only been reopened after staggering for several years through litigation which had a direct bearing on retarding its development; the Burnside was being explored in a comprehensive way for the first time in its history and is to be merged with annex the Tough-Oakes, thus leaving it in a position similar to the latter; the Wright-Hargreaves had just completed arrangements to instal a big new mill to be completed before winter set in; the Kirkland Lake Gold Mines had just started to produce gold in a small way; the Teck-Hughes had succeeded in treating a tonnage sufficient to indicate that it was at last nearing a point where a fair margin of profit might be realized; while, the one paying mine, the Lake Shore, was working at full capacity and returning dividends at a moderate rate to its shareholders.

To those who are familiar with the situation, it is evident that a number of the mines were soon to begin returning revenue to their shareholders, in spite of the high wages being paid the employees and the abnormal cost of material and supplies. However, now that operations have been curtailed by a labor strike, the concensus of opinion appears to be that the mines as a whole will ultimately yield a larger amount of profit to their shareholders than had they been worked unremittingly during the present period of abnormal costs. With these facts in mind, it will perhaps not come as a very great surprise to learn that such mines as the Tough-Oakes should make arrangements to remain idle until next spring.

This fall should see the macadam road completed as far as the Wright-Hargreaves mine, and with the arrival of next spring the balance of the road as far east as the Tough-Oakes can be soon completed.

Therefore, the indications are that by early next summer the mines will all be in a position to operate at full blast, and probably not handicapped by economic conditions such as exist this year. Therefore, the labor strike appears destined to be responsible for the loss of one year, although perhaps ultimately advantageous to company shareholders. To the workers in the mines and mills it will probably represent a reduction in payroll of approximately one million dollars.

Boston Creek—Government Surveying for Road.

The government is making a survey from Boston Creek station on the T. & N. O. Ry. as far east as the centre of activity in the Skead township gold area according to information just to hand. Prospectors

have travelled most of the intervening territory and believe that they have located a suitable route, and government surveyors are stated to be making a preliminary survey.

According to available information, no serious obstacles are to be encountered and with the exception of building a bridge over the Blanche river, the road, it is believed, may be built at very reasonable cost.

With development work in Boston Creek proving highly satisfactory, and with an excellent prospective area extending all the way east to the east side of the township of Skead, a road some fifteen or sixteen miles in length would pass through a strip of territory which gives promise of containing commercial deposits of gold in various places for the entire distance.

Miller-Independence Mine.

The necessary contracts have been entered into between the Miller Independence and the Northern Ontario Light and Power Company in connection with the electric energy required to operate the new modern mining and milling plant which is being installed this fall at the Independence. A survey has been made, and the route chosen runs due esat from Boston Creek, following a line a half a mile south of the north boundary of the township of Pacaud.

On Monday of this week a contract was let for the cutting of a right of way for the transmission line from the main line at Boston Creek to the mine. This work will be started immediately, and should be completed by the end of September. Cement for new foundations, as well as a large part of the building material is already on the ground.

A meeting of the directors of the company has been called for August 29th.

Examination of Lake Agotawekami Properties.

A recent revival of interest has taken place in the Agotawekami Lake district, situated in the north-western part of the Province of Quebec, a short distance south-east from Lake Abitibi and about twenty-five miles north-east from the Lightning River district.

According to reports just received from that district, Mr. Perry, representing the Timmins interests of the Hollinger Consolidated, has concluded an examination of some of the surface outcrops in that district and has been sufficiently encouraged to secure a large number of mining claims. It is understood the majority of these claims had been staked a couple of years ago following the small prospectors rush at that time, but that for the greater part the assessment duties were not complied with and the territory had been allowed to revert to the government.

The principal showing is said to occur on an island situated close to the mainland, and consists of a large body of gold-bearing quartz. Assays taken from the deposit at the time of the former rush, showed the deposit to be too low grade to be of commercial value. As to whether or not Mr. Perry's examination has met with better results, or that the low values are considered sufficiently encouraging to warrant a reasonable amount of exploration work, has not been made clear.

Industrial Growth in the North Country.

In that territory lying along the Ontario-Quebec boundary, beginning at the south end of Lake Temiskaming, and extending into the far north, destiny is shaping plans that will in time elevate this district to a position of world envy. Just as the great silver deposits of Cobalt, and the gold deposits of Porcupine, Kirkland Lake and Boston Creek have laid the foundation for a beginning, so will the other natural resources in the form of additional mineral deposits, pulp timber, agriculture, water-powers, etc., constitute the basis for the great and lasting future expansion. The Abitibi pulp and paper mill is already one of the largest of its kind in the world. It is situated in Ontario, at Lake Abitibi, and has been established at an estimated cost of perhaps a dozen million dollars. The Quinze water-power, just above the head of Lake Temiskaming, and the development of which is even now under contemplation, is estimated to be sufficient from which to develop upwards of 100,000 h.p. Farther south, or just at the foot of Lake Temiskaming, the Kipawa Fibre Company is completing the first unit of a plant that is being constructed at a cost of about $5,000,000. This first unit is expected to be in operation some time in October of this year.

One of the newer projects is that of big eastern interests who are understood to be making preliminary arrangements for harnessing the outlet of Kipawa Lake. It is estimated that this scheme is calculated to generate electric energy at a rate second only to Niagara on this continent.

In all parts of the world, it has been found that great centres of industry quickly spring up, following the advent of abundance of cheap power. It is believed that in Northern Ontario and in North-western Quebec this same condition will hold good. Accordingly, the contention appears to be well-founded that the boundary towns, particularly those situated along or close to the shores of Lake Temiskaming or the Ottawa River are destined to share great advantages accruing from rapid and extensive industrial growth along the northern reaches of the provincial boundary.

Experimental Ore-Treating Plant—Haileybury Mining School.

Further, that Ontario and Quebec are not going to grow and other provinces lag, is made evident in the detailed information coming from Manitoba, where work has already been started at Little Du Bonnet Falls with the object in view of developing some 160,000 h.p. at a cost of about $9,000,000.

Soldiers' Courses at Haileybury Mining School.

A new Vocational Branch of the Soldiers' Civil Re-Establishment opened at Haileybury, is already a very busy place, over 50 applications for re-training being already applied for.

Any soldier disabled by the war and unable to continue his former work is entitled to retrain in some suitable occupation, and is allowed pay and allowances

amounting to from $60 to $110 per month for a period of six months training. Men who enlisted with the C. E. F., under the ages of 18 years, whether disabled or not, are allowed training in an industry, or a course at school or college, and are allowed a total of $60 per month, in addition to any school or college fees, which are paid by the government.

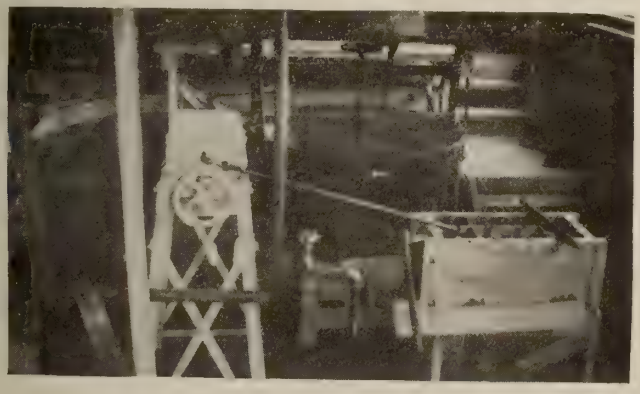
Already a good many men are applying for courses in assaying and metallurgy at the Haileybury Mining School, and some applications for course in business and railroad telegraphy have been approved of.

Major A. H. Smith, who was a resident of Northern Ontario before the war, is in charge of this new office and has lately been joined by Major S. M. Thorne, who will be in charge of placing men with the industries.

Workshop—Haileybury Mining School.

Kirkland Porphyry Makes an Assignment.

The Kirkland Porphyry Mining Company went into voluntary liquidation recently, when M. P. Vandervoort, solicitor for the company, made an assignment in its behalf to F. C. Clarkson. It was stated that the company has no creditors, and that there are very few shareholders. It is expected that a statement of its financial position will be issued next week. This company was prominent a couple of years ago, through a controversy, in which several mining men were engaged, having conflicting interests.



Experimental Ore-Treating Plant—Haileybury Mining School.

New Power Company for Northern Ontario.

A new company, capitalized at $1,000,000, including 5,000 shares of 7 per cent cumulative preferred and 5,000 common shares, has been incorporated under the laws of the Dominion and will be known as the Wendigo Power Company, with head office in Guelph. The company's plant will be located some 20 miles south of Larder Lake. The purpose of this company is the development of hydro-electric power on Wendigo Lake and certain parts of the Blanche River.

BRITISH COLUMBIA.

The Metal Mines.

Victoria.

Some exceptionally fine samples of gold, silver, copper ore from the Premier Mines, Salmon Arm, were brought South for assay by Hon. William Sloan, Minister of Mines, on returning from a tour through the Salman Arm District, British Columbia. The returns, to say the least, are very interesting, being as follows:—

Gold . . . . . $$512.06 per ton
Silver . . . . . 393.2 ounces per ton
Copper . . . . . 3.6 per cent

Figuring silver at $1.10, and copper at 24 cents, the value of this ore per ton would be $952.41.

Some tests of the Fleet Electrical Smelting furnace in the handling of British Columbia magnetite ores are taking place. The Provincial Government has supplied a quantity of ore from Texada Island property for this purpose. One test took place several days ago, being witnessed by the Provincial Mineralogist and other officials. While it was not as successful as might have been desired others it is understood are to be arranged.

Honourable William Sloan, Minister of Mines, has just returned after a trip through the Cariboo District. The object of his tour was to discuss with the miners and prospectors the question of dredging and placer licenses, to the end that the Government might ascertain what is necessary to encourage the opening up of that region. Mr. Sloan is of the opinion that large areas which have been held for many years without development, should be made productive. He found much interest manifested in gold mining throughout the district and believes that while the output recently has not been as large as in the past it will increase in the future. With the Pacific Great Eastern Railway, which now is being constructed through the Cariboo to Fort George, and eventually will tap the Great Peace River country, furnishing transportation facilities, operators will be able to place heavy mining machinery on their property. The Minister of Mines pointed to the fact that men with large experience at dredging operations in the Yukon are going into the Cariboo and investing heavily as being encouraging to the latter district. An instance was that of James Moore, one of the largest operators of the Yukon, who is placing a dredge on Antler Creek. His associates, wealthy Americans, have secured a large tract with promising placer grounds on the Swift and Little Swift Rivers, and preliminary investigations have so satisfied them that they have arranged to install a large dipper dredge. Mr. Sloan also spoke of the activity of the Dominion Government in conducting a geological and topographical survey covering sixteen square miles of that section. This work is centred at Harpers Camp where there is some very promising ground. At present the International Dredging Company has a machine operating with good results. At the junction of the North and South forks of Horsey River a drag line scraper is being put in by Victoria mining interests and the experiment is being watched with interest.

Barkerville, B. C.

The announcement that the Ward-Hopp litigation for possession of the Bullion placer mining property has been finally decided by the Privy Council in favor

of Mr. Ward, has been received with considerable interest in this District. The case has been before the courts for the past five years, during which time the property has been idle. And now that the Court of last resort has given judgment it is expected that the plant will be producing again in a short time. It is reputed to be the largest hydraulicing proposition in the world.

Grand Forks, B. C.

The strike of the workmen employed in constructing a line of railway from Allenby to the Copper Mountain mine in the Canada Copper Corporation having been settled, good progress is being done. Nearly 150 men are working at Copper Mountain building ore bins and getting the mine in shape for producing as soon as the railway and mill are ready for operation.

Messrs. William Thomlison and S. A. Ritchie, the latter being an engineer in the employ of the Consolidated Mining and Smelting Company, recently inspected the Franklin Mining Camp. Mr. Thomlison expressed the opinion that there were a number of first class prospects there and that milling and concentrating plants should be provided by the operators for the treatment of their ore.

Nelson, B. C.

The McAllister mine on the north fork of Carpenter Creek, has been re-opened and Mr. R. A. Grimes, President and Manager of the Slocan Silver Mines, Limited, reports that a shoot of clean silver sulphide ore has been uncovered on the third level. It is over twelve inches wide at the floor and open fan-wise as it rises.

R. S. Lennie, of Vancouver, representing the Nugget Gold Mines Limited; N. T. Burdick Bros. and Brett, Limited, of Victoria and Vancouver; and R. H. Stewart, consulting engineer, have returned from a trip to Sheep Creek where they made an examination of development work in progress on the Nugget. Mr. Lennie has made the following statement:—

"Our visit was for the purpose of inspecting the development which was commenced last March on the combined Nugget and Motherlode properties which were associated by the amalgamation of last year. This consists of a tunnel starting in No. 5 Tunnel of the Motherlode at a point 900 or 1000 feet in. This new tunnel is now through the Motherlode ground and has entered the Nugget ground and has been driven in about 650 feet. It is going in at the rate of eight feet a day, which is about what was estimated at the commencement.

"We are much pleased with the showing made, the work being carried out as originally outlined by Mr. Stewart. We find the underground condition at the horizon on which we are driving similar to that on the upper levels and this confirms us in the belief that we will strike the veins at that depth in the same condition as on the levels above.

"In some instances we were delayed by tough quartzite but we appear to be through that now, and we see no reason why we should not strike the first of the three veins we are driving for about September 15th.

The party also inspected the long bore which A. W. McCune is driving on the opposite side of the creek through the base of the Yellowstone Mountain, to strike the Queen Mine vein in a new depth. This now is in over 1200 feet and the vein is expected to be uncovered in another 300 feet.

Slocan, B. C.

Foreclosure proceedings are to be taken immediately against the Lucky Jim Zinc Mines, Ltd., owners of the Lucky Jim Mine on Bear Lake, in the Slocan District, B. C. It is expected that re-organization will take place immediately to the end that the property may be again put on a producing basis. Senator Landrum McMeans, of Winnipeg, Man., trustees for the mortgagees is responsible for the foregoing statement. Under A. G. Larsen, who acted as trustee, the Lucky Jim produced $200,000, paying off a first mortgage, lifting a floating debt, and making a start on the second mortgage of $35,000. The present action is based on the latter indebtedness. Senator McMeans proposes on acquiring control to place his interest in the mortgage into a new Company in the formation of which the co-operation of former shareholders will be sought.

The Evening Star and Silver Nugget Mines, which have been dormant for years, are to be operated again. William Moore, owner of the California Mine, is supervising the work. Cars, rails and other mining supplies have been forwarded through Nelson, B. C. The Evening Star is situated on Dayton Creek about seven miles from Slocan City. Considerable development has been done on the property and plans have been decided upon for continuing it. The Silver Nugget is situated about six miles from Silverton. This also already has been opened up to the extent of driving two tunnels. A shipment of ore from the Evening Star two years ago ran 347 ounces of silver and $23 in gold a ton while in 1894 a shipment from the Silver Nugget gave a return of $208 a ton, silver then being 57 cents.

Lardeau, B. C.

The same evidence of revival in mining is found in the Lardeau District as elsewhere in the Kootenay and Boundary sections of this Province. The New Era Mining Co., of Vancouver, B. C. proposes placing the old Beatrice Mine, situated near Camborne, on the shipping list. This property was shut down some years ago because of the low price of silver. It is situated on the summit of Lexington Mountain, near the headwaters of Mohawk Creek. The Gold Bug-Rambler Mine is reported to be showing up well under development. A strike just announced is described as consisting of 25 feet of concentrating ore with 18 inches of clean ore on the wall running high in silver with 55 to 60 per cent. of lead and some grey copper. The property is on the south fork of Lardeau Creek, seven miles from Trout Lake City. Some fine samples of clean galena have been taken from the Tenderfoot Group on Tenderfoot Creek. There are three parallel veins on this property which have been developed by about 200 feet of tunnels, the greatest depth being about 50 feet.

Rossland, B. C.

Residents of Rossland are confident that the large concentrator which the Canadian Consolidated Mining and Smelting Company will provide for the treatment of the ores of Rossland Camp will be placed in that City rather than at Trail. Surveys now are in progress and investigation is underway as to the water supply. It is thought that no difficulty will be experienced in meeting the requirement in respect of the latter. In the meantime Rossland, once the busiest mining centre of the Province but recently suffering through the comparative inactivity of the mines in which the community chiefly depends, has taken on a new lease of life and is looking confidently to the future.

Kimberly, B. C.

A forest fire swept away most of the equipment of the North Star Mine, a well-known silver-lead prop-

erty which has been producing for some time. The tram line, some buildings, and necessary plant were destroyed. This is being re-placed as rapidly as the material can be secured and the mine will be shipping again in a few weeks.

Vancouver, B. C.

Monthly returns of the gold bullion received at the Dominion Government Assay Office Vancouver indicate that the output of British Columbia and the Yukon this year is not likely to greatly exceed that of the last twelvemonth, although an encouraging upward tendency in production is noted. A substantial increase is predicted in 1920 when new properties such as those being developed on Sheep Creek begin shipping, when placer ground which has been dormant during the war is made productive, and when the dredging companies, several of which are commencing operations in the Cariboo, are operating. The value of gold bullion received at the Vancouver office from British Columbia last year was $2.178,078 and from the Yukon territory $1,921,197. This, of course, does not represent all the gold produced by these sections of Canada.

A feature of the Vancouver Exhibition, which takes place next month, will be a mineral exhibit of British Columbia ores, which is being assembled by the British Columbia Chamber of Mines. The growing importance of the mining industry in the Canadian West is well illustrated by the increased attention it is receiving on such occasions. The Britannia and Granby Companies will display copper ores; the Surf Inlet Mine will show gold ores; the Drum Lummon Mine and other properties, gold and copper; the Heeley Mines, gold ores; the Bowena Mines, copper and the Consolidated Mining and Smelting Company of Canada will enter a large educational exhibit of minerals.

An organization known as the Vancouver Mining Development Syndicate has been launched with a capitalization of half a million dollars and $100,000 capital subscribed. The object of this Syndicate is to bring mining prospects of British Columbia to the attention of the investing public. The idea is that in the event of a prospector locating a promising property which he lacks the means of opening up he can go to the Syndicate for assistance. The latter then will send competent engineer to report and, if the report is favorable, the propector will be given financial aid. Should the proposition look as well on development as it originally promised it will be placed on the market, a proportion of what is realized to go to the discovered and a share to the Syndicate. Messrs Nicol Thompson, A. M. Whiteside, J. H. Greer, A. H. Wallbridge, and A. Erskine Smith are members of the board of the new organization. They are businessmen of the City of Vancouver.

Trail, B. C.

S. G. Blaylock, who has been Assistant General Manager of the Canadian Consolidated Mining and Smelting Company for the past three years, has been made General Manager of the Company, vice J. J. Warren, who has become its president with favor in mining circles. He entered the Company's employ over twenty years ago, taking a minor position in the laboratory.

Ore receipt in gross tons for the week from August 7th to August 14 inclusive at the Trail Smelter of the Canadian Consolidated Mining and Smelting Company aggregated 7,364 tons. The chief shippers were the Company's mines, the Centre Star of Rossland contributing 1,857 tons and the Sullivan, of Kimberley, 578 tons of lead ore and 2,633 tons of zinc. The Mandy Mine, of the Pas, Manitoba, shipped 498 tons and the Quilp, of Republic Wn., 483 tons.

Salmon River, Portland Canal.

The Big Missouri Group of Claims, Salmon Arm, owned by Sir Donald Mann, is to be developed by means of the diamond drill, the plant necessary already having arrived at the property. The drilling contract has been awarded to Boyle Bros of Anyox, B. C.

Bayonne, B. C.

In the Bayonne District there is much development work underway and a number of promising properties have been from recently. On the Spokane Group the owners are building an Arrastra which their ore will be concentrated by this primitive stone mill. It is to be run by water power and will be completed in the course of a month. Two carloads of ore have been packed out from this prospect in the past two years. It is gold and silver-lead. Good showings also are reported to have been uncovered on the Echo Group and on Diamond Dick Hill.

George T. Jackson, General Manager of the Alaska Gastineau Mining Co.; James Freeburn, General Manager of the Chicago Mining Co., and George Oswell, General Manager of the Ebner Mining Co., have returned after a northern trip in the course of which they inspected properties in which they are interested.

THE COLLIERIES.

O. B. U. Strike Ended. Renaissance of United Mine Workers.

The Fernie strike and the state of idleness which has been a condition throughout the U. M. W. of A. District 18 for almost three months is at an end. For several weeks the coal miners of the Crows Nest Pass, British Columbia, and of the coal mining centres of the Province of Alberta have been restless. It was freely predicted that a break would have to come very soon and come it did. The miners everywhere have declared themselves as loyal to the international labor organization and have discarded the One Big Union.

Mass meetings here at Fernie and later at Michel, which were addressed by Robert Irvine, of Seattle, organizer for the United Mine Workers of America, proved to be the turning point. Resolutions were unanimously passed in favor of the U. M. W. of A. and some days later the men went back to work, it being left to the International to work out a temporary agreement regarding wages that would be satisfactory. Of course the Local Unions now will be reorganized. These presumably will appoint delegates to represent the miners in negotiations with the Company and in the meantime no time will be lost in putting the mines on a productive basis.

The situation is much the same in Alberta. From Lethbridge comes the report that the miners of the Galt Mines voted on the 16th of August "to drop the O. B. U. and to sign up to return to work immediately as members of the U. M. W. of A." With Coalhurst and Drumheller Camps acting in the same way the dispute now may be considered to have been settled

and the fears of a coal famine in the prairie provinces next winter are set at rest.

On the latter point Senator Robertson, Minister of Labor in the Dominion Government, spoke at Calgary shortly before the settlement as follows:—

"You will get coal this winter. I believe that labor should have an equal voice in government and in industry with other interests but influences at work to overthrow industry, confiscate property and destroy government itself shall not succeed. We are backing the international unions which believe in the sanctity of contracts. The Government is satisfied, the United Mines Workers of America will fulfill what they pledge themselves to perform. We are prepared to see the labor forces built up through the international unions so as to make labor an asset and not a menace. I believe the eight-hour day is coming. Labor could be represented in parliament by some 15 members at the present time and it would be for the good of the country that they should be there. Now that the failure of the O. B. U. movement is in sight perhaps greater attention will be turned to the need for labor representation in the House of Commons."

The Mine Operators throughout District 18 are gratified that the strike which has been maintained for so long and seriously threatened one of the most important of western industries has been concluded. They also are pleased that the One Big Union idea has been blasted, feeling confident that it will be possible to make terms with the men through the U. M. W. of A. that will be both agreeable to employer and employed and will be binding, thus rendering some stability to coal mining operations. In this connection a Calgary press dispatch announces that the One Big Union " is held to be illegal under the Criminal Code of Canada, which holds it to be an offence to support any movement which has for its object the overthrow of constituted authority." This statement is attributed to Commissioner of Coal Operators Armstrong, who has been continued in office by the Dominion Government, and by the Operators.

Alberta—The Midland Coalfield of Canada.

At the Industrial Congress recently held at Calgary, Alberta an address was delivered by Dr. Dowling on the coal resources of the Province of Alberta. He said that in the country from the Grand Trunk Pacific to the Smoky River there is as much coal as in the whole of the Province of Nova Scotia. There was estimated to be 1,000,000,000 tons of anthracite which compares favorably with the Welsh product although not as hard as that of Pennsylvannia. The area of Alberta's coal lands Dr. Dowling placed at 25,000 square miles which is in a belt 50 miles wide that runs along the foot-hills, sweeps out to the plains and back to the hills.

James White, deputy head of the Conservation Commission attacked the theory that hydro-electric power is cheaper than steam produced power. Improved types of turbines, combined with new methods of fully utilizing the steam producing qualities of coal rendered the future of hydro-electric power very insecure, especially as applied to the Province of Alberta. Mr. White asserted that, in his opinion, hydro-electric power is not the power of the future for Alberta, notwithstanding its apparent potentialities.

Coal-lands Litigation.—Granby Co. Successful Before Privy Council.

The Granby Consolidated Mining and Smelting Co. has been successful in its appeal to the Privy Council regarding the Cranberry District coal rights on Vancouver Island according to a cable to the company's solicitors in Vancouver, B. C. The issue of this litigation, it should be explained, is the coal in sixty acres of land acquired with other blocks of land some eighteen months ago and in the opening up and operation of which the Granby Company has invested considerable capital. As a result of the company's enterprise what is known as the Cassidy Collieries, the best equipped of their kind in the Canadian West, exist and from this source it is proposed taking the coal to supply the new by-product ovens at Anyox, which will solve the problem of obtaining coke for the large smelting plant at Anyox.

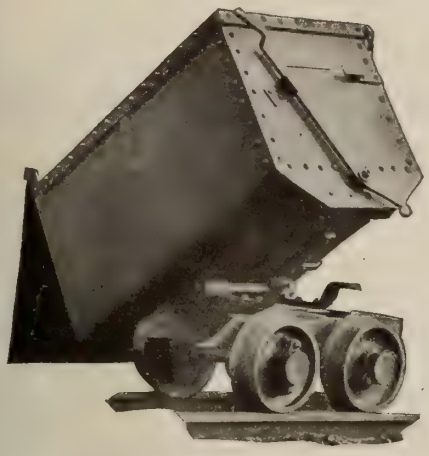
To revert to the matter of litigation, the case which has had a favorable outcome to the Company was brought by a Chinaman, Bing Kee, who asked that he be declared the owner of the coal rights in the sixty acre tract referred to. In 1905 Bing Kee purchased the property from the Ganner Estate, the trustees for which are Angus Mackenzie and Charles Wilson, two prominent citizens of Nanaimo. Subsequently the Ganner Trustees applied for the coal rights and obtained a Crown Grant to them. The Granby Company purchased the Crown Grant from Messrs. Mackenzie and Wilson for $45,000 and Bing Kee entered action to have it declared that his deed included the coal. Unfortunately for him the deed has been lost and the evidence appeared to indicate that only the land was intended to be sold. While, however, Bing Kee's suit is dismissed the Granby Company's troubles in regard to this coal are not ended. Another Privy Council decision affecting the same property continues a lis pendens filed by the E. & N. Railway Company, which claims that the Provincial Crown Grant to Joseph Ganner is invalid on the ground that the same property was granted to the Company by the Dominion Government as part of its subsidy for the construction of the Island Railway. The action of the E. & N. Railway Company has not yet come to trial. The Granby Company applied to the Supreme Court of B. C. for right to register title to the land and the coal purchased from the Ganner Estate but it was held then, and the judgment now is sustained by the Privy Council, that the lis pendens shall continue until the trial. The Granby Company, however, has a third appeal to come before the Privy Council, the contention of this case being that the E. &. N. Railway Company has failed to add the Attorney-General of the Province as a defendant in the suit, it being argued that this is a fatal omission as it is the Crown Grant which he issued which is under attack.

The employees of the Canadian Western Fuel Company will receive an advance of 25 cents a day in their wages as from the 1st of September 1919. This has been announced officially as follows:—

"The request of your Committee for an increase for the employees of the Company on account of the increased cost of living has been given due consideration. To assist in meeting this condition the management will put in effect on September 1st an additional bonus of 25 cents a day. This bonus will remain in effect until such time as the cost of living shall be reduced a like amount.

MINE CARS

We make the kind of Car you want, and make it just the way you want it made.



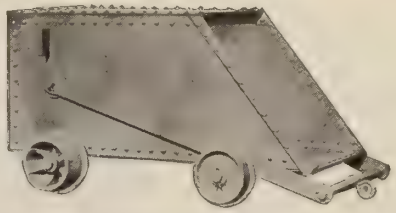
MADE IN MANY SIZES

ROTARY—Will dump at either side or either end

This is only one of the many styles of Mine Cars we offer. Let us know the type of car you prefer, and we will give you attractive prices.

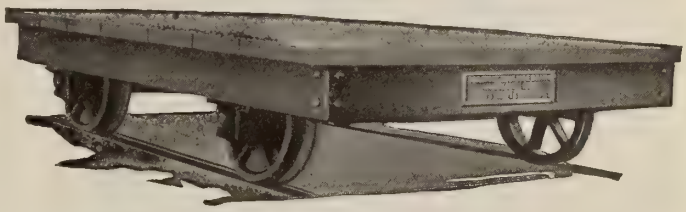
Write for your copy of our new Mining Catalogue Just off the press.

We have been designing and building cars for a quarter of a century. Our designers know their business, and are at your service free of charge.



STEEL SKIPS

For use on Mine Tipple. Made any size to suit your work, and if desired, with double bottom, and rivets countersunk and flush on the inside, to facilitate easy dumping.



HEAVY BU LT PUSH CAR

A good general purpose car for any kind of heavy work. Heavy steel frame work decked with 2½ in. or 3 in. planking. Self-oiling babbitted boxes. Made for any gauge of track, and any required weight to suit the load.

If you use Wood Cars we can supply you with the wheels, Axles, Boxes, etc., so you may build your own cars. You will save money by so doing.

MARSH ENGINEERING WORKS, LIMITED, Established 1846 **BELLEVILLE, Ontario, Canada**

Sales Agents: MUSSENS LIMITED, Montreal, Toronto, Winnipeg, and Vancouver

"In this connection attention is called to the fact that the basic scale for both tonnage and shift rates is higher at Nanaimo than in the competitive districts. The management hopes that it will continue to have the co-operation of the employees in its efforts to increase production and in maintaining the high standard of Nanaimo coal."

D. T. Bulger, of the Dominion Department of Labor, has concluded an inquiry into allegations by some of the miners of Nanaimo District that the Canadian Western Fuel Co. was not paying wage increases granted by the Cost of Living Commission as compensation for the fluctuations in the cost of living prices since September, 1918.

That the men who made this charge misunderstood the situation was learned by Mr. Bulger, who explains it as follows: "For the quarter ending December 31st, 1918, the increase was 2¾ cents a day; for the quarter ending March 31st, 1918, 2½ cents a day; and for the quarter ending June 30th, 1919, 14½ cents, making a total increase since September 30th, 1918, of 19¾ cents a day. Through erroneous statements the impression was gaining headway among the miners that they were entitled to 19¾ per cent increase on their base rate instead of a day basis and consequently many believe that they were being victimized by the companies out of increases to which they were justly entitled."

Neither the Canadian Western Fuel Co. or its employers are parties to the arrangement made last year between the Island Operators and the Mines Committees of the various districts for the adjustment of wages by the Cost of Living Commission based on the fluctuations in the cost of living prices, and for this reason together with the fact that their rates

Oxy-Acetylene Welding and Cutting

This welding repair on broken crank shaft saved an expensive tie-up, at a cost of 50 cents.

Reduces Repair Costs Saves Time and Money

Oxy-Acetylene Welding is saving hundreds of thousands of dollars annually in Canadian Factories, Mills, Mines, Machine Shops and wherever metal or machinery is used. Broken machinery parts, tools and defective castings are quickly and permanently repaired. Many economies and advantages are derived from welding in construction as well as repairing.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones. Provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe, automatic regulators and gauges, and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you. Write for it.

in many instances are higher than those paid in other localities, do not think they should be penalized by paying the increases awarded by the Commission until the rates being paid by other companies are on a par with theirs.

Assurance has been received by Mr. Bulger from the Canadian Western Fuel Co. that any increase in wages by other companies in excess of theirs will be met promptly.

Mine Surveyors Must Be Certificated.

In conformity with an amendment to the Coal Mines Regulation Act passed at the last session of the British Columbia Legislature all plans filed with the Department of Mines hereafter, as provided by the Act, must be prepared by a competent and properly qualified man holding a certificate under the provisions of the Act. From the 1st of October no plans will be accepted unless prepared by a person who has had two years practical experience in surveying mines or is the holder of a diploma in scientific and mining training, after a course of study of at least two years at an educational institution approved, and who is competent to make an accurate survey of the workings of a coal mine and to connect such survey with a surface survey, etc.

REGULATIONS OF BRITISH COLUMBIA C. M. R. ACT CONCERNING WINDING ROPES AND CAGES.

Rule 27 of Section 91 is amended by adding the following:

"All cage chains in general use shall be annealed once at least in every six months, and detaching hooks shall be cleaned and refitted once in every three months."

Rule 28 of Section 91 is further amended by adding the following paragraph:

"Every winding-rope shall be given a bath in hot oil before being installed. Every winding-rope shall be recapped at intervals of not more than six months in accordance with regulations made under this Act, and no winding rope which has been in use for more than two years or which has been spliced shall be used for raising or lowering persons."

COAL PRODUCTION IN ALBERTA.

By the courtesy of Mr. John T. Stirling, Chief Inspector of Mines for Alberta, we have received the following figures of the coal output of Alberta during the first half of the current year, with a comparison of the figures of the first half of 1918, as follows:

1919.	
Domestic	799,724
Bituminous	1,227,988
Anthracite	41,411
Total output	2,069,123
Briquettes	46,822
Coke	14,599
1918.	
Domestic	1,320,143
Bituminous	1,502,031
Anthracite	75,776
Total output	2,897,950
Briquettes	53,424
Coke	17,963

This shows a reduction for the year 1919, which has been caused through labor conditions

:-: EDITORIAL :-:

THE COBALT STRIKE ENDED.

It is with much pleasure that we hear of the ending of the strike of the mineworkers at Cobalt.

No good obejct is to be gained by discussing the causes of the strike now that it is fortunately discontinued, but it may properly be observed that the strike was not justified by any grievances arising out of the working conditions of the industry, and was called to enforce recognition of a labor union alien in origin and alien in policy to the ideals of Canadian citizenship.

The Mine Managers' Association is to be congratulated on the proper stand it has taken and maintained against the political aims of a few men who are more concerned about the extension of the influence of United States labor organizations to the new and opulent mining camps of Canada than they are about the effect of their confessedly political plans upon the economic progress of Canadian industry.

The strike was settled, as this Journal intimated it could only be settled, by a representative committee of men from all the mines affected, a possibility that the Mine Managers' Association always held out.

As is often the case, during the progress of the strike the original leaders found themselves eclipsed by more thorough-going extremists, who became more vociferous as their proportionate numbers were increased by such workmen as were able leaving the district.

Much credit is due to the Returned Soldiers' Committee, which, although its efforts were temporarily nullified by the passing dominance of the radicals—who compelled the miners' leaders to go back on their undertaking—formulated the conditions on which work has been resumed.

It is reassuring to find the tremendous power which is reposed in the organizations of returned soldiers exerted against undesirable importations into Canadian life. The safeguard to the security of our national fabric is brought most clearly into relief where, as at Cobalt, the ideas of the returned men come sharply into conflict with the political aims of men who not being Canadians and having no stake in this country, have nevertheless been successful in temporarily depriving others of their means of livelihood, and in stopping the mining of silver during a period when the need for its production is sufficiently evidenced by the high price the market is willing to pay for it.

THE INDUSTRIAL CONFERENCE.

The provisional lists of those who are expected to attend the conference of representatives of Canadian industrial activities shows a most catholic selection of diversified interests, so diversified in fact that it will be a cheering sign of the times should any common agreement on principles be found possible.

We venture to forecast that the first concrete problem which the Conference will be called upon to consider—and not necessarily to solve, for some things are too difficult even for conferences—is the provision of remunerative employment in some of the pivotal industries of Canada during the coming winter.

If the Conference expends its united wisdom on academic discussion of the very debateable items of the draft agenda, many platitudes will be exchanged, some steam will be blown off by representatives of both capital and labor who will feel that the situation demands eloquence, but the root of the matter will not be exposed.

Canadian industries—that is such industries as serve by assembling the raw materials and manufacturing therefrom some necessary of life, and are not purely engaged in exporting the irreplaceable resources of our country—cannot compete with industries more favorably situated, and unemployment is on the increase.

It is too often forgotten by leaders of labor that some of our most basic industries in Canada, industries whose prosperity or decline involve influences that ramify to every quarter of our economic situation, are really bonused industries, buttressed, and we believe very properly buttressed, by protective tariffs and other forms of national assistance. This in itself is an admission of economic disabilities accompanying the as yet juvenile and undeveloped character of our industries, the geographical position of our coal deposits, and the choice which Canada has made to be an independent political state of North America.

Under these limiting conditions Canadian industry can only prosper by an agreement of both parties to the industrial contract to work together for Canadian interests, always keeping in mind our national limitations, which are opposed to and confronted by an energetic opulent and populous neighbor, a nation possessing unprecedented natural resources, with whom we desire to live in peace, as we have lived for a hundred years, but whose political or industrial guidance we do not accept.

Herein lies the danger of the propaganda of international unionism when it is advocated with such enthusiasm that it loses sight of the struggle which many Canadian industries have had to make, and must still make, to meet the aggressive commercial competition of the United tSates.

The cold truth is that a number of Canadian manufacturing industries, particularly the steel and metal industries, are facing an extended period of unemployment with winter approaching, and the most pressing item upon the agenda of the Industrial Conference at Ottawa is how to lessen the costs of production and how to increase the volume of output, and these vital considerations should take the precedence their actual importance calls for over the relatively secondary and political considerations that form so large a part of the matters now outlined for the consideration of the Conference of next week.

THE CLOSE OF THE STRIKE AT COBALT.

The striking workmen and the Mine Managers' Association at Cobalt, aided by local business interests, following the splendid, though unfortunately unsuccessful attempt of the Returned Soldiers' Committee, to bring about an amicable understanding, have now got together and work at the mines has been resumed, the following statement of the Mine Managers' Association being the basis of agreement:

"To the Committee of Employees, Cobalt:

"Since our recent meeting with you, the managers have carefully considered the points brought forward, and agree on the following statement:

"In regard to the wage situation, the main contention appeared to be that while the bonus system was favorably regarded, you believed the base wage was too low. Your reason for this was that in the event of a considerable drop in the price of silver, the low paid married men could not meet the present cost of living.

"To meet this objection we will strongly recommend to our directors as soon as the men return to work, if they do so without delay, that the base wage be raised fifty cents per day for all occupations and that the bonus start on 80 cent silver instead of on 60 cent silver as at present.

While this does not mean an increase in wages, it does mean an added security against a drop in the price of silver. This change would put the base wage of the miner on a par with the base wage in other large mines in this country and in addition the miner here would receive $1 per shift bonus on the present price of silver.

"Regarding hours of labor, the Ontario Government has enacted that eight hours at the face constitutes a day's work underground. We do not consider that eight hours labor is any more than a day's work. The employers have more to complain of in this respect than the employees, as it is a well-known fact that the efficiency underground has dropped very materially since the war started and this leads to corresponding increase in the cost of production. Consideration must also be given the fact that the Saturday night shift underground usually works five or six hours instead of eight.

The surface men working nine hours are on day shift every day. There is no good reason for changing this, as it is a well-known fact that most men prefer a nine-hour day shift to changing shifts and working eight hours at night. This is no time to talk about decrease in hours of labor. The whole world realizes that the output per man must increase if the cost of living is to come down.

"Regarding Sunday labor, you will realize that there are some operations that must be carried on continuously and also that unless certain jobs are done on Sunday, it would of necessity throw many men out of employment during the week. We have not found that the men employed in these operations generally object to Sunday work if they know it is necessary and in fact we often have applications for such. We shall endeavor to eliminate Sunday labor to a very minimum and if a man objects to it we will try to change him to another job which does not necessitate such work. Also, if a man must work on Sunday he shall have the right to have a day off on compensation during the following week. If Sunday work were paid for on an increased scale, the tendency would be to neglect repair jobs during the week with a consequent loss of employment to the regular workers.

"As soon as possible after a full crew has returned to work we shall ask the men to decide whether they wish to put in operation the plan of collective bargaining already outlined to your committee. Unless it is accepted in good faith by the men, it will not be inaugurated, because it would be a failure without their sincere co-operation.

"The outline of the scheme is as follows: The employees at each mine will elect an Employees' Committee from employees at that mine to discuss with their management questions concerning that individual mine. These several Employees' Committees will elect from their numbers a Central Council, which the companies will recognize as representing the employees of the district. A committee of managers will meet the council and deal with all general questions affecting the camp as a whole, such as wages, hours, and general working conditions.

"This council could very well consider the advisibility of starting a system of sickness insurance and some scheme for lowering the price of commodities to the workers. Both these questions would receive sincere consideration by the companies and it is believed that some satisfactory results would follow.

"It is hereby agreed that all workers may return to work as positions are available.

"TEMISKAMING MINE MANAGERS' ASSOCIATION.
H. H. Kee, President.
3rd Sept., 1919.

Work cannot be immediately resumed, as pumping has, in some instances, been discontinued during the strike and the mines must be relieved of an accumulation of water consequent on the stoppage of pumping and made larger by the steady rains of the past few weeks.

The president of the Mine Managers' Association states that the date of resumption of work will depend on the conditions existing at the individual mines, which will, of course, be dealt with by the several managements as quickly as possible.

"Canadian Mining Journal," with "Iron & Steel of Canada" will be "at home" to all visitors in Booth 138 at the National Exhibition of Chemical Industries, September 28th, at the Coliseum and Armories in Chicago.

It is understood the Patricia Mining Company, Boston Creek, Ont., is in the market to purchase complete new outfit of surface mining-plant and reduction plant to renew the loss which it recently experienced through forest fires, which destroyed all the mine buildings.

Dr. T. L. Walker, Director of the Royal Ontario Museum of Mineralogy, and Mineralogist of Toronto University, is visiting British Columbia. He explains that his presence in British Columbia is for the purpose of obtaining specimens for the Ontario mineral collection and to keep in touch with mining development in this province.

Charles E. Taylor, chief geologist to the Imperial Oil Company, has announced that drilling for oil will be started at once at a point to the southwest of Lethbridge, Alberta. Twelve parties under Mr. Taylor have been exploring the foot-hill section of Alberta since the early spring and as a result the point indicated has been selected as the most likely for the obtaining of the results desired.

Oil In The Western Provinces

By N. C. PEARCE.

Seriously hampered by exceptional weather conditions, drilling work in the Northwest Territories will have to be postponed until next year. This is the latest word from the North. Two drilling rigs were expected to be sinking this season, one at Great Slave Lake, the other on the rim of the Arctic Circle, at Fort Norman on the Mackenzie River.

This summer has been very wet, and to the conditions brought about by heavy rainfall have been added unanticipated troubles connected with getting the rigs around the long rapids of the northern rivers. The Government has sent in bridging and engineering parties to assist the Imperial Oil Company's men and now the best that can be hoped for is that the rigs will be on their locations before cold weather sets in, ready for drilling next Spring. The Great Slave Lake crew will come out this Fall; the Mackenzie River crew will winter in the lonely wastes of the Arctic.

As to drilling, the Summer has had disappointments for the oil men, but the efforts of the many geological parties scattered over Alberta and the North West Territories have been distinctly successful in the amount of good work accomplished. Advance reports from the geologists of the Imperial Oil Company appear to eliminate certain districts and to bring favorable attention to others. The private and Government stratigraphical work is far from completed for the season. When full reports are in there will remain to be done a detailed co-ordination of all examinations.

Meantime, until this co-ordination of reports makes available a full statement of this year's findings, a summary of conditions and developments in the Province of Alberta and the Territories should be worth while.

A great deal of the information for this article was secured by personal investigation on the ground by the writer. Mr. T. O. Bosworth, the Imperial Oil Company's chief geologist, and Mr. C. E. Taylor, their Western production manager; Mr. J. S. Stewart of the Dominion's Geological Survey, Mr. J. B. Tyrrell and others were sources of valuable data and opinion.

Broadly, there are two formations of the Province of Alberta, the North West Territories and certain sections of British Columbia and Saskatchewan that contain oil—the Cretaceous and the Devonian.

These formations are each thousands of feet thick. Throughout the southern and populated parts of Alberta the Cretaceous is the surface, while the Devonian is burried below at depths reaching to 5,000 and 6,000 feet. Well to the north the Devonian comes to the surface, out-cropping first at Vermillion Chutes on the Peace River and down north in the territories it forms the surface over very broad expanses of country.

It will thus be seen that in the populated parts of the west the hopes of oil must be concentrated on the Cretaceous, while in the parts that are difficult of access promise is centred on the Devonian.

In the vicinity of the town of Peace River, a section that has received a great deal of prominent notice in recent months, the Cretaceous is 1,100 feet thick and lies in gentle unconformity upon the Devonian. The drills in several places have explored the Cretaceous with no striking results, and two drills are now penetrating the Devonian with a progress that is, of course, being eagerly watched.

Taking the oil possibilities of the west, district by district, we will examine what investigation tells.

There is little chance of oil being found in the central part of the province of Alberta. In the narrow strip that extends north and south and takes in Edmonton, Calgary and McLeod, the country is in the bottom of a synclinal trough, the strata lies almost flat, while well away to the east, south and west they incline upwards. Deep wells have been drilled in this strip without oil being obtained. The depths of some of these bores are, Morinville, 3,350 feet; Edmonton, 1,800 feet; Wetaskiwin, 1,511 feet; Ponoka, 2,257 feet; Calgary, 3,414 feet; Gleichen, 2,795 feet.

McArthur No. 3 now being Drilled at Peace River.

Traces of oil, however, were found, and gas. No one can say that in this strip oil will be found, but conditions are decidedly against it. What lies below the Cretaceous is practically a sealed book.

Taking now the eastern part of Alberta, some folding has been found in the Cretaceous, which is largely littered with debris of the ice sheet. Those folds, being little exposed, have escaped attention until recently. There is a slight similarity to the oil bearing anticlines of Wyoming and a deep test hole is now being bored by the Imperial Oil Company. This is on a fold near Czar, on a C.P.R. line. The well will be sunk to the Devonian floor, the borings having the additional objective of geological knowledge of the lower stratas. While boring was to have started on this, the deepest hole in Canada, last June, it began only in August. Delay in shipping supplies was the cause. The total cost is estimated at $150,000; a steel derrick, 106 feet high, designed to carry a working strain of 250,000 pounds, has been erected. The hole will begin with 20 inch casing and finish with six inch casing, and will take 18 months to complete.

In this general region a number of wells have already been drilled but it is said that not one is located on a fold. The deepest is at Fusilier, just across the border in Saskatchewan, and it reaches 2,826 feet. There is no sign of structure here. Small showings of oil have been encountered, chiefly at Gratton and Viking.

A promising gas fold has been proven at Viking around a depth of 2,000 feet. There are at present nine wells with fairly large capacity, but not as great as the wells of the Bow Island field. The pressure is 730 pounds and some of them run four to five million feet a day. The extent of the field has not yet been limited and its possibilities are considered very good. There is also the likelihood of other fields being located in the same general neighborhood.

The Frontier Town of Peace River.

Coming down to the south border of Alberta interest naturally centres on the district of the Sweet Grass Buttes. Here there was almost feverish activity early in the war; the Cretaceous strata tilt upward and almost all the beds outcrop. In general the structure is a gently arched monocline, dipping towards the north. In some of the wells traces of gas and oil were found. United Oils No. 3, at Etzikom Coule, 30 miles north of the boundary, is the most important well. It went 3,705 feet and through the Cretaceous into the limestones beneath. At the base of the Cretaceous a 60-foot bed of sand was found, resembling the famous tar sands of northern Alberta. No commercial oil was found but plenty of gas.

To the north thirty-six miles at Bow Island, we find one of the most important gas fields in Canada, developed largely through the energy of Mr. Eugene Coste and his partners. There are here about twenty gas wells, running 2,200 feet deep, with capacities averaging six and a half million cubic feet a day, and with a gas pressure of 800 pounds. This field supplies Calgary and other cities. Medicine Hat has also developed an important gas field.

While the accumulations of gas are without doubt extensive and of great importance, the gas itself is dry. While just now hopes of extracting gasoline from the gas fields of southern Alberta are based on rather slim promise, there is no doubt that this resource will all ultimately be of great value. An interesting fact is the presence of Helium, which is said to be a one per cent content, a percentage comparing very favorably with most of the American gases available for use in inflating airships.

Over in the extreme southwest corner of Alberta, on Waterton Lake, there is the oldest oil-field of Alberta. Twenty years ago seepages were found and several wells drilled to 1,400 feet. In two a fair amount of oil was secured. One, the Lineham, is said to have flowed 100 barrels a day. This summer this well was cleaned out and many barrels of oil baled. Arrangements for drilling a new well alongside this old producer are under way. The presence of oil here is decidedly surprising, for the wells are really within the Rocky Mountains. There is great faulting and overthrusting, the crystalline rocks having been pushed over the Cretaceous. The oil appears in pockets in the older rocks.

Three Creeks Well now being re-opened at Peace River.

Along the foothills of the Rockies we find the Cretaceous tilted upward and crinkled into sharp anticlines. This fold-belt has a width of ten to twenty miles and a length of 800 miles from the boundary northward. Geologists think that this foothill belt is one of the most promising in the west, but it requires

very careful examination. There is excessive faulting, crushing and other disturbance and the structure is often difficult to determine.

Wells placed on the faulted rocks would, of course, be wasted, and wells placed on the anticlines have to be precisely located, owing to the steep flanks of the folds. The outer folds are generally the least steep and the most favorable. As an illustration, the Turner Valley anticline might be mentioned; its dip on both flanks is forty-five degrees, three-quarters of a mile from the axis.

In the foothills some fifty wells have already been drilled, a few of them with regard to structure. These wells cannot be even said to have tested the southern section of the foothills belt, while the Edmonton and Peace River sections are utterly virgin land. The foothill wells are scattered from the boundary to Rocky Mountain House, but cluster chiefly in the Okotoks field, which has five producing wells, with a total yield of about 75 barrels a day. Last year the production was 18,000 barrels of very high gravity oil—some of it almost pure gasoline. The oil is found at 3,000 to 4,000 feet. At the Dingman well there is a high flow of wet gas from which the gasoline is now being extracted by the first plant in Canada.

At this time the most extensive geological surveying in Canada is being done in the foothills. On the work of the Government stratigraphists a half dozen Imperial Oil parties, and several other parties, are basing their examinations. Some very promising determinations have been set down, a number of gas and oil seepages found and numberous anticlines mapped.

Down the river from the town of Peace River for ten miles a number of wells have been drilled. The first was put down in 1915-16 for J. D. McArthur and a syndicate of fifty associates. This syndicate has drilled three wells and the third of these is now into the Devonian limestones. The Tar Island Oil Company have also a well into the limestones, both holes being now at 1,200-1,300 feet. Close to the contact an occurrence of water, highly agitated by gas and in dangerous proximity to loose and crumbling sand, had to be met and defeated. This has been a great problem for the drillers. The Victory Oil Company are putting two wells also down into the Devonian and there is talk of other holes, at present idle, being deepened.

The oil so far secured is in encouraging quantities and from some of them several barrels a day were baled out. One is reported to be capable of twenty barrels daily. It is a heavy, tarry oil, occuring near the bottom of the Cretaceous. A relation with the famous tar sands of the Athabaska has been hinted.

The Peace River field is 140 miles east of the nearest known folding in the foothills. The structure has been mapped three times by geologists, and a very gentle structure with a slight westward dip noted.

The Devonian is not exposed anywhere at the surface in the neighborhood of the field but it is known by geologists that it is almost certainly folded, and to the north it contains oil. The difficulty of course, is to strike folds that are hidden from view.

If the wells were spread much further apart, and the Smoky River section bared, the chances of hitting something around the town would be bettered tenfold.

In a two-hundred mile stretch between the Peace River and the Athabaska there is a good looking field about which little is known but is probably underlain by tar sands.

To come to the tar sands, it may not be generally appreciated that in the vicinity of McMurray on the Athabaska River, Canada has the largest natural oil exposure in the world. But have these sands economic importance?

They exist in a bed of ordinary sandstone, 100 to 200 feet thick, saturated almost completely with heavy, asphaltic oil. It contains 15 per cent of bitumen and yields 15 to 25 imperial gallons of oil to the ton when heated. The oil is low grade, with specific gravity of 25 Beaume, but on distillation it yields five per cent of gasoline. The area over which the tar sands are spread is, at the lowest estimate, 10,000 square miles, and may be more than 20,000 square miles.

Dr. Bosworth makes the very interesting calculation, based on the supposition that the economic elements of the tar sands can be secured and extracted, that the area is 15,000 square miles, the thickness 50 feet, and the yield 10 gallons per ton, that the famous sands contain three hundred thousand million barrels of oil. This quantity is only 500 times the world's annual production.

The thing is to get it, to get it away from the exposures. The Government drilled a test well at Pelican where it was hoped to strike the oil under a thick cover of clay shales. Drilling difficulties caused the hole to be abandoned. That was many years ago; in recent years at least six prospecting wells have tried to find the tar sands under a proper cover of clay shales. Three of these holes were along the Great Waterways railway and encountered the tar sands at 400, 600 and 1,000 feet, respectively. A fourth well at House River found the sands at 400 feet; the fifth and sixth were at Pelican, and at about 900 feet. None of these encountered commercial yields but no one, least the experienced geologist, is ready to condemn the whole region. If drilling for oil fails other methods for utilizing the tar sands will be tried. Gas has been proven here to exist in very large quantities. For twenty years there has been a heavy flow from the Pelican well, drilled by the Government. Later wells have proven it. At present far from population and railways its value lies in the future.

Now to discuss the northern parts of Alberta and the territories which the Imperial Oil hoped to explore with the drill this year but have been prevented from doing by weather and abnormal physical conditions. This is the country where in broad reaches the newer formations have been eroded, and the Devonian bared to view. Near McMurray and Fort McKay wells have been drilled without much success. Beneath the limestones there are thick deposits of red shales with salt and gypsum and the prospect of finding oil in the Devonian of this locality is not at all bright.

The Devonian is also laid bare at Vermillion Chutes, where there was some excitement in 1914-15. The initial venture of the late Lord Rhondda was here and, unfortunately it was not a success. Interests connected with his estate are now visiting the country and there is hope that they will show by new oil enterprises that they are not discouraged. The strata at Vermillion are almost horizontal and are beds of brecciated or fine limestone containing blobs of tar.

On Great Slave Lake are some of the most interesting oil indications in Canada. The shores are largely low and swampy but enough of the structure is visible to make clear that the beds are in gentle undulating

folds. On Windy Point, on the north shore, the most noticeable seepages of oil are found. Here a bed of crystalline dolomitic limestone has cavities containing a light, yellow oil. Oil rises to the surface of the water where the rocks are submerged, and on land are great pools of oil. At present it is not known whether any oil bearing beds lie below the one near surface. That will be determined by the drill next summer. The Imperial Oil men say that in the Great Slave region the oil showings are so widespread that it seems quite probable that oil fields will eventually be developed.

Northward even from here indications of oil are found in many places. Some of the chief seepages occur in the country beyond Fort Norman, on the Mackenzie River at the Arctic Circle, where, through an extensive region, the Devonian consists of deposits very favorable for the formation of oil. There are here 300 feet of black bituminous limestones upon which rest 300 feet of black bituminous shales. The shales smell very strongly of oil and in places there are large cliffs of them undergoing combustion on the surface. This bituminous series is overlain by a series of clay shales and sandstones and it is in these sandstones that the oil occurs. The structure is also favorable for the strata are folded into long, large anticlines. A preliminary test well was to have been drilled this year but is postponed until next spring.

It is considered by very conservative authorities that here, on the Arctic Circle, a number of oil fields must eventually be proved. This is a long way from civilization, and the average person will think that the spending of money a thousand miles inside a land of waste and wilderness is a crazy performance. But shrewd, expert men think the money will be well spent and are eagerly confident that if oil is found that they can get it out. It is a bold enterprise, there is nothing going on in Canada approaching it for daring.

Since the "Shell" Company's vain effort to get the oil monopoly of the north half of Alberta and a piece of the territories equally large, there has been far more interest on the part of the big petroleum people. Although the Imperial Oil Company's prospecting bill for this year will run around a million dollars, they have not got the field to themselves. Other interests have geological parties scouting the country but the nature of their operations makes quietness an easier matter.

Searching for oil is not solely the rich company's privilege. The small company, or the individual, has not the same facilities for checking and examining the geology of a province in one campaign but the same facilities for acquiring land are open. Leases are secured from a Dominion Land office at a cost of 25 cents an acre the first year and 50 cents an acre for subsequent years. The individual is limited to 1920 acres at a time but can secure as much as he wishes by using the names and assignments of relations and friends. Drilling must start at the end of the first year, and the cost of boring is deducted from rentals.

More has been learned this year of the oil possibilities of the Canadian west than during the previous ten years. Oilless areas are being eliminated and promising sections are being circumscribed. Actual drilling operations do not approach, in extent, the hopes of the more optimistic people, but it is most certainly true that great strides have been taken toward the production of a natural resource vitally necessary to Canada's growth.

MINING MEN MEET TO START ASSOCIATION.

Prominent Mining Brokers, of Winnipeg and the Twin Cities Organize.

Plans have now been completed for the formation of a Winnipeg Mining association to represent the interest identified with the development of mining in Northern Manitoba. The first preliminary meeting of those interested in the new association was held some time ago and plans were further developed at a recent meeting. The membership of the new association will include mine owners, owners of mining claims, large shareholders of companies already in existence, as well as brokers and financiers interested in the development of the mineral fields of this province. Another immediate purpose of this association will be to act as a central clearing house for all information as to the development of Manitoba mineral properties and to supervise and censor the issuance of authentic information and publicity regarding the development of the Manitoba mining field.

It is expected that the organization of the association will be completed at an early date then a bureau of information will be established in this city, where the public can seek and at all times secure accurate and unbiassed information regarding Manitoba mineral developments. The first meeting, which was of an informal character, was largely attended.

The officers elected were: President, J. Murray Baird; vice-president, John Beckman; directors, J. Murray Baird; John Connor, secretary Winnipeg Stock Exchange; W. Tobias.

Among those present, were: Edward McCarthy (St. Paul, Minn.), D. D. Shaw, R. R. Pattinson, L. W. Hicks, L. E. Blummer, J. M. Baird, E. W. Jackson, H. B. McTavish, J. D. Perrir, John Connor, N. Tobias, W. Pow, J. W. Harris, H. B. Montgomery, and E. E. Kain, of Minneapolis.

AMERICAN INSTITUTE OF MINING AND METALLURGICAL ENGINEERS.

Chicago Meeting.

September 22nd to 26th the American Institute of Mining and Metallurgical Engineers holds its Fall Meeting in Chicago. The Congress Hotel is designated as the convention headquarters and most of the meetings and technical sessions will be held there. For the gratification of the technical appetites a feast of upwards of a hundred and fifty papers have been prepared for discussion at this meeting.

The first of the social activities during the session will be the smoker at the Congress Hotel on Monday evening, and for this a lively programme has been prepared. The Committee in charge guarantees that at this smoker—in spite of the restrictions against 2¾%—any existing trace of coolness or strangeness between members will be absolutely annihilated. An inviting series of excursions has been arranged for the members and their wives. These include a boat trip to the Gary Steel Mills, one day in the LaSalle district with its zinc smelters, coal mines and cement plants; the East Chicago lead refineries, the oil refineries at Whiting, the tungsten and molybdenum plant of the Fansteel Products Company, the Milwaukee mining machinery manufacturies and the coal mines in Franklin and McCoupin Counties. Also arrangements have been made for the members to visit the various industrial plants of interest in and about Chicago.

Recent Developments In Wasapika Gold Area

By REGINALD E. HORE.

Encouraging results are being obtained by those who are developing gold properties in the Wasapika area, Sudbury Mining Division. Some account of this area was published in the July 9th number of the Journal. I have recently re-visited several of the properties and I found that where work is being done, the chances of developing profitable mines have been considerable improved.

The Wasapika property is particularly interesting as it appears to have the makings of a very big mine. The West Tree is developing a smaller but very rich orebody. It is significant that the vein

The West Tree Headframe.

matter just broken at the 100 level of the Wasapika is very similar in character to the ore that is being taken from the West Tree shaft. I saw no coarse gold where the Wasapika vein was first encountered at the 100 feet level, but the white quartz with its dark sericitic seams and with many small pyrite crystals and occasional grains of chalcopyrite has a striking resemblence to the veins which on the West Tree carry very high gold values I will be very much surprised if rich shoots are not found in the Wasapika deposit. As the cross cut has not yet passed through the vein the thickness and assay value of the deposit is as yet unknown. When the crosscut is completed it will take some time to drift north and south along the vein to develop it thoroughly at this level. Then it must be carefully sampled and assayed. No one knows what the results of samplying and assaying will be, and most people will prefer to wait and see before expressing an opinion as to the nature of the deposit. Being myself more interested in probabilities than certainties, I have formed an opinion after examining the ore and rocks at surface and in the crosscut. It is only an opinion, but it may interest

The Saw Mill—Wasapika Mine.

some readers of the Journal. It is that the underground work so far done indicates that the ore deposit is even bigger than it appears to be on the surface and the surface indications are that it is a big one.

The Wasapika shaft was started in the hanging wall rocks about 80 ft. west of the outcrop of the Ribble vein. At a depth of 100 ft. a crosscut is being driven towards and through the vein. At the shaft there are narrow quartz veins in the rock. Similar

A Glimpse of the Michikawakenda Lake from the Herrick Camp.

narrow veins were cut at intervals in driving east. At about 30 ft. a big vein was encountered and the face was in quartz when I visited the property. When I left the district on August 23rd another round had advanced the opening to a distance of 8.7 feet in the vein.

While development at the shaft is the chief activity at the Wasapika mines, progress is being made in other work. A saw mill is in operation and is proving very useful in squaring timber and cutting lumber

for building purposes. The mill is located close to the Wasapika power house. It supplies the needs of the Wasapika, West Tree and Herrick properties.

Transportation has been improved by the completion of the road to the Herrick property. Supplies for the Wasapika mine are brought to the west shore of Michikawakenda lake from the railway by team and thence by motor boat to the Wasapika. The cost of freighting has consequently been greatly reduced. Low water in some of the streams was causing the freighters much trouble on the water route, much heavier loads can be comparatively easily handled by wagons.

The West Tree

At the West Tree the sinking of the shaft is progressing rapidly under contract. A suitable head frame and power house has been constructed and a hoist installed. The contractors are encountering rich ore in quartz veins in the shaft. Very rich pieces of ore are of common occurence. The quartz is white with dark sericitic seams. The gold is partly along these seams and partly at some distance from the seams in the white quartz. Pyrite is abundant and chalcopyrite is often present in the ore. The pyrite is commonly in well formed crystals, while the more yellow chalcopyrite is in shapeless grains.

While development of the rich ore deposit is at present the chief activity at the West Tree, there are other and bigger deposits that will receive attention later. There is at present a natural desire to learn the nature and content of the rich deposits which have been found on either side of Upper Wasapika Lake and development will in the near future be largely under the lake. With rich ore on either side of the lake and another vein running into the end of the lake from the south, one may confidently expect interesting developments in the drive across.

Mr. Fitzgerald and the First Cores from the Herrick.

One of the Herrick Buildings.

Herrick.

At the Herrick, camp buildings are being constructed and a diamond drill is in operation. The wagon road to the property has been completed and supplies can now be brought in from Westree station on the Canadian National Railway by team at the cost of about 2c a pound.

The diamond drill has been set up west of the Herrick shaft and drilling has been started at a dip-angle of 60 degrees. If the vein continues vertical it should be encountered at a depth of about 450 feet. The drill is in lower ground than the shaft, about 30 ft. lower than the collar. When I last visited it, the drill was turning merrily at a depth of about 150 ft. Mr. Fitzgerald, who has the contract for the diamond drilling is largely responsible for the speed with which the Herrick end of the wagon road was completed. With a first class machine and experienced drill men on the job there should soon be several holes completed that will give information of great value to the owners of the property.

On the Water Route to Wasapika.

A View of the West Tree Headframe and Power House from the North.

Other Properties.

While most of the work being done is at the Wasapika, West Tree and Herrick there are other properties on which some work is being done and several other promising properties which merit attention. At the Atlas, camps have been built and a small force is at work. The Saville-McVittie, a promising property, is still idle. At the Churchill, a little work is being done, but development is not proceeding as vigorously as the property merits. The Gold Corona or Queen of Sheba is also still idle. Prospecting has been begun on the Anzac (now Wakenda) properties which lie north of the Herrick. Further west, a number of claims are being prospected. Walter and John Knox have several men at work on claims west of Michikawakenda lake.

Nova Scotia Notes

Dominion Coal.

The production of the Glace Bay collieries of the Dominion Coal Company in August was 240,744 tons, comparing with 288,781 tons in August 1918. The output shows a slight decrease from the previous month, July which showed a production of 249,396 tons.

For the first eight months of the year the output was approximately 2,029,000 tons, comparing with 2,257,000 tons in the corresponding period of 1918, showing a decline for the year of 232,000 tons.

While the further release of requisitioned ships will permit of more steady working of the collieries during the remainder of the season of open navigation, it does not appear likely that the aggregate outputs of the Cape Breton collieries for 1919 will much exceed three million tons, if at all. With the exception of the strike year 1909, it is necessary to go back to 1901 to find records of production so low as they promise to be for 1919. The Glace Bay collieries in 1918 produced 3,272,000 tons.

The output by collieries during July and August is shown below:

Mine	Aug.	July.
No.1	25,953	26,766
No. 2	47,835	49,756
No. 4	26,117	27,552
No. 5	5,841	6,442
No. 6	17,229	18,712
No. 9	16,406	22,194
No. 10	8,249	8,613
No. 11	13,578	13,031
No. 12	16,365	16,625
No. 14	13,724	11,836
No. 15	12,255	12,527
No. 16	16,660	12,468
No. 21	12,159	11,681
No. 22	12,373	11,193
Total	240,744	249,396

It is understood that a new shaft is likely to be put down by the Dominion Coal Company on the seashore at Glace Bay to serve the submarine territory of Caledonia (Dominion No. 4) Colliery, and also to tap the Emery Seam underlying the Phalen Seam, which is worked out in the land area tributary to the Caledonia Shaft.

The Caledonia Colliery is one of the oldest mines operated by the Dominion Coal Company, the colliery having been commenced in 1866. As an example of excellent workmanship, it may be mentioned that the Caledonia coalhoist was brought from the Gardiner Mines in 1870, after being used there, and is still in daily use. The engine was made by Coupe, England.

The plans for the new shaft indicate the further development that must take place in the Glace Bay and other submarine coalfields in Cape Breton in order to win the submarine coal. Not only much larger shafts, in diameter, but much deeper shafts, will be required in the future, in order to win the underlying and unworked seams. No really deep shafts are as yet sunk in the Sydney coalfield. The shaft contemplated would be about 600 feet to reach the Phalen Seam, the Emery Seam underlying at a further depth of about 160 feet.

A shaft sunk to a depth of less than 1,500 feet near the present No. 2 Colliery of the Dominion Coal Company would include about seven workable seams of coal, aggregating nearly forty feet of coal in total thickness.

The seams are so spaced that they can be worked without seriously interfering with one another, if the workings are properly laid out and ordinary precautions are taken. This section is substantially the same as underlies the workings in the Phalen Seam at Caledonia Colliery, and indeed the whole of the submarine coalfield in the Glace Bay district.

A new shaft, now being sunk, is approaching completion between collieries Nos. 1 and 2, which, like the proposed shaft at Caledonia, is being sunk to facilitate the operation of the submarine areas, and to shorten the distance the workmen have to proceed from the surface to the working face.

Nova Scotia Steel and Coal Co.

The output of the Scotia Collieries for August, compared with August 1918, was as shown below:

	Aug. 1919 Tons.	Aug. 1918 Tons
Princess	14,347	10,454
Florence	18,250	12,884
Scotia	7,544	6,598
Jubilee	10,794	11,521
	50,890	41,457

The collieries worked full time throughout August, the Jubilee Mine being the single exception, and losing only one day.

Coal was banked out to equalise shipping opportunities, but it is expected that stocks will be completely lifted before Winter commences.

At the new mine near Point Aconi coal is now being hoisted to the extent of about 25 tons daily. This quantity will, of course, be increased as development proceeds. So far the coal produced is being stored on the ground awaiting the building of a railway line to the new colliery site.

U. S. Bureau of Mines Auditorium.

OPENING OF N. S. BUREAU OF MINES RESEARCH LABORATORIES.

The new laboratories of the Interior Department's Bureau of Mines at Pittsburgh, costing more than a million dollars, are to be dedicated on September 29, 30 and October 1, with appropriate ceremonies in which the mining and metallurgical industries of the country are to take part. The program for the three days has been arranged by the Bureau of Mines in co-operation with the Pittsburgh Chamber of Commerce.

One of the biggest features of these ceremonies will be the Nation-Wide First-Aid and Mine-Rescue Contest to be held during the last two days. Already nearly 100 teams from the coal and metal mining companies throughout the country have entered the lists and more are expected by the time the entries close.

On October 1, there will be a holiday for the miners of the Pittsburgh district and thousands will attend this National Meet and witness the awarding of the prizes to the winners.

In addition to the usual prizes for these contests, the Joseph A. Holmes Safety Association, an organization created in 1916 in honor of the memory of the First Director, for the purpose of giving recognition to persons who had performed meritorious and heroic deeds in the saving of human life in the mining and metallurgical industry, or who had developed some safety appliance to further the saving of life in those industries, will make its first awards. Dr. Van H. Manning, President of the Association, will announce the list of recipients of diplomas and medals and recite the deeds for which they are presented. The committee on awards has recommended that twelve gold medals be awarded all for heroic deeds performed by miners in coal and metal mines in efforts to save the lives of other fellow-workmen. In several instances where men lost their lives in endeavoring to save others, the medals will be awarded to their nearest living relative. It is the intended that this organization serve the mining industry in the same manner as the Carnegie Hero Commission attempts to serve industry generally.

Speaking of the accident condition generally in the mining industries and of the outlook, Dr. Van H. Manning, Director of the Bureau of Mines, says:

"I am often asked, 'What has the Bureau of Mines accomplished in saving of human life in the mines?'

"It is difficult to say that so many miners might not have been killed if it were not for the Bureau of Mines, there are so many varying factors involved. I may say, however, that if you consider the prevailing average death rate in the mines for a period of years

before the Federal government took up this work, and compare it with the average fatality rate since the bureau was created, you will find that 5,000 less miners have been killed. In other words, had the old fatality rate been maintained through the last few years, 5,000 more men would have lost their lives.

"I am of the opinion that the statement of 5,000 lives saved is a conservative one, for it must be remembered that the situation was gradually becoming worse in the mines, and who knows but what there might not have been 7,000 or 8,000 lives lost. We also have to take into consideration that, thanks to the many improvements in life-saving methods and the greater understandings of the causes of accidents, that the tide has definitely turned and that this saving of 5,000 human beings within a few years will be accentuated and increased as the years roll on until we can show several times 5,000 lives saved.

"Whatever statisticians attempt to make out of these figures, however, they may endeavor to twist them, it is indeed a glorious record of human progress. Five thousand lives saved! Perhaps, 2,000 less widows. At least 3,000 children who still have fathers.

Mr. James McEvoy of Toronto is on his way to the Belcher Islands, Hudson Bay, to examine iron ore deposits.

Special Correspondence

NORTHERN ONTARIO.

The result of development work on the Clifton-Porcupine property in the Porcupine district is arousing a good deal of interest. Work which got well under way only a few weeks ago has already resulted in blocking out considerable commercial ore, according to late reports from the property.

The Clifton-Porcupine is understood to be well-financed, the property being all paid for and with no bonded indebtedness. Ample funds are said to be in the treasury with which to carry out the development program outlined. The interests behind the enterprise have shown genuine ability and intergrity in the past, and it is their belief that their property will develop into a producer.

The property is situated immediately south of and adjoining the Dome Mines. Success at this point would considerably enlarge the so-called Dome area. As a consequence of this the Clifton-Porcupine is the center of more than ordinary interest.

"Canadian Mining Journal," with "Iron & Steel of Canada" will be "at home" to all visitors in Booth 138 at the National Exhibition of Chemical Industries, September 22nd, 28th, at the Coliseum and Armories in Chicago.

Although official advice has not yet been obtained, it is learned on good authority that the Lake Shore Mine has a further construction program under contemplation. It is intimated that the necessary steps may be taken in the near future to prepare for the installation of additional mill equipment at the end of the coming winter.

The present mill of the Lake Shore has a capacity for treating between 60 and 70 tons of ore daily. The grade of the ore formerly treated has averaged around $25 to the ton. Also, the physical condition of the mine is understood to be such as to insure ample tonnage of such high grade ore for considerable time to come. At the same time, as in all gold mines, outside of the high grade usually lies more or less large bodies of low grade. The Lake Shore will probably prove to be no exception to this rule. Thus, instead of mining high grade ore entirely during the early years of its career, and leaving low grade only for the balance of its life, it is the usual practise to provide the requisite facilities for mixing the high grade with the low grade and by so doing place the mine on a production basis that will at once be highly profitable and remarkably uniform.

Opinion seems to be that by so doing the Lake Shore can add to the volume of output, add to the life of the mine and without difficulty go on a dividend basis somewhat higher than the quarterly disbursements of 2½ per cent before the labor strike caused the mine to close.

According to unofficial reports from the Fort Matachewan district the Matachewan Gold Mines Company, owners of the Otisse, have acquired another property lying adjacent to their own. The new property is stated to have previously been controlled by R. Norrington, who is associated with the Allied Gold Mines Company.

A second shaft is being sunk on the Otisse property of the Matachewan Gold Mines Company. The point selected for the new shaft is about a thousand feet from the original workings and along the strike of ore deposition.

The first shaft put down on the Otisse reached a depth of 170 feet some time ago, and, as stated recently, lateral operations are being conducted in three directions at that depth. This work, it is understood, will be continued, the sinking of the new shaft being but an enlargement of the exploration and development program.

In a number of instances, according to present plans, a number of old Cobalt properties which have lain in idleness for the past several years will be re-opened soon after the ending of the Cobalt strike.

The high quotations for silver is having a salutory affect, and, following the re-establishment of harmonious conditions, not only will the big producing mines be operated with increased vigor, but practically every small or idle property will probably be examined with increased care and explored in a manner commensurate to the increased possibilities which they offer as a result of the strong position which the white metal now commands in world finance.

The re-opening of the Porcupine V.N.T. in the near future, and the development of the known series of gold-bearing veins on the west and the north part of the property seems to present possibilities not surpassed by any other property in the Porcupine district, with the exception of the Hollinger, McIntyre and Dome Mines.

Already to a depth of 600 feet the Porcupine V.N.T. has been found to contain large quantities of commercial ore on the main vein worked to date. A series of veins occur in close proximity on which only surface work has been done. Not only does the property border on the Hollinger Consolidated and share similar formation, but it also borders on the Porcupine Crown, the main vein of which dips onto the V.N.T. at depth.

The dividend of 5 per cent declared by the Nipissing Mining Company, payable October 20th, will call for the disbursement of $300,000 and make a total of $19,440,000 paid by this company since its first disbursement on July 20, 1906.

The record of the Nipissing, both in the value of production and in the amount of dividends disbursed is considerably better than any other precious metal mining company in Canada. The company has produced upwards of fifty million ounces of silver during the past thirteen years.

The report issued early in the year showed a very satisfactory ore reserve developed in advance of production, estimated to contain about six million ounces of silver. The company has considerable territory which has as yet not been explored. Also, the financial position of the company is strong, the financial statement issued last week showing a balance of $3,863,-386.50.
